senses, sight makes us know most,” and “whether brute animals have prudence.” For many of the questions d'Afelto starts by putting forward the opinions of Duns Scotus and Antonius – i.e., Antonio D'Andrea, who had published his *Quaestiones in Metaphysicam Aristotelis* in Naples in 1475. D'Afelto then criticizes both these authors and puts forward his own views, based rather on Averroes and Albertus Magnus. His commentary on Averroes's *Prohemium* to his Long Commentary on the *Physics* of Aristotle addresses the problem of philosophical method. D'Afelto tries to reconcile the view of Aristotle, that demonstration was of two kinds – “quia” and “propter quid” – with that of Averroes who believed that there was a third kind: *demonstratio simpliciter*. He does this by suggesting that *demonstratio simpliciter* is really a subspecies of *demonstratio propter quid*. D'Afelto confesses that Averroes's text is difficult and obscure but nevertheless accepts him as the most reliable interpreter of Aristotle. His works make allusion to recent historical events and pour scorn on contemporary philosophers. In his *De fato* he lumps together heretics, followers of Epicurus, and those interested in astrology whom Averroes had attacked in his commentary to the *Metaphysics*, XII, commentum 45, while in his *Lectio prima in Metaphysica*, he rails against followers of all the mantic arts.

D'Ailly, Pierre

Born: 1350, Compiègne

Died: 9 August 1420, Avignon

Fabrizio Conti

Department of History and Humanities, John Cabot University, Rome, Italy

Abstract

Pierre d'Ailly was a theologian, philosopher, and churchman playing a pivotal role in Church reform at the time of the Great Schism and especially at the Council of Constance. He had an intense public career, becoming

Chancellor of the University of Paris, confessor to King Charles VI, a cardinal of the Roman Church, and papal legate, as well as bright intellectual interests spanning theology, philosophy, astrology, cosmology, and geography and producing more than 150 writings. In particular, his *Imago mundi* (1410) was read and annotated by Cristopher Columbus, who derived from it the idea of the practicability of his enterprise.

Alternate Names

[de Alliaco, Petrus](#)

Biography

Pierre d'Ailly was a French churchman, theologian, philosopher, and astrologer. The son of a wealthy butcher, Colart d'Ailly, and his wife Perrine, he was born in Compiègne in 1350 and died on August 9, 1420, in Avignon. The name d'Ailly refers to the town from where the Marguerite, which was Pierre's family name, came from (Guenée 1987). D'Ailly enrolled in the College of Navarre at the University of Paris in 1364, receiving his licentiate in Arts in 1367, teaching on the Bible in 1374-1376 and on the *Sententiae* by Peter Lombard in 1376-1377, promoting the teachings of William of Ockham (d. 1347), and becoming a Doctor of Theology in 1381. A few years later, he was appointed rector of the same College of Navarre, which under his guidance became an important center of humanistic teaching with the active participation of his former pupils Jean Gerson (d. 1429) – who would later succeed him as Chancellor of the University of Paris – and Nicolas de Clémanges (d. 1434/1440), and Jean de Montreuil (d. 1418). D'Ailly became canon of the cathedral chapter of Noyon in 1381, was elected Chancellor of the University of Paris and confessor of King Charles VI in 1389, was appointed Bishop of Le Puy in 1395 and Cambrai in 1397 by Benedict XIII, and was named Cardinal of San Crisogono by John XXIII in 1411. D'Ailly was deeply involved in

the reformation *in capite et in membris* of the Church, writing on the problem in his *De reformatione ecclesiae* as part of a tract *De materia concilii generalis*, and working a great deal to find a solution to the Western Schism (1378–1417) (Pierre D'Ailly 1706). He saw the Schism in apocalyptic and demonic terms, as shown by his *Epistola diaboli Leviathan* written in 1381 (Raymond 1953) in which the devil himself is represented writing to the Church “pseudo-prelates” rejoicing for the division of Christendom. With the purpose of contributing to solve the Schism, d'Ailly attended the Council of Pisa (1409), was nominated legate to Germany by the Pisan antipope John XXIII, and played a prominent role at the Council of Constance (1414), which eventually led to the end of the Schism with the election of Pope Martin V, who sent d'Ailly as his legate to Avignon, where he died.

Elaborating on the thought of the Dominican John of Paris (d. 1306), d'Ailly expressed convinced support to the conciliar theories, claiming that the power of bishops derive directly from Christ rather than from the Pontiff and that the Pontiff himself can err, while only the universal Church, which is represented by the general council, should be considered infallible (Oakley 1964). His apocalyptic views and general preoccupation for the future are some of the main elements at the basis of his pursuit of astrology, which he considers as a science playing a role in both assisting theological discourse – astrology as “natural theology” – and in discerning the order of earthly events (Ackerman Smoller 1994; Ribordy 2011). The relationship between the natural and the supernatural are more fully covered in his *Quaestiones super primum, tertium et quartum libros Sententiarum* (Petrus de Alliaco 2013). D'Ailly's focus is the dialectical relationship between God's omnipotence or *potentia absoluta* and his revealed will or *potentia ordinata*, by virtue of which he freely decided to establish a precise system for the world based on grace. As in Ockham so in d'Ailly the *sine qua non* (or covenantal) causality describes the nature of sacraments, which are not seen as efficient causes of grace since only God himself is such (Courtenay 1971). D'Ailly followed Ockham's

Nominalism in considering the human intellectual limitations to provide proofs for the existence of God. He also dealt with cosmography and astronomy, preoccupying himself with issues ranging from the rotation of the Earth, to the correction of the calendar, and the way to reach the Indies by sea. His collection of treatises entitled *Tractatus de imagine mundi*, written in 1410 and printed in Louvain in 1483, takes its name from the first of that series of texts – the *Imago mundi* – covering geographical, astronomical, and astrological matters, and is well known for its role in the scientific training of Cristopher Columbus, who read and annotated it, absorbing the idea that he was living near the end of time and setting his voyages within that framework (Burton 1930; Bouloux 2011).

D'Aubigné, Théodore-Agrippa

Born: 1552, Pons

Died: 1630, Genève

Véronique Ferrer

Université Michel de Montaigne – Bordeaux 3,
Bordeaux, France

Abstract

Agrippa d'Aubigné is a very prolific author: he composed both love and religious poetries, meditations, satirical tracts, political treaties, historical books, and an autobiography. He is also a man of action, who played a very important part in the Huguenot Party and a soldier who fought with energy against Catholics during the religious wars (1562–1629). He is not a philosopher nor a theologian, but all his works lie on a personal theology which draw on different authorities: the ancient philosophy, the Church Fathers, the reformed hermeneutics, and especially the Calvinist one. To understand Agrippa d'Aubigné's thought, it is necessary to bear in mind the historical context. His religious thought is torn between two opposing feelings: a radical vision of suffering that lives the persecuted Protestants and a theology of hope which gives them the assurance of salvation. Affliction is for d'Aubigné the evidence of the election of protestant people.

From the eschatologic point of view, the afflicted ones will triumph and the arrogant ones will be destroyed. This purifying conception of pain, called tribulation by Paul or "l'épreuve" by Calvin, induces d'Aubigné to justify war and martyrdom, that are the promises of celestial beatitude. The writer also took part in the political discussion about tyranny sharing the "Monarchomaques" point of view that consists of limiting the royal authority if the king exceeds his rights. D'Aubigné is especially in favor of a "monarchie mixte" under the strict control of nobility.

Biography

Agrippa d'Aubigné's life cannot be separated from his involvement in the Reform and to the Huguenot Party. His birth in 1552 in Pons caused his mother's death: that's why was Agrippa (*aegre partus*). From 1568 to 1592, he took part in different religious wars with Henri de Navarre until their quarrel. In 1571, he had a short romance with Diane Salviati, who inspired the famous collection of love poetry, *Le Printemps*, that had never been published before the nineteenth century. In 1577, after his serious wound at the battle of Casteljaloux, he dictates "les premières clauses de ses *Tragiques*" that had been published in 1616. In 1583, he married Suzanne de Lezay. After Henri IV's abjuration in 1593 and after his wife's death in 1595, he retired to his property and devoted his time to his works. Meanwhile, he went on defending Protestants' interests in the different "assemblées" which prepared the Edict of Nantes. After Henri IV's death, he took the struggle again until Louis XIII banished him in 1620. He lived his last 10 years in Geneva, where he married Renée Burlamachi and applied himself to his work without stopping the political struggle until his death in 1630.

Heritage and Rupture with the Tradition

Agrippa d'Aubigné's religious thought is inspired by Calvinist doctrine (Calvin, *Institution de la*

religion chrétienne, Genève, 1536). The profession of faith of the Italian martyr Montalchini (*Les Tragiques*, *Feux*, v. 647–706) gives a summary of his credo, founded on the formula “Seul, seule et seulement” which characterizes this purified religion: only the holy Bible reveals God (*sola scriptura*), only faith justifies (*sola fide*). This is the assertion of God’s power on man’s salvation: “On appelle prédestination le conseil éternel de Dieu, par lequel il a déterminé ce qu’il voulait faire de chaque homme. Car il ne les crée pas tous en pareille condition, mais ordonne les uns à la vie éternelle, les autres à l’éternelle damnation. Ainsi selon la fin pour laquelle est créé l’homme, nous disons qu’il est prédestiné à la mort ou à la vie” (Calvin, *Institution de la religion chrétienne*). According to d’Aubigné, the assurance of salvation is absolute but it implicates the experience of suffering. The affliction is a proof of purification necessary to access to salvation, it is the promise of celestial beatitude. All the religious thought of d’Aubigné lies on a theology of proof and hope, inspired by prophetic and apocalyptic movements, particularly by danielists.

Innovative and Original Aspects

If d’Aubigné is greatly inspired by Calvin’s theology, he combines different authorities – Aristotle, the Church Fathers (especially Augustine and Tertullian), the pseudo-Denys, Hermès Trismégiste, the kabbale, and other marginal religious movements of his time – to such a point that he creates an original religion far from his own confession, between a mystical pantheism, a pragmatic of salvation, and an obvious pessimism caused by the disorders of the history that he likes to describe in his works, in *Les Tragiques* particularly.

Impact and Legacy

The violence and the “rudesse” of his poetry went against the “goût classique” of measure and

elegance defended by Malherbe at the beginning of the seventeenth century. Concerning his radical theological thought, it did not obtain the favor of a pacified century, first in the reign of Henri IV and then in the authoritative monarchy of Louis XIII and of Louis XIV, where Protestants were persecuted. That explains the misfortune of d’Aubigné’s works. Only the Protestants of the “Désert” will recover the prophetic and violent accents of d’Aubigné’s voice. The romantic authors like Sainte-Beuve, Mérimée, and especially Hugo will rediscover his works and will publish them.

Daimon, Renaissance Idea of

Manuel De Carli

Centre d'Études Supérieures de la Renaissance,
Université de Tours, Tours, France

Abstract

The term *daimon*, an ancient philosophical and religious notion, has a broad spectrum. Generally speaking, it indicates a divine being, although not the Supreme Being, to which the function of a mediator is usually attributed. The philosophical fortune of the notion of *daimon* is mainly linked to the history of the Platonic tradition.

The revival of Plato's and Neoplatonists' codices, in fifteenth-century Italy, stimulated the spread of the demonologies that these texts described and commented on. In the framework of the Renaissance demonologies, Marsilio Ficino's demonology is fundamental to understanding the resurgence of classical doctrines on the *daemones*, on the one hand, and the subsequent evolutions of the debate about them, on the other.

During the sixteenth century, the notion of *daimon* would undergo a process of cultural contamination. In many instances, within the general category of *demons*, it would be placed next to the Christian devil or to the spirits of the popular magical tradition. Gerolamo Cardano's reflection represents a turning point in the process of transformation of the notion of *daimon*. When the Counter-Reformation was in full swing, the debate would become extremely heated. In such political and religious context, the very ambivalence of the term *demon* would prove particularly problematic.

Heritage and Rupture with the Tradition

The term *daimon*, an ancient philosophical and religious notion, has a broad spectrum. Generally speaking, it indicates a divine being, although not the Supreme Being, to which the function of a mediator is usually attributed. The term is believed to derive from the Greek *daiomai*, which means "allot, divide." According to this acceptation of the term, the demons would be responsible for allocating the "lots" of fate. In Plato's *Symposium*, for example, this allotting significance is expressed by the *daimon*'s power of conveying to the gods the things that reach the human beings, and to the human beings the things that reach the gods (Cuniberto 2002).

The philosophical fortune of the notion of *daimon* is mainly linked to the history of the Platonic tradition. It suffices to think that an entire current of the Middle Platonic and Platonic demonology

appears as an effort to reconcile the concept of *daimon* found in the *Republic* and the *Phaedo* with the one found in the *Timaeus*. Later on, the rediscovery of the fundamental texts of Platonism – in the Byzantine era first and again later during the Renaissance – fostered the revival of the discussion of the *daimon*. Thanks to the contribution of authors such as Michael Psellus and Marsilio Ficino, the discussion would retain its vitality well beyond the limits of ancient times (Timotin 2012). The revival of Plato's and Neoplatonists' codices, in fifteenth-century Italy, stimulated the spread of the demonologies that these texts described and commented on. In the framework of the Renaissance demonologies, Marsilio Ficino's demonology is fundamental to understanding the resurgence of classical doctrines on the *daemones* as well as the subsequent evolutions of the debate about them (Walker 2000; Stephens 2010).

Innovative and Original Aspects

In the renowned commentary on the *Symposium*, Ficino resumes and elaborates further on the conception of the Platonic *daimon*. The demon is viewed, therefore, as an entity mediating between the superior world and the lower world, operating between the divine and the human (Katinis 2002). Such a discourse is widely developed in the exegesis of Socrates' oration expounded by Tommaso Benci, where he discusses the mixed nature of love, god and demon, and underlines the idea that the *daemones* inhabit "the middle ground between heaven and earth." To confirm this thesis, Ficino makes reference to the words attributed to Diotima in the *Symposium*, to Socrates in *Philebus* and in *Phaedrus*, and to the "Athenian Stranger" in the *Laws*.

Discussing the eternally *living* nature of the entire cosmos, Ficino observes that *daemons* are animate beings that, beneath the sphere of the Moon, inhabit the regions of the eternal fire, of the pure air and the cloudy air. They are immortal creatures but, nevertheless, they are passible,

destined to govern inferior things and human things. They are benevolent and propitious to good men, whereas they are adverse to evil men, to the extent that they can be assimilated to the “Angels, the governors of the lower world” discussed by Dionysus the Areopagite. On the other hand, Ficino points out that he is not concerned, on this occasion, with bad demons, that is, the *kakodaemons*. Rather, he shows interest in establishing two hierarchies of ministers of the cosmic order: the souls of the spheres and stars, on the one hand, and the demons on the other. The former enjoy the vision of God and, according to his will, they rule and move the circles of the world, and can easily govern earthly creatures; the latter, in their turn, are “ministers” of God so that they can operate in the subaltern reality (Ficino 1987).

The “worldly gods,” Ficino continues, serve the ideas of all things that exist in the divine mind, while the demons fulfill the function of intermediaries between the gods and the inferior things, to which they hand the divine gifts bestowed by the angels and the celestial souls. Therefore, the demons – that are evidently related to astral influences – perform the duty of establishing and strengthening the divine gifts and the original endowments (Vasoli 1988). For example, Saturn – through the *Saturnian demons* – strengthens the gift of contemplation. Whereas Jupiter and his demons foster the *gubernandi et imperandi potestas*, the power of governing and ruling, Mars and its *Martial demons* confirm the greatness of soul. The Sun and the solar demons clarify sensations and opinions, while Venus and her *Venerian demons* inspire love. Mercury and the *Mercuriales* promote the skill of exegesis, just as Luna and the *Lunar demons* foster the function of generation. Ficino believes that love can be said to be “divine,” since it comes down from God, and at the same time can be called “daemon,” since it is “confirmed” by “daemons.” Ficino succeeds in developing a further distinction between the *Venerian* demon that, as a “Heavenly Venus,” is placed in the angelic mind, and the demon that, as a “Vulgar Venus,” has the same

generating power as the *anima mundi*, or World-Soul, and finally, the order of demons who are the companions of the planet Venus (Ficino 1987).

Ficino goes back to the theme of the demon/love when he introduces the distinction between five kinds of love in the human soul. Specifically, he defines “demons” two of them: the eternal love of the divine beauty and the love that manifests itself in the mysterious stimulus for generating offspring. In Ficino’s view, they are both naturally good; however, a disorderly use of the latter may induce to *vilia ministeria*, or base pursuits (Ficino 1987).

Since the demons know perfectly well the attraction and the relationship of things, the ancients attributed the magical art to them, as Ficino subsequently recalls. After all, some philosophers were surely familiar with demons, either because of a certain similarity of their nature, as in the case of Zoroaster and Socrates, or because of their adoration, such as Apollonius Tyaneus and Porphyry. By virtue of their relations with demons, such philosophers seemed to be themselves “magicians.” They received extraordinary signs, voices, and portents from the demons while they were awake; as well, in dreams they obtained revelations and visions of demonic origin (Ficino 1987).

Ficino returns to this subject in his commentary on the *Sophist*. This, however, represents an opportunity to discuss the relations between the demons and the technique of human production of images. He explains that the demons mimic the divine action by producing images of things created by the gods. In other words, divine creation is to demoniac production as objects are to their images. As a consequence, *imagines* and *umbrae* – images and shadows – are *quasi daemoniaca machinamenta*, that is, demonic instruments and artifices, operating in a dimension halfway between heaven and earth, between divine and human (Katinis 2002). The demonic nature is halfway between superior and inferior beings, just as the light is halfway between incorporeal and corporeal beings. This is why, Ficino explains, the light has in itself, somehow, a

demonic power, on which depends the existence of images and shadows, the same that appear to men either waking or asleep. Therefore he goes on by stating that imagination acts thanks to a demonic power, through which it creates images (Ficino 1989).

Impact and Legacy

During the sixteenth century, the notion of *daimon* underwent a process of cultural contamination (Maggi 2006; Verardi 2014). According to Cornelius Agrippa, there are three orders of demons or intelligences; supercelestials concerning the divinity only, celestial the demons belonging to the signs, decan, planets and other stars, and demons of the lower world, such as demons of fire, air, earth, and water (Agrippa 1992; Yates 1964).

In many cases, the general category of *demons* was placed next to the Christian devil or to the spirits of the popular magical tradition (Maggi 2001). Gerolamo Cardano's reflection represents a turning point in the process of transformation of the notion of *daimon*.

Cardano provides his own synthesis of the syncretistic conceptions of demons of the Renaissance. The ancients – Cardano recalls – attest the existence of multiple types of guardian spirits. There are spirits that restrain, such as the Socratic one, and spirits that admonish, such as the one that appears to Cicero before his death. There are spirits that instruct men on their future, acting through dreams or through the actions of inferior beings. Similarly, there are good spirits and evil spirits (Cardano 1930). The ethereal presences that inhabit human minds, in Cardano's view, do not depend on subjectivity. Following Plotinus and Ficino, he understands demons as presences residing in the subject's mind, yet they do not correspond to the mind itself (Maggi 2001). In his autobiography, he claims he has had – in the same way as Socrates, Plotinus, and Synesius – an attendant spirit that alerted him to imminent dangers. However, he points out that his tutelary spirit is not under his control and cannot be described (Cardano 1930).

In *De arcanis aeternitatis*, Cardano subsumes different beings under the category of *demons*, such as specter, genius, guardian spirit, and *daimon* (Cardano 1663c), whereas, in the *Paralipomenon*, he explains that demon means “wise man,” thus postulating a basic coincidence between the demoniac presence in the subject and the subject itself (Cardano 1663d). In the *Contradicentium medicorum*, he explains that “two things know in us,” the mind and the demonic presence, which – sometimes – may deliberately convey false and misleading communications (Cardano 1663a). In the *De Rerum varietate*, dealing with Psellus's *De operatione daemonum*, Cardano seems to be certain that Christian theology has neglected the infinite variety of demoniac beings since, like humans or animal beings, demons can be distinguished from one another based on their wisdom and their natural inclinations. Trying to reconcile his Neoplatonic conception with the dogmas of Catholicism, he claims that the evil demons are able to invade the individual's mind and body only because of one's sordid thoughts or negative actions. In other words, evil angels come to the human being because the human being has invoked them (Cardano 1663b).

When the Counter-Reformation was in full swing, the debate became extremely heated. In such political and religious context, the very ambivalence of the term *demon* – which, as we have already seen, could denote either the Neoplatonic *daimon*, or the Catholic devil – proved particularly problematic. Consider that, especially after the bull *Coeli et terrae*, issued by Sixtus V in 1586, the condemnation of the demonic fell either on the necromancers – accused of trading with the devils – or on those who, as atheists-rationalists, denied the existence of demons as fundamental components of the cosmic order (Verardi 2014).

Also, Tommaso Campanella reflected on the ambiguous and multiple essence of the demon. A significant example is represented by his discussion of melancholy (Maggi 2012). In the *Senso delle cose e della magia* (*On the Sense of Things and on Magic*) – arguing against Ficino, who saw in melancholy also an important condition for divination – Campanella believes that this mood

not only is not a reason of sagacity but it can become the seat of evil spirits and of the devil. He refers to the typologies of demons: evil demons and more specifically Christian demons. On the contrary, Campanella underlines, “lucid and pure spirits” are often the seat of angels that operate in the mind by taming and enlightening it. They are good demons, also called guardian angels (Campanella 2007).

Between the end of the sixteenth century and the early seventeenth century, demonologists such as Martin del Rio and Pierre de Lancre insisted on the difficulty to discern the angelic apparitions from the demonic ones, due to the devils’ habit to assume all appearances, to perfectly mimic the divine. Not surprisingly, toward the end of the Renaissance, the inclination to reduce demons into natural agents goes hand in hand with the tendency to represent them as holders of an enormous power of illusion. In this view – although they do not have superior powers when compared to a creature – they are able to mix truth with lie. Through an illusory simulacrum, they shroud God’s creation and, in this way, they obscure its dazzling clarity (Céard 2012).

Abstract

Lambert Daneau (c. 1530–11 November 1595) was a French jurist and Calvinist theologian. His *De veneficis* (1574) featured among the first Protestant demonologies, and he developed the idea of a “Reformed Christian physics” in *Physica christiana* (1576).

Biography

Lambert Daneau was born at Beaugency-sur-Loire, and educated in Paris under François Vatable, Guillaume Postel, and Adrien Turnèbe (1547–1548). Then studied in Orléans and Bourges where he graduated in law in 1559. In 1560, he moved to Geneva, where he studied theology. With a short interruption, he was Protestant minister in Gien from 1562 to 1572. Then he returned to Geneva, where he made a reputation as a preacher and as a professor of theology. Subsequently, he left for a position in the University of Leiden (1581–1583); he also taught in Orthez (1583–1591), and finally in Castres, where he died. In *De veneficis* (Geneva 1574; English translation: London 1575), he provides an account of the nefarious practices of witches and of the “devil’s marks” that betray their true identity. In *Physica christiana* (Lyon 1576;

reprints: Geneva 1579, 1580, 1588, and 1602; English translation in 1578 by Thomas Twyne; the second part appeared in 1582, reprints in 1589 and 1606; and in *Physique françoise*: Geneva 1581), he argued for a Scriptural basis for physics. He is also known for his systematization of Calvinist ethics (Daneau [1577](#)).

Works

The dialogue *De veneficiis* (1574) outlined the agenda of Protestant demonology at the turn of the sixteenth and seventeenth centuries. Daneau developed this discipline principally on biblical sources, and he argued that stating that witches were victims of melancholy amounted to the blasphemous denial that even the victims of demoniacal possession which Christ cured were only melancholics and not actually possessed. Furthermore, he linked the increase in the number of witches to the spread of superstition and false religion which the Reformation was attempting to dispel. Daneau held that the era of miracles had ended in biblical times and that the magic performed by witchcraft through the power of Satan consisted in mere wonders. Daneau also formulated the argument that the Devil, notwithstanding his immense power, could operate only within the limits of the laws of nature. In virtue of this doctrinal line, the crime of witchcraft started to be viewed as primarily a spiritual offense, which consisted in the covenant with the Devil (Daneau [1574](#)).

In Calvin’s view, not only theology, but all other scientific disciplines have a theocratic foundation and a universalistic aim: the glory of God and the christianization of society. Calvin saw no need for a specifically Protestant natural philosophy. Lambert Daneau was among the first Protestant scholars to define the Calvinist standpoint as regards natural philosophy in some detail. He shared the earlier Reformers’ views on the deficiencies of pagan learning. Heathen philosophers were deeply drowned in darkness, for they were destitute of God’s Word, that is, the true light of knowledge. In *Christian Physics* (1576), he developed a natural philosophy based on descriptions

of the workings of nature as found in the Scriptures. The idea of a “Reformed Christian physics,” a Protestant version of the Mosaic physics, was at least partially based on older writings, such as those of the hexaemeric tradition of the Church Fathers (Basil, Ambrosius, Cyrillus) and the medieval schoolmen, and contemporary works, including Levinus Lemnius’ *On the Occult Miracles of Nature* (1561) and Francisco Vallés’ *On Sacred Philosophy* (1587).

Daneau argued that one cannot rely upon the study of nature without knowing Scripture. *A fortiori*, in his view, the Pentateuch provided all necessary knowledge about the Creation. Thus, physics is the true knowledge of the causes by which the creation and the distinction of this whole world and its parts are brought about and of the effects that follow therefrom, serving the glory of God’s works. Daneau preferred Moses to Aristotle. And yet he held that philosophy should approximate the Biblical truth. Thus, he evaluated theories of natural philosophy according to their success in presenting the world as governed by divine administration (Daneau 1576; Fatio 1971, 1976; Laplanche 1991; Ruler 1995; Blair 2000; Goudriaan 2006; Giacomotto-Charra 2019).

Dante Alighieri

Born: 1265, Florence

Died: 1321 Ravenna

Francesco Ciabattoni

Georgetown University, Washington, DC, USA

Abstract

This entry details the life and literary legacy of Dante Alighieri, especially within the complex vicissitudes of the fifteenth and sixteenth centuries. Latin humanism and the revival of classical antiquity vied with the affirmation of Florentine as Italy’s literary language and of Florence as the center of Italian politics. If Dante’s antipapal position and choice of the vernacular caused initial negative reactions,

his *Divine Comedy* soon became a text to be loved or hated, glorified by Florentine elites but placed just below Petrarch's *Rerum vulgarium fragmenta* by Pietro Bembo and many Venetian intellectuals. Many commentaries and series of public lectures contributed to Dante scholarship in the Renaissance, before the fortune of the *Divine Comedy* waned in the seventeenth century, only to resurface in the late eighteenth century.

Biography

Dante (or Durante degli) Alighieri was born under the sign of Gemini (*Par.* XXII 106–20) and probably in the month of May (Boccaccio 2009, *Expositiones* I literal 5) 1265, in Florence. While his family was wealthy enough to grant him an education and means to undertake a political career, Dante's own claims to aristocracy are unconfirmed by other sources. Dante's friend and poetic competitor Forese Donati even alluded to the involvement of Dante's father in money lending and usury.

Dante writes (*Vita nuova* I.ii) of his first encounter with Beatrice (Bice di Folco Portinari), as it happened in 1274, but in 1277 he was betrothed to Gemma di Manetto Donati. Married in 1285, Dante and Gemma had four children: Giovanni (see Regnicoli), Jacopo (1289–1348), Pietro (1300–1364) and Antonia (dead before 1371), who would join the poet in Verona and Ravenna during his exile. After his apprenticeship in grammar and rhetoric with Brunetto Latini, Dante began exchanging sonnets with other Florentine poets such as Dante da Maiano, Guido Cavalcanti and Cino da Pistoia. He spent time studying philosophy in Bologna, as attested by Boccaccio's *Trattatello* (1974, 25) and Giovanni Villani's *Nuova cronica* X.36. The Bolognese notary Enrichetto delle Querce copied Dante's sonnet "Non mi poriano già mai fare ammenda," in which Bologna's tower Garisenda is mentioned, in the *Memoriale Bolognese* of 1287, thus providing a probable date *ante quem* for Dante's stay in the city.

In the summer of 1289 Dante took part in two military campaigns against the Ghibellines of Arezzo (Campaldino, 11 June) and Pisa (Castle of Caprona, 16 August), fighting as a cavalryman for the Florentine Guelfs. On June 8, 1290, according to *Vita nuova* 19, Beatrice died, causing the poet much grief and pushing him to seek consolation in the study of philosophy with the Dominicans of Santa Maria Novella and the Franciscans of Santa Croce. In 1296 Dante was a member of the inner Council of the *Capitano del Popolo* and later of the Council of the One Hundred. By 1297 he had enrolled in the Guild of Doctors and Apothecaries, after Giano della Bella's 1293 Ordinances of Justice made being part of a guild a mandatory requisite to hold political office. Two political factions were forming from the Guelf leadership: the Whites, led by Vieri de' Cerchi and closer to popular participation, and the Blacks, led by Corso Donati and supported by Florence's wealthiest families. Dante sided with the Whites.

In the summer (15 June–15 August) of 1300 Dante was one of the six *Priori*, the highest public office in Florence, and during his term a number of White Guelfs were banned from the city, including Dante's old friend Guido Cavalcanti. In October of 1301 he was part of the Florentine delegation to the Holy See. Pope Boniface VIII would hold him as a forced guest until the early months of 1302. Meanwhile, Charles of Valois, brother of France's King Philip the Fair, had manipulated Florentine politics in favor of the Black party: more White Guelfs were exiled, among them Dante. On March 10, 1302, Dante was sentenced to death in absentia and his properties were confiscated. He took part in a diplomatic mission to Forlì to negotiate an alliance with local Ghibelline forces, but the allied Whites and Ghibellines were defeated in 1303 and again in 1304. During 1303–1304, Dante was in Verona for an extended time and possibly had the chance to visit Padua, Venice, and Treviso. After the death of Bartolomeo della Scala, Lord of Verona (March 7, 1304), Dante moved to Arezzo, hoping for the possible reconciliation of the Whites with Florence. In 1305–1306, Dante enjoyed the protection of the White government in Bologna, but

when the Blacks took over there too, he had to flee and seek refuge in Lunigiana under Moroello Malaspina. Here, the poet worked as an ambassador for the Malaspina family whose liberality he would later remember (*Purg.* 8.121–139). Epistle 4, written in 1307, places the poet in the Casentino region, and a notarial document suggests a long stay in Lucca during 1308. If Boccaccio's and Villani's claims are correct, Dante traveled to Paris, probably around 1309, a journey of which the sole textual indication seems to be a reference to "Vico de li strami" (*Par.* 10.137), the address of the Sorbonne Faculty of the Arts, in Paris. During 1310–1311, Dante passionately followed the Italian campaign of Emperor Henry VII, whose aim was to reestablish imperial control over Italy and especially Tuscany. Epistle X, dating to 1311, places Dante at the Castle of Poppi, in Casentino once again, and he would remain in Tuscany until the death of Henry VII (August 24, 1313). After the emperor's failed attempt to bring order to Italy, Florence offered a pardon to banned citizens who would accept the charges and a fine, but the offer, published on October 15, 1315, expired the next day, making it impossible for Dante to consider it. Dante and his sons were sentenced to death through decapitation. Moroello Malaspina had died earlier that year, so the Alighieri retreated to Verona, at the court of the imperial vicar Cangrande della Scala, where they stayed until 1319. The poet's last home was the court of Ravenna, where Guido Novello da Polenta granted him the respect of a public intellectual. During this time Dante traveled to Mantua, Verona, and Venice. He died of malaria in Ravenna on September 14, 1321, upon returning from an embassy in Venice.

Works

Rime

Dante's earliest lyric production included sonnets in the style of Guittone of Arezzo and poetic exchanges with such poets as Dante da Maiano, Guido Cavalcanti, and Cino da Pistoia.

Unlike Petrarch, Dante never collected all of his poems into a songbook. Even recently, editors

of his poems have disagreed on which and how many to include as well as on the order in which they should be printed. Barbi (Alighieri 1921) attributed 88 poems to Dante and included an appendix of 26 more of doubtful attribution; Contini in 1939 included only the lyrics that were not collected in the *Vita nuova* and *Convivio*; De Robertis (Alighieri 2002a) reconstructs the early circulation of Dante's lyrics and repropose a subdivision by genre as in the 1527 *editio princeps* (*Giuntina di Rime antiche*), but alters its sequence within the blocks; Barolini (Alighieri 2014) offers a chronological ordering and a sensible treatment of previous scholarship, but has so far only published one volume which includes the poet's production up to the *Vita nuova*.

Vita Nuova

Around 1293–1295, a young Dante who had exchanged poems with Florence's most reputable poets collected 31 of his own lyrics into a narration of his love for Beatrice, the salvific woman whose death in 1290 is at the core of this work. The protagonist is Dante himself, who undergoes shock, depression, and finally a new experience of writing the love lyric. Borrowing from the form of the Provençal *vidas*, which combined lyrics and biographical accounts of their authors, and from the tradition of courtly love towards a Christological interpretation of Beatrice, Dante inserts theological elements into the narration, thus transforming the popular Italian love lyric into a personal account of his "new life." The fortune of the *Vita nuova* during the Renaissance was not comparable to that of other Dantean works: as already noted by Barbi (92), the *Vita nuova* was not read or copied during the fourteenth and fifteenth centuries. However, it was included in the *Raccolta Aragonesa*, the collection of 480 texts that Lorenzo de' Medici sent to Frederick of Aragon in 1477, but not without Angelo Poliziano remarking on Dante's "antique coarseness" in the prefatory letter.

De Vulgari Eloquentia

In the early years of his exile (1302–1305), Dante set out to write a linguistic treatise in Latin to identify the noblest form of Italian vernacular. We only possess two books of the incomplete "On

Vernacular Eloquence,” but we can infer that Dante favored the Florentine, Bolognese, and Sicilian forms of Italian. The author displays an impressive knowledge of different vernaculars and literary texts from Occitan to those of northern and southern Italy. Dionisotti (1965, 344) notes that at the beginning of the fourteenth century, the *Vita nuova*, the *Convivio*, and the *De vulgari eloquentia* were almost entirely forgotten: no manuscripts were copied and nearly no mentions of these works punctuate the pages of the humanists, more interested in the recovery of the classics than the theological vagaries of a medieval exile. The *De vulgari eloquentia* had remained virtually unknown and even misattributed (by Giambattista Gelli) until Gian Giorgio Trissino’s translation into Italian fostered a critical discussion on the vernacular among Italian intellectuals (Montuori 310), and Jacopo Corbinelli reestablished Dante’s paternity in his Parisian edition of 1577.

Convivio

Composed around 1304–1307, the *Convivio*, or “Banquet,” was left unfinished after just four of the intended 15 books. Dante’s philosophical treatise was nearly forgotten in the first half of the fifteenth century, but enjoyed a certain popularity from the 1460s onward and was printed in 1490 by Francesco Bonaccorsi in Florence. The first book is a proem and the only one that does not begin with a canzone. It contains a passionate defense of Italian as a worthy language for literary and philosophical writing. The second and third books deal with the author’s consolation found in the study of philosophy after the death of Beatrice. The fourth book treats true nobility, based on character and not birthright. The influence of scholastic philosophy is evident in the treatise, but the choice of Italian instead of Latin for a philosophical work offers the bread of the angels (i.e., philosophical knowledge) to a larger readership (I.i.7–8). The *Convivio* announces Dante’s disaffection from his first love Beatrice, and the shift in his affection toward Lady Philosophy (II.xv.2); but the work was interrupted just around the time that Dante began writing the *Divine Comedy*, in which Beatrice’s return heralds the triumph of Christian theology.

Epistles

The 13 letters we possess were written by Dante to Niccolò Albertini, Bishop of Ostia, and Velletri (I); Oberto and Guido, Counts of Romena (II); Cino da Pistoia (III); Moroello Malaspina (IV); the Rulers of Italy (V); the most iniquitous Florentines (VI); Emperor Henry VII (VII); to Marguerite of Brabant, in the name of the Countess of Battifolle (VIII–X); the Italian Cardinals (XI); to a Florentine friend (XII) and to Cangrande della Scala, Lord of Verona (XIII). The last of these letters, to Cangrande, has been the object of much critical attention because it contains a set of interpretive instructions for the *Divine Comedy*. Doubts on its authenticity have lately been minimized (see Azzetta) but not entirely silenced. During the Renaissance, Dante’s *Epistles* were variously debated, in 1436 by Leonardo Bruni (1917), in 1467 by Giovanni Mario Filelfo (1828), by Anton Francesco Doni (1547), and by Giambattista Gelli (1562). Bruni described the poet’s handwriting, having read some of his letters, as “fine and slender and very accurate” (Toynbee 1917, 5).

Quaestio de Aqua et Terra

On January 20, 1320, Dante gave a lecture in Verona on the relative size and position of water and earth on our planet: The “Dispute on water and earth” was the result of a debate begun in Mantua in which Dante argued that the earth was everywhere higher than water. The text was first published by Giovanni Moncetti in 1508 (Barbi, 103), and its authenticity was debated until Edward Moore made a case for it in 1899.

Monarchia

Written around 1312–3 or 1319–20, this Latin treatise in three books passionately defends the autonomy of imperial power from its papist adversaries, arguing that the rule of an independent emperor is necessary to the pursuit of man’s happiness. It is ironic that the *Monarchia*, a treatise that promotes imperial authority and denies the papacy temporal power, was first printed in 1559, the very year of Paul IV’s promulgation of the *Index of Prohibited Books*. Its inclusion on the *Index* would not allow for Italian publication,

and the text's first printer, Joannes Oporinus – based in Basel, a city outside the borders of Catholic influence – thought that the author of the *Monarchia* was not the poet of the *Commedia* but a homonymous friend of Angelo Poliziano (Kay, xxxv). The interest of the Lutheran world in Dante's antipapal pamphlet was confirmed in the same year by Johannes Basilius Herold's German translation from Marsilio Ficino's Italian version of 1468.

Eclogues

Between 1319 and 1321 Dante composed two Latin poems (of 68 and 97 hexameters, respectively) in response to the Bolognese magister Giovanni del Virgilio who invited him to write in Latin instead of Italian and move to Bologna to receive the poetic laurel. Dante replied that he would rather pursue a quiet life of study and write in Italian than move to Bologna to write in the language of Virgil. First printed in 1719, Dante's *Eclogues* testify not only to his ability in Latin versification, but to his consistent agenda of pursuing excellence in the vernacular.

Divine Comedy

Dante's given title was *Comedia* (*Inf.* 16.128 and 21.2), a work that blends classical poetry with Christian theology, approaching the basest Infernal subjects and the loftiest heavenly mysteries in the Florentine vernacular, but with influences from Occitan, Latin, and other varieties of Italian. The poem's style ranges from bawdy and grotesque to realistic and elevated, rich with neologisms; to early readers it appeared at times slangy, uncouth, and even shocking. However, echoes and reminiscences of Dante's verses surface in many writers including Petrarch, Boccaccio, Poliziano, Savonarola, Ariosto, Trissino, Folengo, and Michelangelo (Bigi 1981a, 160, 163, 1981b, 179). Dante's *Commedia*, written in *terza rima* (tercets rhymed ABA, BCB) is divided into one hundred cantos grouped into three canticles (*Inferno*, *Purgatorio*, and *Paradiso*), recounting the protagonist's journey (that of Dante Alighieri himself) through the Christian afterlife, where he interacts with a vast array of

historical and literary figures, prominent and otherwise.

Heritage and Rupture with the Tradition

The first biographer of Dante was Giovanni Boccaccio who, in his *Trattatello in laude di Dante* (extant in three versions), presents a eulogy of the poet, having researched the facts and interviewed those who knew him, among them Dante's daughter Antonia. As a great admirer, copyist, and editor of Dante's works, Boccaccio's aim was to cleanse the poet's reputation from any residue of political or moral bias that might be lingering in Florence after his exile, and to cast poetry as the highest means to attaining theological truth. Despite his effort toward objectivity, Boccaccio's life of Dante is notorious for its unreliability, presenting an idealized image of Dante's person and little evidence to support many of its claims; thus, when Leonardo Bruni wrote his own biography of Dante in 1436, he distanced himself from Boccaccio's romanticized and mysticizing approach. Significantly reassessing Dante's civic engagement and literary value with respect to his 1401 *Dialogues to Pier Paolo Vergerio*, in which he criticized Dante's inferior Latinity (Quint, 427), Bruni, now chancellor of the Florentine Republic, while recognizing the linguistic superiority of Petrarch, celebrated Dante's role in the birth of Florentine humanism.

Other biographical accounts of Dante include Giannozzo Manetti's 1440 *Vitae Dantis Petrarchae ac Boccaccii*, which shifts interest toward the contemplative aspects of the poet's life, and Matteo Palmieri's *Città di vita* (ca. 1455–1465) which completely abandons the view of Dante as a model of the civic poet and focuses instead on the style and structure of his great philosophical poem, even extolling Dante's ennoblement of the vernacular (Garin, 20–21). In this philosophical wake, Marsilio Ficino translated Dante's Latin treatise *Monarchia* into Florentine in 1468, tracing a neo-Platonic interpretation of Dante, later restated in Ficino's introductory epistle to Landino's 1481 commentary on the *Commedia*. Here, the prestigious iconography of the poet as Florentine civic glory combines with the neo-Platonic vision of poetry

as earthly image of divine harmony and sublime cognitive tool of theological wisdom. For Ficino and Landino, the goal of the soul's journey, allegorized in the pilgrim's journey, is contemplation of divine matters.

Impact and Legacy

Soon after Dante's death, controversy arose around his political ideas. The poet's strong support of the empire scandalized papal supporters across Italy: Guido Vernani da Pisa wrote a polemic refutation titled *De reprobatione monarchiae* in 1327, and Cardinal Bertrand du Pouget ordered the book burned in Bologna in 1329. Shortly after, however, Dante's fortune would grow, especially in Florence: Giovanni Boccaccio began lecturing on the *Divine Comedy* in 1373 (*Esposizioni sopra la Commedia*, running only through *Inferno* 17 because of Boccaccio's declining health). Boccaccio also copied many of Dante's works and composed his first biography (*Trattatello in laude di Dante*, extant in three versions). Dionisotti (1965, 337) points to the tradition of Dantean readings as evidence that the *Divine Comedy* had become, by the late fourteenth century, a canonic Italian literary text. Readings of Dante's *Comedy* took place in several northern Italian cities by Giovanni Villani, Benvenuto da Imola, Giovanni Malpaghini, and Giovanni Gherardi da Prato (Garin, 12; Rossi, 309; Arduini 7), but the most controversial cycle was certainly the 1431–1432 Florentine readings by Francesco Filelfo, which provided the grounds for the anti-Medicean political campaign of the Albizzi and the Strozzi. A scholar from Tolentino in the Marches, Filelfo, who had come to Florence after Venice and Constantinople, appropriated Dantean ideals of liberty to the republican cause of Rinaldo degli Albizzi and Palla di Noferi Strozzi, provoking the violent reaction of Cosimo de' Medici the Elder. In retaliation, Cosimo had his thugs attack and disfigure Filelfo, leaving a mark not only on the scholar's face but also in the history of the reception of *Commedia*: in Florence, Dante had become a valuable icon and legitimizing stamp for ambitious political agendas.

Florentine humanists of the late fourteenth century such as Cino Rinuccini and Coluccio Salutati

returned to Dante with an interest that was only partly diminished by the fact that Dante's majestic poem of heaven, earth, and hell was not written in the language of Cicero. This waxing and waning interest occurred, after all, in the wake of Petrarch's mild appreciation of Dante's excellence in the vernacular, too dear "inter ydiotas in tabernis et in foro" ("among vulgar people in taverns and town squares" *Fam.* XXI.15.15), a prejudice that did not die easily, if even Leonardo Bruni's positive assessment could not refrain from noting Dante's limited Latin eloquence (Bruni, *Vita*, par. 12). The debate at the turn of the fifteenth century broadened when some humanists, enamored of the Latin language, disparaged the *Divine Comedy*'s vernacular. Rinuccini's *Invettiva contra a certi calunniatori di Dante, Petrarca e Boccaccio* responded to Antonio Loschi's *Invettiva in Florentinos* taking the defense of Dante, Petrarch and Boccaccio; Angelo Decembrio relayed, in his *Politia literaria*, his teacher Guarino da Verona's harsh judgment of vernacular literature as mere fable fit only for women and children; Leonardo Bruni's 1401 *Dialogues to Pier Paolo Vergerio* featured Niccolò Niccoli, the most strenuous opponent of the vernacular, reproaching Dante for punishing Brutus and Cassius by placing them in Lucifer's jaw along with Judas, when they should have been praised for killing the tyrant Julius Caesar. This episode frames the political discourse of republican Florence, justifying tyrannicide as a way of defending republican ideals, a concept that would survive there until the French Revolution. The second part of Bruni's *Dialogues* contains a marked change of perspective, with Niccoli acknowledging the literary value of the Three Crowns; however, this concession remains a rhetorical device and does not reflect Bruni's true acceptance of the ethical, philosophical and literary values disparaged in the first part of the work (Bigi 1981a, 150). Bruni's *Dialogues* also continue the criticism of Dante's choice of the vernacular as a new literary language, a choice that had already been covertly criticized by Rinuccini and Salutati (Garin, 9), who in *De fato, fortuna et casu* had even translated into Latin portions of *Inferno* 7 and *Purgatorio* 16.

In the following decades, after the war with Milan and the ascent to power of Cosimo I (the “Elder”), Florence developed a cult of Dante that rested on the poet’s civic and political activity. Leonardo Bruni’s *Vita* not only insists on Dante’s civic commitment, but even justifies and supports his choice to write in the vernacular instead of Latin. This attitude became dominant in the Renaissance: Dante was often appropriated by one ideology or another and was even bent to the purposes and necessities of entirely diverse intellectuals. With the coming of the Lutheran Reform, at a time of deep religious crisis and renovation, Dante’s antipapal inclinations were construed as the forerunners of spiritual rebirth, a witness of truth, a poetics of the Reformation (Dalmas, 40). The end of the fifteenth century was thus characterized by a renewed interest in Dante’s political and moral stances, although the debate regarding the excellence of language was soon to turn in favor of Petrarch. With the publication in Venice of Pietro Bembo’s *Prose della volgar lingua* (1525), the linguistic models for the Florentine vernacular were Petrarch’s verse and Boccaccio’s prose. The edition of Boccaccio’s *Decameron* and the *Giuntina di rime antiche*, both published in 1527 by Giunti in Florence, testify to Dante’s secondary position as vernacular model at a time when Florentine was exalted as the new literary language of Italy.

And yet, the Accademia Fiorentina, sponsored by Grand Duke Cosimo I, began its cycle of Dante lectures in 1541 with such distinguished names as Giovanni Mazzuoli (nicknamed Lo Stradino), Anton Francesco Grazzini (nicknamed Il Lasca), and Benedetto Varchi. In 1547, Anton Francesco Doni collected lectures by more Florentine *Accademici* – Francesco Verini, Giambattista Gelli, Giovanni Strozzi, Pierfrancesco Giambullari, Cosimo Bartoli, Giambattista da Cerreto, and Mario Tanci – in his *Lettioni d’academici fiorentini sopra Dante*, testifying to the lively interest in the theological, political, and poetical aspects of Dante’s *Divine Comedy*. Over time, the many unorthodox or anticlerical passages in Dante’s *Divine Comedy* authorized a number of ideological readings and appropriations of the cultural icon that the Florentine poet

came to represent. Indeed, these unorthodox appropriations were not mere passing fancies of the moment: “the heterodox use of the poet is less strong than the text might indicate, but also more lasting than the history of censorship suggests” (Dalmas, 257).

The constitution in Padua of the Accademia degli Infiammati, in 1542, issuing from Pietro Bembo’s pro-Petrarchan aesthetic and Pietro Pomponazzi’s neo-Aristotelian rationalism, represented a strong reaction to Florentine “Dantismo.” Intellectuals such as Girolamo Ruscelli (d. Venice, 1556) and Bernardino Tomitano (Padua, 1517–1576) sparked the controversy by criticizing Dante for being more a theologian and a philosopher than a real poet, and for using lowly expressions and coarse language in his verses. These attacks opened a first phase of the *querelle* over Dante, with the anonymous 1556 *Difesa di Dante come cattolico* (attributed by some to Vincenzo Borghini), followed by Carlo Lenzoni and Benedetto Varchi who also argued in defense of Dante. Pierfrancesco Giambullari, Girolamo Benivieni, and Lodovico Dolce (whose 1555 edition of the poem adds for the first time the adjective “divina” before Dante’s intended title *Commedia*) all sided with the Florentine poet and the excellence of his poem. The debate seemed settled until Varchi’s dialogue *L’Ercolano* was published posthumously in 1570; in it, the author extolled Dante as a superior poet to Homer and Virgil, stirring a second round of reactions. An unidentified author under the pseudonym of Ridolfo Castravilla (possibly Lionardo Salviati or Bellissario Bulgarini) slighted the divine poet with the inflammatory *Discorso nel quale si mostra l’imperfezione della Commedia di Dante*. Moving from the Aristotelian principle that philosophy and poetry cannot be successfully combined in a work of art, Castravilla found many imperfections in the *Commedia*, including its style, content, logical construction, and storyline. He disparaged Dante’s poem as a satire, rather than a comedy, “a messy mix of the lectures he might have heard from this or that friar.” Among those who rose in defense of the Florentine poet, Iacopo Mazzoni’s *Discorso in difesa della Comedia del divino poeta*

Dante (1572) most effectively countered Castravilla's argument that Dante had barbarously mixed poetry with philosophy stating that "removing philosophy from human reasoning is tantamount to removing the shepherd from the sheepfold" and that "poetics and philosophy are one and the same thing" (Battaglia 7). The dispute continued for years, counting among Dante's adversaries Alessandro Carriero (*Breve et ingegnoso discorso contra l'opera di Dante*, 1582), Bellissario Bulgarini (*Considerazioni sopra il discorso di Iacopo Mazzoni*, 1573; *Repliche*, 1585), and Orazio Capponi (*Risposta alle cinque prime particelle delle Considerazioni*, 1575) while Dante's defenders included Girolamo Zoppio (*Ragionamenti in difesa di Dante e del Petrarca*, 1583), Sperone Speroni (*Discorsi sopra Dante*), and Vincenzo Borghini.

Editions of the *Commedia* in the Fourteenth and Fifteenth Centuries

The *editio princeps* of the *Commedia* was printed in Foligno in 1472 by Johan Numeister and Evangelista Angelini. Thirteen further printed editions followed in the fifteenth century, and 36 more in the sixteenth century (Parker, 133–134). These numbers, especially if compared with the 167 editions of Petrarch's *Rerum vulgarium fragmenta* in the sixteenth century alone, testify to Petrarch's position as the dominant vernacular Italian literary model in the Renaissance.

Editions of the *Commedia* (Sources: Parker, 133–134 and http://www.italnet.nd.edu/Dante/text/List_Editions.html)

1472 Foligno, Johann Neumeister ed Evangelista Angelini
 1472 Mantua Georg and Paul Butzbach, with Colombino Veronese
 1472 Venice, Federico de' Conti da Verona
 1477 Venice, Windelin von Speyer, with commentary by Jacopo della Lana, although mis-attributed to Benvenuto da Imola
 1478 Naples, Francesco del Tuppo

1478 Milan, Ludovico and Alberto Piemontesi, with Martino Paolo Nidobeato. With commentary by Jacopo della Lana revised by Guido Terzago
 1481 Florence, Niccolò di Lorenzo della Magna, with commentary by Cristoforo Landino and illustrations by Sandro Botticelli
 1484 Venice, Ottaviano Scoto
 1487 Brescia, Bonino de' Bonini
 1491 Venice, Pietro di Piasi, edited by Pietro da Figine, with Landino's commentary, first fully illustrated edition (images by Bernardino Benali and Matteo Capcasa, or "Codecà")
 1493 Venice, Bernardino Benali and Matteo Capcasa, or "Codecà" with Landino's commentary
 1497 Venice, Pietro Quarengi with Landino's commentary
 1502 Venice, Aldus Manutius, pocket edition titled *Le terze rime di Dante* edited by Pietro Bembo who set it from Vat. Lat. 3197, in which he had copied the text by Boccaccio in Vat. Lat. 3199. Bembo distances himself from the edition by Cristoforo Landino
 1506 Florence, Giunti, editor Girolamo Benivieni
 1507 Venice, Bartolomeo Zani with Landino's commentary
 1512–20 Venice, Bernardo Stagnino with Landino's commentary
 1515 Venice, Aldus Manutius and Andrea Torresani
 1515 Venice, Gregorio de' Gregoriis da Forlì
 1515–33 Venice, Paganino and Alessandro Paganini
 1529 Venice, Jacob Burgofranco or "Pocatela" with Luc'Antonio Giunti with Landino's commentary
 1536 Venice, Bernardino Stagnino, underwritten by Giovanni Giolito with Landino's commentary
 1544 Venice, Francesco Marcolini, with commentary by Alessandro Vellutello
 1545 Venice, Al segno della speranza
 1547 Lyon, Jean de Tournes
 1551 Lyon, Guillaume Roville
 1554 Venice, Giovan Antonio Morando

- 1555 Venice, Gabriel Giolito de' Ferrari, edited by Lodovico Dolce: *Divina Commedia*
- 1564 Venice, Giovanni Battista and Melchiorre Sessa, edited by Francesco Sansovino with commentaries by Landino and Vellutello
- 1568 Venice, Pietro da Fino, with commentary by Bernardino Daniello
- 1569 Venice, Domenico Farri
- 1571 Lyon, Guillaume Roville
- 1572 Venice, Domenico Farri
- 1572 Florence, Bartolomeo Semartelli with commentary on the *Inferno* by Vincenzo Buonanni.
- 1575 Lyon, Guillaume Roville
- 1575 Venice, Domenico Farri
- 1578 Venice, Giovanni Battista and Melchiorre Sessa, edited by Francesco Rampazetto with commentaries by Landino and Vellutello
- 1595 Florence, Domenico Manzani, Accademia della Crusca.
- 1595, Florence, Domenico Manzani, edited by Giambattista Deti sponsored by Accademia della Crusca, with illustrations by Antonio Manetti of the geography of Hell.
- 1596 Venice, Giovanni Battista and Bernardo Sessa, with Domenico Nicolini and with Landino's and Vellutello's commentaries.
- 1613 Vicenza, Francesco Leni
- 1629 Padua, Donato Pasquardi
- 1629 Venice, Niccolò Misserini
- 1716 Naples, Francesco Laino

After the 1595 edition of the Accademia della Crusca, Dante's works nearly fell into oblivion, perhaps because the *Divine Comedy* was placed on the *Index of Forbidden Books* in 1614; or, as Barbi would have it (76), as a consequence of the negative judgments of Castravilla and Bulgarini.

Commentaries on Dante's *Commedia*

Commentaries on the *Divine Comedy* began with the 1322 tercet by tercet explanation of the *Inferno* by Jacopo Alighieri, son of Dante. Many more followed in the fourteenth century, including those by Jacopo della Lana (Italian, 1324–1328), Ottimo (Italian, 1333–1338), Pietro Alighieri (Latin, 1340–1464), Benvenuto da Imola (Latin,

1375–1380), and Francesco da Buti (Italian, 1385).

During the early fifteenth century, readers of the *Divine Comedy* showed a growing appreciation for its moral and poetic aspects, as testified by Giovanni Bertoldi of Serravalle's Latin translation and commentary, requested by an international audience of scholars and theologians during the Council of Constance in 1416. Serravalle shows a preference for the eloquence of Petrarch, but credits Dante with greater doctrine (*Par.* 1.34–36), following in the wake of the humanist critique of Dante's choice of Italian, a seemingly unfit tool for the lofty subject of *Paradiso*. After Serravalle, Guiniforte Barzizza wrote a commentary in Italian on the *Inferno* (1438–1440), after which there was then no new commentary produced until those of Martino Paolo Nidobeato in 1478 and Cristoforo Landino in 1481.

The 1481 edition of the *Divine Comedy* with Landino's commentary marked a turning point in the reception of the poem. Not only was this edition the first printed in Florence (following Nidobeato's 1478 printing of Jacopo della Lana's commentary in Milan, Florence was obliged to respond), it was also accompanied by engravings by Baccio Baldini after Sandro Botticelli's drawings and introduced by Landino's long defense of "Dante and Florence" against their opponents (*Apologia nella quale si difende Dante et Florentia da falsi calunniatori*), thus marrying the literary fortune of the poet to the political agenda of the city. Landino's work, the first integral commentary in the Italian vernacular, was strongly marked by the cultural idiom of Medicean Florence: neo-Platonism (Caesar, 281).

Beginning in the 1540s, Dante commentaries took a new direction: the aesthetic and linguistic interest of the Bembo school was replaced by moralistic preoccupations, a taste for theory and erudition, that brought a narrower critical scope and an attention to the religious value of the Dantean poem (Bigi 1981b). The Lucchese Alessandro Vellutello (Lucca 1473?–Venice 1576) published his commentary on Dante's *Commedia* (*La Comedia di Dante Alighieri con*

la nova esposizione di Alessandro Vellutello, Venice: Marcolini, 1544) dedicated to pope Paul III with a set of 87 engravings by Giovanni Britto. While vehemently polemical with regard to Bembo's Petrarchism, and accusing Bembo of having provided printer Aldus Manutius with highly incorrect texts for the editions of Dante and Petrarch, Vellutello was also hostile to Florentine political ideals, admiring Dante as a rebel to his own city and a free spirit. Vellutello states in his introduction, "Ai lettori," that he had received information and documents from a descendant of Dante himself, and thanks to this new material his commentary would be able to explain the text more faithfully on literal, historical, and geographical levels. Vellutello's commentary was reprinted in 1551 (Lyon: Roville), 1564 and 1578 (Venice: Sessa, both of these with Landino's commentary).

Although Trifone Gabriele never published his *Annotazioni a Dante* (1525–1541), a set of learned notes on the stylistic, allegorical, moral, and theological aspects of the *Divine Comedy*, the "Venetian Socrates" (as he nicknamed himself for his predilection for informal teaching) left a mark that, departing from Landino's Platonic tradition and line by line paraphrase, corrected many interpretations and offered original insights especially regarding Dante's language and style (Parker, 89).

The only other complete commentary in the sixteenth century was that of Bernardino Daniello (1568), but critics have often expressed skepticism about its originality because of its indebtedness to Daniello's teacher Trifone Gabriele. If Daniello follows very closely his teacher's anti-Landinian spirit, to the point that they were both taunted for alleged Protestantism, he also explains stylistic and rhetorical devices with painstaking care (Parker, 121).

Lodovico Castelvetro (Modena, 1505 – Chiavenna, 1571) wrote marginal notes in an incunabulum of the *Commedia* containing Landino's commentary (Modena, Bibl. Estense, Alpha K. 1. 13, printed in Venice: Piero de Quarenghi, 1497) and a commentary to the first 29 cantos of the *Inferno* (*Sposizione a XXIX canti dell'Inferno dantesco*), probably completed in 1569–1570 but first published only in 1886

(Franciosi, Modena). Castelvetro sees contradictions and vulgar expressions in Dante's language, especially in the section of Malebolge, and accuses the divine poet of lacking in consistency, logic, and verisimilitude. Despite this stern criticism, Castelvetro argued against Bembo in favor of Dante's poetry, placing it above all others and comparing Dante's superiority over Petrarch to Homer's superiority over Virgil (*Sposizione*, 91). Suspected of Lutheranism, Castelvetro was accused of the murder of Alberico Longo, a friend of Annibal Caro, and forced to flee Venice in 1556. Allegations of Lutheran heresy may also have originated from his reassessment of the heretical Pope Anastasius as a follower of Photinus in *Inferno* XI (Dalmas, 248). Here we should note that Bembo's preference for Petrarch's balanced style did not mean that he excluded Dante from the canon, as is proven by his Aldine edition of the *Commedia* (Venice, 1502).

After Castelvetro's incomplete commentary, no other was produced until the 1732 work by Pompeo Venturi.

Davenant, William

Born: 1606

Died: 1668

Ronald Levao

Department of English, Rutgers University, New Brunswick, NJ, USA

Abstract

Davenant's philosophical interest is explicit and implicit in his work. Disraeli's romantic praise of him as "a poet and and a wit... and at all times a philosopher" (Disraeli 1859, p. 404) signals the two-sided appreciation that has been extended and complicated by later

intellectual historians and critics. Primarily a literary figure, Davenant helped theorize the emergence of a logically clarified, empirically chastened neoclassicism in opposition to what his friend Thomas Hobbes called the "ambitious obscurity" of late Renaissance aesthetics. Active during an era of political upheaval, Davenant emphasized rationalized order and conservative, royalist loyalties; nonetheless, recent scrutiny has been devoted to the contradictions and ambivalences within his explicit themes and methods.

Biography

William Davenant (D'Avenant, D'avenant) spanned three major phases early-modern England – the late Renaissance, the Puritan Commonwealth, and the early Restoration – distinguishing himself as a poet and playwright as well as an active figure in military and political affairs. Part of his historical reputation is the legend, which he apparently encouraged, that he was not only Shakespeare's godson but also his illegitimate son and, spiritually, his literary heir. A successful writer of comedies and tragedies for Shakespeare's old company, the King's Men, and of court masques (elaborate spectacles including music and dance), he was appointed England's poet laureate in 1638. Living in French exile during the early years of the Puritan Commonwealth (later termed the Interregnum), he wrote his most influential philosophical work, a *Preface* to his quasi-epic *Gondibert*. Publishing it in 1650 along with Thomas Hobbes' sympathetic *Answer*, he continued to work on the poem itself after being captured at sea later that year and imprisoned in England, awaiting possible execution. Pardoned in 1654, he produced informal "entertainments" as well as England's first opera despite the Puritan closing of the theaters. His career blossomed during the Restoration of the monarchy, which also revived English drama; he became a transformative theatrical manager, adapting several major Shakespearean plays for new tastes and pioneering the use of moveable scenery and female actors.

Heritage and Rupture with Tradition

Davenant's early works affirm virtuous reconciliation and mutual love in reaction to an anxiety about an impending collapse of order – a dramatic and productive tension articulated by generations of Renaissance thinkers and literary forebears such as Spenser, Donne, Shakespeare, and Milton (Haydn 1950, *passim*; Greenblatt 1980, *passim*; Bouwsma 1990, pp. 157–189). Davenant's attitudes were also complicated across his lengthy career by a skepticism about the puritanical zeal or improbable idealizations that his contemporaries variously posited as remedies for an unsettled culture (Sharpe 1987, ch. 2 *passim*). In Davenant's pre-revolution court masque, *Salmacida Spolia*, part of a genre that allegorized broad harmonies triumphing over discord, recent critics have discerned strains of hostility, obsession, and coercion lurking behind high-minded political theory and idealized civility (Wilcher 2001, pp. 33–35; Sanchez 2011, pp. 168–175). His late works, too, show complex engagement with the problematics of order. Readers used to dismiss his revisions of Shakespeare for the Restoration stage as reductive mutilations or ill-considered elaborations, but fresh attention has probed the self-consciousness of their aesthetic, political, and epistemological projects. One study sees Davenant's *Macbeth*, despite its added spectacle and music, reworking the darkly mysterious character of the original through a rational and empirically minded causal structure (Kroll 1990, *passim*). Yet another study finds in the same play a rehearsal of anti-foundational political theory, celebrating yet also skeptical of transcendent claims for authority (Miller 2008, *passim*).

The polarized world of the Civil War and the Interregnum serve as the background to Davenant's best known work, the uncompleted, narrative epic *Gondibert*, including its prefatory material, written in French exile and English prisons. An eclectic, professedly “heroick” poem that interweaves a projected five-part dramatic structure with lyric, epic, and romantic elements, *Gondibert* was contested as to its literary quality in its own day and is rarely defended on such

terms today. Even so, it draws respect as a “philosophical poem,” related to earlier Renaissance works such as Sir John Davies' *Nosce Teipsum* (Gladish 1971, pp. x–xvi) and Fulke Greville's *A Treatie of Humane Learning* (Davenant had begun his career under Greville's patronage). Echoes of Bacon, Hobbes, Harvey, and others sound throughout, and in the reluctant hero's retreat to the House of Astragon, an institute of contemplative study and research ruled over by a wise man, many readers espy the template of “Salomon's House” in Francis Bacon's philosophical-scientific utopia, *The New Atlantis* (1627). “This was a poem to delight a philosopher,” writes Disraeli (Disraeli 1859, p. 408). Of greater interest is *The Author's Preface to his Much Honor'd Friend, M. Hobbes*, published in 1650, in advance of the poem itself, together with the philosopher's concise, generally sympathetic *Answer of Mr. Hobbes to Sir Will. D'Avenant's Preface Before Gondibert*. The independent life of these two documents is an ironic outcome for an author so ambitious of literary fame.

Though some regard Davenant's aesthetic ideas as “pretexts” for political concerns (Zwicker 1993, p. 26), the *Preface* retains its philosophical importance as a “manifesto of neo-classicism,” channeling and combining continental and native theory to chasten the mannerist, metaphysical, and baroque tendencies of Elizabethan and Jacobean poetics (Harbage 1935, p. 197). At once traditional and innovative (Gladish 1971, p. 18), it values classical epic – above all Homer and Virgil – but also aligns itself with Moderns over Ancients, presenting the latter's supernatural machinery and other improbabilities, especially when aped by Moderns, as errors of a dreamlike imagination. For Davenant, the moral function of literature, long a humanist concern, requires a balance of restraint and freedom of the probable and intriguing strangeness.

These caveats prepare for Davenant's location of poetic Wit at the confluence of painstaking labor, “lucky resultances,” and “dexterity of thought.” Wit is essential to “full comprehension,” in distinction to facile cleverness, ostentatious conceits, or the pretense to “inspiration,” which he calls “a dangerous word... a spiritual

Fitt" (Gladish 1971, pp. 18–22). Supernatural mystification recalls claims to prophetic power, which "pretend authority over the people." The usefulness of poetry, rather, lies in persuading readers to moderation, civility, and knowledgeable obedience – an aesthetic solution to political chaos that Davenant championed, despite the mockery of contemporary satirists for his apparent self-importance.

There do remain, however, troublesome paradoxes in Davenant's version of poetic persuasion. Renaissance didactic theory often promises to reach a broad audience, but Davenant's poetry of "Courts and Camps," with "patterns fit to be imitated," aims only at the elite, "the most necessary Men," with the "common Crowd" tamed by legal precept and punishment or, more optimistically, by imitating the rules embodied in their leaders' imitations (Gladish 1971, p. 13). Epistemological shifts are likewise tricky in their search for scrupulous balance. We must, Davenant stresses, eschew fantastical indulgence for the sake of probability, but we must also be wary of the "bond to truth" that plagues "austere Historians": "Truth narrative, and past, is the Idoll of Historians, (who worship a dead thing) and truth operative, and by effects continually alive, is the Mistress of Poets, who hath not her existence in matter, but in reason" (Gladish 1971, pp. 10–11). Grafting Philip Sidney's enthusiasm for poetic fictions onto Bacon's sharp-eyed, empiricist critique of Idols, Davenant seeks to whet the rational appetite, "bringing Truth (too often absent) home to mens bosoms," enlivened "in an unusuall dresse" (Gladish 1971, p. 20). But this project also reflects a complex insight into the psychology of didacticism, acknowledging the imaginative power needed to rouse the virtuous, who often have "too little appetite for greatness" to match the ambition of the vicious (Gladish 1971, p. 13). A similar riskiness appears in his treatment of the affections in poetry and politics: to raise and direct passions for the sake of renewing civic virtues may pander as well as instruct, enabling vicious as well as virtuous ends (Kahn 2004, pp. 143–145; Chua 2014, *passim*).

The relation of Hobbes's *Answer* to Davenant's *Preface* has been read variously: as complement, adjustment, or firmer and more concise rationalization. Like Davenant, Hobbes attacks unregulated imagination and the pretenses of inspiration on political and epistemological grounds. The vain-glory of poetic fantasy, which Hobbes had compared more than a decade earlier to the delusions of Don Quixote, may well impel seditious violence (Kahn 2004, pp. 142–145). Hobbes now compares affectations of prophetic power to farcical or incompetent conjurers summoning ungovernable spirits or storms. Instead of truth and "Reformation," discord and tumult may be the consequence of a "man enabled to speake wisely from the principles of nature and his own meditation" yet preferring "to be thought to speake by inspiration, like a bagpipe" (Gladish 1971, pp. 48–49). True knowledge, Hobbes contends, is scrupulous and self-aware. It submits experience of Nature to memory (fabled mother of the muses), thence to her twin offspring, judgment, and fancy, which, if guided by true Philosophy, produce all that separates civility from barbarity. As in politics and philosophy, so in literature, the "limit of Poetic Liberty" constrains the "exorbitancy" of "strange fictions" to a proper resemblance of truth in a world of matter and motion. And though Hobbes's emphasis alters in other works depending on context, he insists that even the most delightful poetic fancy must play the role of philosopher as well as poet, "to furnish and square her matter" (Gladish 1971, pp. 50–51).

Impact and Legacy

While Davenant's legacy is more conspicuous for the theater than for philosophy, it has resonance for speculation as well. His *Preface*, together with Hobbes's *Answer*, has shared in the disapproval sometimes leveled at the new "rationalistic spirit" for its "stringent classicism," its "confinement of the imagination," and worse: "Something had gone out of life... In Davenant and Hobbes the fire is gone" (Spingarn [1899] 1963, p. 164; Hall 1963, p. 56.). But restraint in one direction opens

range and dexterity in another, one sign of which is the tone each takes in addressing the other. For both writers, philosophizing allows “perspicuity, property, and decency” to excite the mind to “curiosity, which is a delightfull appetite of knowledge” (Gladish 1971, p. 52). Hobbes ends his *Answer* with a double act of wit as Davenant had defined it. First he reproaches his companion seriocomically for his careless repetition of the cliché that age is a second childhood. Endless curiosity and openness to the future fends off mental decline, he reminds his much younger friend. The friendly jab is followed by an ingenious compliment to the notoriously disfigured Davenant, whose nose had collapsed years earlier because of mercury “treatments” for syphilis. In a “far-fetched” similitude, allowable because apt and comely (Gladish 1971, p. 53), Hobbes imagines the characters of *Gondibert* with their multiple virtues as fragments of their author, all reassembled in the mind’s eye of the reader into his perfect portrait, as if composed in the tube of a multifaceted perspective glass (Gladish 1971, p. 55).

Abstract

An important philosopher and theologian in the late fifteenth century Shīrāz, al-Dawānī's teaching and commentaries were formative for subsequent philosophical development in the Ottoman Empire, the Ṣafavid Iran and the Muslim India.

Full Name

Muḥammad ibn As'ad Jālāl al-Dīn al-Dawānī
al-Kāzīrūnī al-Ṣiddīqī

Biography

Born around 1426 in Dawān, a village near the city of Kāzīrūn southwest of the Iranian plateau, Jālāl al-Dīn al-Dawānī first studied *hadīth*, jurisprudence, Qur'ānic exegesis, and the rational sciences in his hometown with his father Sa'd al-Dīn As'ad and a certain Maḥzar al-Dīn Muḥammad al-Murshidī al-Kāzīrūnī, both of whom prided themselves in belonging to a lineage of disciples that could be traced through al-Sayyid al-Sharīf al-Jurjānī all the way back to Avicenna. During his early education, al-Dawānī was also initiated to the Murshidiya *silsila* of Sufis. Later on, he continued his studies in Shīrāz where he subsequently rose to prominence as one of the leading scholars and jurists of his time, holding some of the most prominent religious appointments. Despite the uneasy political conditions of the fifteenth century, al-Dawānī managed to stay in intimate

terms with a number of rulers of his time from the Qaraqunly, Aqqunly, Timurid, and Ottoman dynasties (dedicating three works to sultan Bāyazīd II) and also enjoyed the patronage of certain Indian political authorities (notably sultan Maḥmūd I of Gujarat to whom he dedicated several works, among them the *Unmūdḥaj al-'ulūm*, a kind of encyclopedia that covers questions in a wide range of both Islamic and rational sciences). This, however, did not prevent his sizable property from being confiscated during an uproar in 1498–1499, subsequent to which al-Dawānī left Shīrāz, according to some sources in order to migrate to India where two of his students had established some fame. Originally a staunch supporter of Sunnism, the reports about al-Dawānī's attitude to the emerging Shī'ite cause of the Ṣafavid *shāh* Ismā'il are conflicting. However, having passed away in 1502, he did not live to witness Ismā'il's final conquest of Fārs.

Although al-Dawānī was active in a number of fields of the sciences, he made his most important contributions in philosophy and theology. A highly venerated teacher, he is known to have lectured widely on works belonging to different schools of philosophy and theology, including the Avicennian Peripatetic tradition (the *Kitāb al-ishārāt wa al-tanbīhāt* with Naṣīr al-Dīn al-Ṭūsī's and Qutb al-Dīn al-Rāzī's commentaries), the *ishrāqī* tradition founded by Shihāb al-Dīn al-Suhrawardī (most notably the eponymous *Ḥikma al-ishrāq*) to which he seems to have been particularly affiliated, the mature fourteenth century Ash'arite theology (exemplified by al-Jurjānī's commentary on 'Aḥud al-Dīn al-Ījī's *Kitāb al-mawāqif*), as well as al-Ṭūsī's philosophically oriented Shī'ite theology (the *Tajrīd al-i'tiqād*). A prolific writer from early on, he composed several theological commentaries and supercommentaries on works such as 'Abdallāh ibn 'Umar al-Bayḍāwī's *Ṭawālī al-anwār*, Sa'd al-Dīn al-Taftāzānī's *Tahdhīb al-manṭiq wa al-kalām*, and 'Alī al-Qūshjī's commentary to al-Ṭūsī's *Tajrīd al-i'tiqād*, al-Ījī's creed, and al-Jurjānī's commentary on his *Mawāqif*. His philosophical treatises and commentaries, such as the *Shawākil al-ḥūr* on

Suhrawardī's *Hayākil al-nūr*, signal a thorough familiarity with the *ishrāqī* and the Avicennian commentary traditions. He also wrote on various Sufi topics, for example in the work titled *al-Zawra'* which shows a decisive influence from the school of Ibn 'Arabī. Arguably his best known work is the Persian *Lawāmi 'al-ishrāq fī makārim al-akhlāq*, also known as *Akhlāq-i jalālī*, a primer on practical ethics, economics, and politics modeled on al-Ṭūsī's *Akhlāq-i nāṣirī*.

Heritage and Rupture with the Tradition

In his practical philosophy, as witnessed by the *Akhlāq-i jalālī*, al-Dawānī comes across as a relatively unoriginal thinker who seems satisfied with rerendering al-Ṭūsī's treatise, derived in turn from earlier works by al-Miskawayh and al-Fārābī as well as the Persian "mirror for princes" tradition, in a terminology more consonant with Islamic revelation. Interesting examples of this tendency are his interpretation of the Aristotelian doctrine of the mean in terms of the Qur'ānic idea of moderation and his consistent use of the loaded Islamic term *sharī'a* in the general discussion of the institutional basis of the just society. He also differs from al-Ṭūsī by adopting a decided *ishrāqī* approach in place of the latter's relatively mainstream Avicennism. Despite the relative unoriginality, al-Dawānī's rewriting of the Ṭūsīan treatise seems to have had an important role in the consolidation of the philosophers' ethical and political ideas (such as the hierarchical classification of different types of societies, the isomorphic relation between types of society and types of personality, and the classification of different groups of citizens according to their natural tendencies) as parts of mainstream Islamic thought, especially in the Ottoman and Mughal empires.

Al-Dawānī's philosophical career was strongly marked by a sustained, and occasionally heated, written and oral debate with another Shīrāzī philosopher, Ṣadr al-Dīn al-Dashtakī. This exchange, which was later carried on by Dashtakī's son

Ghiyāth al-Dīn, would determine the philosophical scene in Shīrāz, and Iran in general, for decades or even centuries to come as people would define their own positions in philosophy by taking sides in the debate or by further developing ideas first spawned in it. Apart from public debate, the discussion mainly took shape in the form of layered superglosses on selected theological and philosophical texts, including al-Qūshjī's commentary on al-Ṭūsī's *Tajrīd al-i'tiqād*, al-Jurjānī's glosses on works by 'Aḍud al-Dīn al-Ījī and Qutb al-Dīn al-Rāzī, and Suhrawardī's *Hayākil al-nūr*, but both participants also composed brief treatises on strictly determined philosophical questions.

One particularly heated topic of debate was the correct solution to the logical problem of the liar paradox, a question tackled by most of the major figures in later Islamic theology. Al-Dawānī's solution was to deny that the utterance "whatever I say at this moment is a lie" constitutes a genuine statement. In order to be a proper statement ascribable with a truth value, he stipulated that a sentence must have a semantic relation of reference to the external world – a condition which the convoluted self-referential sentence at the heart of the liar paradox fails to satisfy.

Another debate revolved around the metaphysical question of the relation between God as absolute existence and the created things as determined existents; here al-Dawānī held to a strict distinction according to which God alone is existence in an absolute sense of the word while all other things are merely existents, that is, essences that *have* existence as an accidental relation to something other than themselves. Interestingly, al-Dawānī introduces his position as having been instigated by the *ishrāqī* commentator Ibn Kammūna's famous "sophistical" argument for the possibility of two necessary existents; holding that the argument hinges on conceiving of God as an existent, al-Dawānī's conclusion was to deny the validity of attributing this term to Him. Another interesting feature of this debate is that in formulating his case, al-Dawānī liberally employs concepts and ideas derived not only from the traditions of philosophy and theology

but also from the Sufi tradition of Ibn ‘Arabī and his disciples.

Al-Dawānī’s critical remarks concerning the Avicennian idea of mental existence also gave rise to a dispute. According to him, mental existence violates the idea of formal identity, crucial to Avicenna’s Aristotelian epistemology. This is because if we suppose that objects of knowledge exist mentally as accidents in the soul, we will have no way of accounting for an adequate knowledge of substances, for no formal identity can be established between objects falling in two different categories – the extramental form of the substance to the category of substance and the corresponding mentally existing and therefore accidental form to the category of quality. A fourth major point of content concerned the question of God’s knowledge of particular things and a fifth the question of the separability of the human soul from its body; in the latter case, al-Dawānī subscribed to mainstream Avicennian substance dualism.

Impact and Legacy

The debate between al-Dawānī and the elder Dashtakī on questions like the relation between essence and existence, or the question of mental existence, can clearly be seen to determine the positions of such major philosophers of the Ṣafavid era as Mīr Dāmād or Mullā Ṣadrā. In al-Dawānī’s case, the influence took place mainly through his presence in the minutes of the debate, which was recorded in various layers of glosses on the works listed above. He did have a number of students who were instrumental in carrying on his influence although no school adamantly defending his position, comparable to that initiated by al-Dashtakī’s son, seems to have emerged. Yet some of al-Dawānī’s students, such as Jālāl al-Dīn al-Astarābādī, rose to prominent religious positions and were capable of influencing the cultural policies of the new rulers. Another chapter in al-Dawānī’s posthumous influence would have to be situated in India and the Ottoman empire, where he wielded a major influence through his students such as Muẓaffar al-Dīn

‘Alī al-Shīrāzī and Mu’ayyadzāde ‘Abd al-Raḥmān Efendī.

De Balmes, Abraham ben Meir

Born: Around 1460, Lecce

Died: 1523, Padua or Venice

Silvia Di Donato

SPHERE (UMR 7219), CNRS, Paris, France

Abstract

Abraham ben Meir de Balmes, born in Lecce, in Southern Italy, and active in Padua and Venice, belonged to a group of Jewish thinkers who participated in the Renaissance movement of translation of medieval Arabic philosophical and scientific works. In addition to his translation activity, he is particularly known for his Hebrew-Latin grammar, *Miqneh Avram* (*The Flock of Abram*; *Gen. 13:7*).

Biography

Abraham ben Meir De Balmes was a Jewish physician, grammarian, philosopher, and translator. His family probably hailed from Spain and moved to Southern Italy around the middle of the fifteenth century; it obtained numerous privileges thanks to Abraham ben Meir's grandfather (c. 1420–1489, Abraham De Balmes the Elder) who was a prominent physician at the court of King Ferdinand I of Naples. De Balmes' education combined traditional rabbinic wisdom and philosophy and science, in the Averroistic and

Maimonidean form that Aristotelian philosophy took in the Jewish Middle-Ages. He studied medicine in Naples and he obtained, in July 1492, the title of *artium et medicinae magister* under permission of Pope Innocent VIII (d. 1492). He obtained the title of *artium et medicinae doctor* too (the document is exceptionally extant, Zürich, Braginsky Collection, BCB 371), a title that appears in the headings of his manuscript translations and in the frontispiece of his grammar *Miqneh Avram* (*The Flock of Abram*). This latter work is the source of an additional detail about De Balmes philosophical learning, as the author himself names in several places the rabbi, physician, logician, and Aristotelian philosopher Judah ben Yehiel Messer Leon (~ 1425–1498) as one of his teachers, in Naples.

Probably because of the expulsion of the Jews from the kingdom of Naples in November 1510, De Balmes emigrated to the Venetian territories. He participated in the animated philosophical debate around the humanistic center resented by the university of Padua, where he possibly delivered philosophical lectures. He was one of the most remarkable figures of Italian Jews involved in the wave of translation – from Hebrew into Latin – of the philosophical and scientific medieval Arabic heritage that began around 1480 in the framework of the Renaissance interest in the Aristotelian tradition and Aristotle commentators. Other illustrious figures have been Elia del Medigo, Calonymos ben Calonymos, and Iacopo Mantino.

De Balmes was one of the most prolific Jewish translators of this period, under the erudite patronage of Alberto Pio di Carpi (1475–1531) and of Cardinal Domenico Grimani (1461–1523) of Venice, qualified by his contemporaries as one of the most eminent and influential scholar of his time, who De Balmes served as personal physician. He accomplished about thirty Hebrew-Latin translations of philosophical and scientific works, notably of Averroes Commentaries (Ibn Rushd 1126–1198). His versions of almost all Commentaries on Logic reflected his strong interest in that field; these translations of Averroes works have been incorporated in various Venetian editions (with the only exception of the *Quaesita naturalia*

that are extant in manuscript): The first edition of De Balmes translations of Averroes Commentaries on Logic was published in 1523 (Gian Antonio da Sabio); his versions were then published in the Aristotle-Averroes Giunta editions of 1550–1552, 1560–1562 and 1574, and by Nicolò Boscarini in 1552.

The Latin translations of other works of Averroes and of other Arab philosophers certainly met the interests of De Balmes, protector – in physics and in the nature of the human soul, and they were relevant original sources of the animated philosophical debate Cardinal Grimani was involved in, notably at the Paduan School. Among De Balmes translations it figures: Averroes' *Liber modorum rationum* (*Kitāb al-Kashf an Manāhiḡ al-adilla*; *The Book of Exposition of Religious Arguments*), the *Epistola expeditionis* (*Risālat al-wadā*; *Letter of the farewell*) of Ibn Bājja (~1085–1139), and the *Libellus De intellectu et intelligibili* (*Risālah fī 'l-'aql*; *Treatise on the intellect*) of al-Fārābī (870–950). The corpus of his versions is completed by the translation of *De mundo* (*Maqāla fī hay'at al-'ālam*) of Ibn al-Haitham (965–1039) and the *Isagogicon Astrologiae Ptolomei* of Geminus of Rhodes. These translations survive in manuscripts.

De Balmes composed three original works that reveal his doctrinal interests and the role, in his thought, of a distinctive original aspect of Jewish philosophy of the sixteenth century, represented by kabbalah linked to philosophy. His already mentioned Hebrew-Latin grammar (*Miqneh Avram/Peculium Abrae*) was published in Venice in 1523, by Daniel Bomberg. This work occupies a particular place within the Hebrew grammatical and lexicographical tradition, presenting influences of the Latin grammar and of the Aristotelian philosophy. The edition of 1523 included also his *Liber de demonstratione*, a thematically organized compendium of the *Great commentary* of Averroes to the *Book of the Demonstration* (Aristotle's *Posterior Analytics*, as the book was named in the Arabic and Hebrew traditions). The third work, the *Iggeret ha-'asirya* (*Epistle of the Decad*), is a kabbalistic-philosophical text on the

ten *sefirot*; it is extant in a unique manuscript (New York Public Library, ms. Heb. 186, previously in the Montefiore Library of London).

de Bérulle, Pierre

Born: 4 February 1575, Cérilly

Died: 2 October 1639, Paris

Simone Guidi

Sapienza Università di Roma, Rome, Italy

Abstract

A French cardinal, among the main intellectuals of the French Counterreformation and the founder of the Oratoire de France. Bérulle's thought is the fruit of an eclectic meeting between the scholastic tradition, looking back to its father figures (notably Augustin) and neo-Platonist Hermeticism. He is known as "the Apostle of the Word Incarnate" for his doctrine of the Incarnation of Christ.

Biography

A French cardinal, one of the main representatives of the Catholic Counterreformation in France (Dagens 1952), he is the founder of the Oratoire. Born in Cerilly in 1575 and died in Paris in 1629. Schooled by Jesuits in Clermont, he studied at the Sorbonne and was ordained in 1599. His efforts concentrated on leadership of the French Counterreformational front. Two events were fundamental: the introduction of the Carmelite Order of nuns in France (of which he became the Superior in 1604) and the founding of the Jesus Oratoire (in 1611), designed to assist and encourage the clergy in their spiritual advancement. He became a cardinal in 1627 and in 1629 was appointed head of the Queen's Council. In 1628 he had a meeting with René Descartes (Marion 1981; Rodis-Lewsi 1990), whose spiritual guide he is said by some scholars to have become.

Heritage and Rupture with the Tradition

Bérulle is a perfect example of the Counterreformational eclecticism, often of Jesuit character, prevalent in the early seventeenth-century France (Dagens 1952). His fundamentally scholastic doctrinal thought structure embraces and integrates the most varied and wide-ranging influences, including a strong mystical streak. Accordingly he was nicknamed “the Copernicus of Incarnation” or “the Apostle of the Incarnated Word” (as he was described by Pope Urban IV), as his work was centered on a sort of mystical cosmography, quite common at that time, dominated by God's “solar” centrality. His best known doctrine, expressed in a kind of oration that Bérulle calls an “elevation,” is that of the mystical incorporation of Man with Jesus Christ achievable through the work of the Holy Spirit, whose action reproduces the virtues of the Son in those who turn to it. Bérulle's thought is an Augustinian Theory of Man, deeply influenced not only by a thorough knowledge of Hippocrates but also by readings and doctrines in the Platonic and the Hermetic traditions (Rodis-Lewis 1990), which his work contributed to reintroducing into the culture of the

seventeenth-century France. Marsilio Ficino and Giovanni Pico della Mirandola are particularly relevant, but Bérulle was also strongly influenced by Montaigne (Bady 1964).

This syncretic Theory of Man emerging from Platonic-Augustinian thought already shows through in his early *Traité des Energumenes* (Walker 1981), at the beginning of which Bérulle celebrates Man as the center of creation by virtue of his analogical ability to be the reflection and image of the world. It was again from the early sixteenth-century Platonistic Hermeticism that Bérulle took the idea of Man as a composite being, halfway between spirit and matter, the battleground in a struggle between animal drives and moral living, in which Man alone is always driven downwards. While all God's creatures are characterized by a striving towards their Creator, Man has become, through sin, the victim of his pride and unable to turn to his Father (Dagens 1952; Bellemare 1959; Cadoux 2005). But if original sin has taken Man away from God, a connection between the Creator and his creature has nevertheless been restored by the Incarnation, as expressed by the Augustinian saying “Si homo non periisset, Filius hominis non venisset.” The whole point of the Incarnation is thus human redemption and the safeguarding of the perfection of creation. But Christ, by his very nature, is a quite unique figure, able to be at the same time both human and divine, as he was really the Son of God and the Son of Man (Dagens 1952; Bellemare 1959; Cadoux 2005). By the act of restoring the relationship with the Father, he offers Man the opportunity of a real “creation” within creation, the “creation in Christ” referred to by St Paul. The Incarnation is thus the highest and yet at the same time the humblest of mysteries, and the ability of Man to embrace salvation inevitably requires self-denial through the constant repression of his own pride. In the observance of spirituality, however, Bérulle takes a stand in firm opposition to stoicism: virtue, he says, must be pursued because it takes us closer to Christ, not because it is good in itself. Man, in other words, is completely in God's hands, and his only chance is to open up to the discovery of the Creator who lives inside his soul (Dagens 1952).

Gräzistik und Latinistik, Leopold-Franzens-
Universität Innsbruck, Innsbruck, Austria

Abstract

Marc'Antonio De Dominis was a prolific scholar, who composed, among other things, two pioneering scientific treatises, the *Tractatus de radiis visus et lucis in vitris, perspectivis et iride* (1611) and the *Euripus, seu de fluxu et refluxu maris sententia* (published posthumously in 1624). However, his controversial religious and intellectual outlook, which led to a break first with the Catholic Church and later with the Anglican Church, caused his work to be subjected to criticism and consequently neglected.

Alternate Names

[De Dominis](#); [Marco Antonio](#); [Markantun](#)

Biography

Marc'Antonio De Dominis was born on the island of Rab (modern Croatia), to a noble family of Dalmatian origin (Patterson 1978). He studied at the Illyrian College in Loreto, Italy, after which he entered Padua University. De Dominis later taught at several institutions in Italy and in 1579 joined the Society of Jesus. Upon leaving the Jesuits in 1596, he received various ecclesiastical appointments in Dalmatia. De Dominis' career within the Catholic Church culminated in his appointment to the archiepiscopal see of Spalato. However, during the conflict between the Holy See and the

Venetian Republic in 1606–1607, De Dominis leaned toward supporting the latter. Along with the controversial way of governing the Spalato diocese and numerous conflicts with fellow clergymen, this forced him to resign from the position. After the Inquisition started scrutinizing his views, De Dominis, who at the time entered into contact with the English ambassador to Venice, decided to flee to England.

When in England, he composed a number of texts harshly criticizing the Catholic Church. The most ambitious one, the *De republica ecclesiastica contra primatum papae* (De Dominis 1617–1622), was reprinted several times. It allowed De Dominis to establish himself as a fervent opponent to Rome and gain some power at the court of James I. De Dominis did not enjoy the new status for a long time. As testified by numerous accounts, in the end, vanity, avarice, and constant intrigues turned his patrons against him. After his secret correspondence with Rome had been revealed, De Dominis was expelled from England and had to return to Italy. There, the character of his writings turned upside down, which resulted in a series of anti-Anglican sermons, just as harsh as the previous anti-Latin pamphlets. The Church authorities did not buy De Dominis' alleged reconversion, and he was subjected to an inquisitorial trial. Confined to the Castel Sant'Angelo, he died a natural death there before the end of the trial. However, De Dominis' case was continued, with judgment pronounced over his corpse in the Church of Santa Maria sopra Minerva in Rome. Following the order of the inquisitors, De Dominis' body was taken from the coffin, dragged through the streets of Rome, and publicly burned together with his works in Campo dei Fiori.

Innovative and Original Aspects

De Dominis' pamphlets on religious matters are in line with the genre of cross-confessional writings flourished at the time. What makes these texts particularly interesting is the way they reflect De Dominis' floating position and mirror his biography. At the same time, two scientific treatises that put De Dominis at the forefront of contemporary natural philosophical investigations deserve closer

examination. In the *Tractatus de radiis visus et lucis in vitris, perspectivis et iride* (De Dominis 1611), he provides a detailed account of the phenomenon of the rainbow – a topic widely debated in the sixteenth and seventeenth centuries in its connection to the philosophy of light and optics. De Dominis was the first to draw attention to the fact that in each raindrop the light undergoes two refractions and an intermediate reflection. He went on to explain, with the use of optical and scientific arguments, the formation of the interior bow. De Dominis' study, highly praised by Isaac Newton, is now considered to have significantly contributed to Descartes' later description of the rainbow (Scott 1952).

In the second writing, the *Euripus, seu de fluxu et refluxu maris sentential* (De Dominis 1624), relying on a long-standing tradition of natural philosophical discussions on the origin of tides, De Dominis attributes the phenomenon to the effects and positions of the sun and the moon. He claims that the tides are due to the interaction of the luminaries, which exert an effect on the water similar to magnetism, and their action is at its maximum not only where they are at the zenith but also at the antipodal point (Bonelli and Russo 1996). Unlike many of his contemporaries who interpreted the flow and ebb by applying astrological and vitalistic theories, and in contrast to Galileo, who considered tidal motion to be one of the most significant arguments for the heliocentric system (Omodeo 2017), De Dominis made an important step toward the final scientific interpretation later coined in Newton's *Principia Mathematica*.

Impact and Legacy

Despite De Dominis' clear achievements in the fields of natural philosophy and science, they were overshadowed by his controversial personality, mainly in what was concerned with the ecclesiastical legacy. This makes Newton's note on De Dominis' rainbow account the only major recognition of his scholarly efforts. Thus, without naming De Dominis, Galileo firmly dismissed his theory of tides in the *Dialogue*. In the meantime, those scholars, who remained loyal to the Catholic Church, continued to consider De Dominis a *bête noire* after his death. This negative attitude was

summarized in Jesuit Roger Joseph Boscovich's extensive notes on the poem *De Iride* ("On the Rainbow") composed by another Jesuit scholar Carlo Noceti: Boscovich, who was also of Dalmatian origin, refused to acknowledge any intellectual value of De Dominis' *Tractatus*. He claimed that what De Dominis had done in his treatise was so insignificant that any other scholar could have easily come to the same results (Noceti 1747).

Abstract

André de Gouveia was a Portuguese humanist and one of the most outstanding sixteenth-century pedagogues, having occupied distinguished positions in important educational institutions in France and Portugal. A man of singular character and personality, Gouveia's progressive views influenced the educational programs and the *ethos* of these institutions.

Alternate Names

[Gouveanus, Andreas](#); [de Gouvea, Andre](#)

Biography

André de Gouveia (1497 (Beja, Portugal) to 1548 (Coimbra, Portugal)) was born into a family of

humanists: his uncle was Diogo de Gouveia (diplomat, theologian, and principal of the College of Saint-Barbe), and he was brother to António de Gouveia (famous for his polemic with Pierre de la Ramée, defending Aristotelianism, and a teacher in France and Italy) and Marcial de Gouveia (who corresponded with both Erasmus and Melancthon and later became a teacher in Coimbra).

His education was the fruit of royal initiatives to send Portuguese young men to study in Paris with scholarships (Matos 1952): in 1524, Gouveia became one of the first generation of Portuguese to study at the College of Saint-Barbe (Paris), which was under the leadership of his uncle (Pellerin 2009; Serrão 1966, 1967). His intellectual trajectory, however, is intimately linked to the international Republic of Letters, especially in France, and to the Reformation movement which spread across Europe in the first half of the sixteenth century. A master in arts in 1528, he became a doctor in theology in 1530 and was asked by his uncle to direct the College, which he did by opening the institution to more progressive forms of humanist training (Quicherat 1860–1864).

Soon, however, in 1534 Gouveia was invited by the municipal authorities of Bordeaux to become the principal of the local College of Guienne and to reform the institution. Under Gouveia's leadership (1534–1547), the College flourished to become one of the most prestigious educational institutions in Europe (Dezeimeris 1970; Gaullieur 1874) – rivaling with the College of Saint-Barbe in Paris – and one of the most progressive: the democratic running of the school, the religious tolerance promoted by the College (no religious differences were to be recognized among tutors and pupils until 1535), and the quality of the teaching staff (including Budin, Mathurin Cordier, Nicholas de Grouchy, and George Buchanan) and of the program of study (recorded by Élie Vinet in his *Schola Aquitanica*, 1583 – Vinet 1886, 1944) made it *alma mater* to some of the most influential intellectuals of the time, like Montaigne, Etienne de la Boetie, and Joseph Justus Scaliger (Woodward 1965). It was

while at the College of Guienne that the rumors about Gouveia's Protestant sympathies began to gain consistency (Bataillon 1952, pp. 121–129; Gorris Camos 2001).

Between 1546 and 1547, Gouveia traveled continuously between France and Portugal, as he was asked by King John III to launch a newly founded Colégio das Artes in Coimbra (Brandão 1933). This royal institution was designed along the same lines as the Trilingual College of Louvain instituted by Busleyden and was intended to provide the country's youth with a solid humanistic training (Silva Dias 1969; Saraiva 1955). The Colégio opened in 1547, with a cosmopolitan group of eminent scholars: George and Patrick Buchanan, Nicolas de Grouchy, Élie Vinet, Arnould Fabrice, Guillaume Guérente, Diogo de Teive, and João da Costa. The Colégio provided teaching in the areas of grammar, rhetoric and poetics (Pinto de Castro 1984), Latin, Greek and Hebrew, theology, as well as logic, philosophy, and mathematics, its program being very similar to that in place at the College of Guienne in many ways (see Vinet 1944 and Anon 1944). The Colégio was home to the intellectuals mentioned above but also to the mathematician and cosmographer Pedro Nunes and an important tradition of commentary to Aristotle by Jesuit scholars developed there between 1592 and 1606.

This was, however, after Gouveia's death in 1548. In 1555 the Colégio was handed over to the Society of Jesus: motivated by envy and orthodoxy, Gouveia's uncle complained to the King that André had Lutheran sympathies and denounced some of the staff (Buchanan, Teive, and da Costa) to the Portuguese Inquisition as Protestant (Brandão 1948–1969). This rivalry between the Bordeaux staff members and the more traditional Parisian teachers eventually caused damage to the institution, and the Colégio became the battleground for the dispute between a more orthodox group of Parisian intellectuals and the more progressive Bordeaux group (Silva Dias 1960): the three humanists were convicted, and in 1555 the Society of Jesus took over the Colégio das Artes founded by André de Gouveia (Brandão 1948–1969).

de Gouveia, Antonio

Born: 1510

Died: 1566

Catarina Fouto

Department of Spanish, Portuguese and Latin American Studies, King's College London, London, UK

Abstract

António de Gouveia (1505–1566?) was a Portuguese humanist. Gouveia developed a multifaceted career as philologist, jurist, and Neo-Latin poet but is best-known for his polemic with Pierre de la Ramée on Aristotle.

Alternate Names

[Gouvêa, Antoine](#); [de Gouvea, Antonio](#); [Goueanus, Antonius](#); [Gouvea, Antonius](#)

Biography

Born in Beja, Portugal c. 1510, António de Gouveia studied in Paris, at the Collège de Saint-Barbe (1527–34), where he became a Master of Arts in 1532. He moved to Bordeaux (1535–37), most likely thanks to the invitation of his brother, André de Gouveia, who was the principal of the Collège de la Guyenne. From this time dates his friendship with the humanists George Buchanan, Diogo de Teive, Nicolas de Grouchy, and Guillaume de Guérente. After brief stays in Toulouse and Avignon, Gouveia remained for 2 years in Lyon, working at Sebastian Gryphius' printing house as a proofreader from 1539 to 1541. It was Gryphius who published his *Epigrammatoi libri duo ad mortalitatem* (1539, 1992), his *Epigrammata. Epistolae quatuor* (1540), his translation and commentary of Porphyrius, *Introductio ad Chrysaorium* (1541), and his edition of Virgil and Terence, *Virgilius et Terentius pristino splendori restituti* (1541). His close friendship with the jurist Emilio Ferreti dates from his Lyon years.

Gouveia returned to Paris, to the Collège de Saint-Barbe, where he taught arts and philosophy (1542), and where he published a slim volume entitled *Alphabetum Graecum* (1542), an edition and commentary of Cicero's *In Vatinius* (1542), *Ad Atticum* (1544), and *Topica* (1545). Increasingly interested in philosophy, he became involved in polemic with Pierre de la Ramée, then a young master of the Collège de Navarre, who voiced a strong reaction against Aristotle's undisputed primacy in the medieval university curriculum (see Ong 1958). In 1543, Gouveia published a slim book entitled *De Conclusionibus commentarius* (see Serrão 1966) in which he defends Aristotle's *Organon* against the attack launched by Pierre de la Ramée, who later that year published two volumes setting out his own objections to Aristotle in *Dialecticae institutiones* and *Aristotelicae animaduersiones* (both in 1543). Gouveia's lengthy response to Ramée, *pro Aristotele responsio aduersus Petri Rami calumnias*, appeared just 2 months later also in

1543. The book was warmly received by the university, and Gouveia was appointed to debate with la Ramée in 1544 for 3 days, by order of François I, before a jury made up of five members and presided by Jean de Salignac, theologian appointed by the King. Gouveia was held victorious and the sale of de la Ramée's books was forbidden and his lectures interdicted.

Gouveia left Paris, very likely due to the breaking down of relations with his uncle, the orthodox Portuguese humanist Diogo de Gouveia (c. 1471–1557). After a brief period in Toulouse, Gouveia settled down in Bordeaux at the Collège de la Guyenne, where he studied Law and began publishing books on this subject matter. It was, however, in Toulouse that Gouveia concluded his doctorate in Law towards the end of 1548 or the beginning of 1549 and he married Catherine Dufour, daughter of the local Toulouse Parliament in 1549. This period corresponds to a new phase in his career, Gouveia publishing a flurry of books on law (1545, 1551, 1554): these include a commentary on Cicero's *De legibus* (1552), and in Toulouse he published books on pupillary substitution (1554) and the Falcidian law (1556), among others.

Having settled in Cahors as a professor of Law for 5 years, Gouveia then moved to Valence also to teach at the university where he stayed only for 1 year: in 1555 he began teaching at the University of Grenoble, which he left only in 1562 when classes were suspended due to religious conflict – his last published work dates from this period: his *Opera juris civilis* appeared in Lyon in 1562. He was invited to teach at the University of Mondovi thanks to the intercession of Michel de l'Hôpital, and there he married Lucrezia Guerrilla, daughter of a Senator of Turin, after the death of his first wife in 1563. Gouveia died in 1566.

de Silhon, Jean

Born: 1596, Sos in Lot-et-Garonne

Died: 1667, Paris

Simone Guidi

Sapienza Università di Roma, Rome, Italy

Abstract

A French philosopher and politician of the seventeenth century. Among the founders, in 1634, of the *Académie Française*. The author of numerous essays in French noted for their refined style and lengthy exposition. He was Richelieu's secretary and later Mazzarin's Counsellor of State.

Biography

Born in Sos in Lot-et-Garonne in 1596. Died in Paris in 1667. Among the founders, in 1634, of the *Académie Française*. The author of numerous essays in French noted for their refined style and lengthy exposition. He was Richelieu's secretary and later Mazzarin's Counsellor of State. A friend of Guez de Balzac and René Descartes.

Heritage and Rupture with the Tradition

Silhon's philosophical output concerns two areas: political thought, with works like *Le Ministre d'Etat*, and metaphysics, notably with *Les deux vérités* in 1626 and *L'immortalité de l'âme* in 1634.

Political Thought

Silhon's political thought (Thuau 1966) argues for mediation between divine and temporal power based on the idea of an overall balance between the two: natural reason has led people to build for their needs a hierarchy of power completely compatible with the moral principles handed down by God through revelation, which are safeguarded by the clergy. The two orders should therefore develop in parallel, without either hindering the other, so that the good minister will have to understand and constantly maintain consistency between the interests of the state and the dictates of conscience, which are essential prerequisites for the proper exercise of political power. Ideally, therefore, a minister should know how to combine civic and religious understanding. Here Silhon was explicitly referring to Richelieu, whose political actions he justified even in their most controversial aspects such as the war against the Huguenots (which he said was waged against their rebellion, not against their religious belief).

In his work *De la certitude des connaissances humaines* (Silhon 1661) in particular, Silhon takes a firm stand in favor of Catholic absolutism and state Catholicism, drastically curtailing the room for freedom of action of individuals in relation to the political power of the sovereign. Subjects,

being quite unable to manage themselves and the good of society, are relegated to obeying the political authorities without question. As authority is rooted in the Christian religion, which teaches people to obey their sovereigns, good or bad, since all power is legitimized by God, obedience is both sacred and necessary. Authority ultimately derives from the Creator Himself, like a great machine set in motion by God.

Metaphysics and Christian Apologetics

Because his Christianity is so closely tied in with temporal power, the metaphysical and apologetic aspect of Silhon's thought hardly takes us away from his political ideas, in which, especially in the essay *De la certitude des connaissances humaines* (Silhon 1661), the fight against skepticism becomes one of the fundamental starting points (Popkin 2003). Just as his friend Descartes would later do, Silhon sets out to refute atheism and skepticism and tries, in *Les deux vérités* (Silhon 1626), to prove the existence of God and the immortality of the soul (Popkin 2003). His later work would again be in defense of belief in immortality (Fowler 1999). Silhon held that all human certainty is based on the idea, which he took to be universally obvious since it is naturally imprinted in all human beings, that there is a divinity, an idea which he tried to prove in various ways (Popkin 2003). Thus the immortality of the soul must also, he argued, be proved by referring back to the source of all being, i.e., the existence of God, which is required for the existence of any kind of substance, including matter, which has no being in itself, and spiritual substances, which continue to exist after death because that is the will of their Creator (Fowler 1999). Moreover, Silhon seems to take up the doctrine of continuous creation, earlier proposed by Suárez, and later held by Descartes: God is the creator of all things, but He also constantly maintains them as they are, since nothing but God, in this theory of ontology, is really able to sustain its own existence. About the soul, Silhon, who denies that animals have an immortal soul, bases his proof of the immortality of the human soul on God's goodness, which after creating it keeps it in existence. Silhon may be considered one of the

philosophers whose theory of human nature showed a dualism rich in Platonistic elements but did not, as Descartes' dualism would do, break with Aristotelian hylomorphism (Silhon 1634; Gilson 1930). Another interesting aspect of his thought is the distinction he makes between *démonstrations physiques*, which lead to certainties that are absolutely evident, and *démonstrations morales*, which lead to knowledge that though not absolutely certain is well supported. The latter type makes up most human belief (Popkin 2003).

de' Vieri, Francesco

Born: 1524

Died: 1591

Craig Martin

Dipartimento di Filosofia e Beni Culturali,
Università Ca' Foscari Venezia, Venice, Italy
Department of History, Oakland University,
Rochester, MI, USA

Abstract

Francesco de' Vieri II was a proponent of Platonism, who aimed to reconcile pagan thought with Catholic theology. Most of his printed works were written in the vernacular and include meditations on Plato's theology, a treatment of Aristotelian meteorology, and lectures on ethics, love, and literature. He taught at Pisa and gave lectures at the Accademia Fiorentina.

Biography

Francesco de' Vieri II, 1524–1591, also known as “il Verino Secondo,” taught philosophy at Pisa, from 1554 to 1590, where he held chair in Platonic philosophy beginning in 1576 (Kristeller 1956, 292–43). He was the first holder of the chair. De' Vieri's grandfather, Francesco de' Vieri I, had been a professor of first logic then natural philosophy at Pisa and had lectured at the

Accademia Fiorentina on Dante in 1547 (Grendler 2002, 255, 259).

Most of de' Vieri's printed works were composed in the Tuscan vernacular, although he published a defense of philosophy in Latin in 1586. His commentaries, in Latin, on portions of Aristotle's *Physics* and *De anima* and on the tenth book of Plato's *Laws* are extant in manuscript (Lohr 1988, 477). His vernacular treatises address a range of learned topics, many related to his Platonism. Charles Schmitt has characterized him as a proponent of perennial philosophy (Schmitt 1966, 530).

De' Vieri had the explicit goal of showing the compatibility of Platonic philosophy with Christianity in several of his works. His 1577 *Compendio della dottrina di Platone* used Platonic concepts to demonstrate God's existence and providence. In the 1590 *Vere conclusioni di Platone*, he attempted to show that Plato's philosophy demonstrated a number of theological truths including that God is the one, unchanging, and all powerful, creator of the universe. Furthermore, according to de' Vieri, Plato's philosophy bolsters arguments for the efficacy of prayer, the existence of angels, and that divine justice is meted out in the afterlife to humans' immortal souls. In the second part of the book, de' Vieri outlined 15 points where Aristotle and Plato were in agreement (Martin 2014, 107–11).

De' Vieri maintained that his interpretations of Aristotle conformed to those of Thomas Aquinas. In 1582 the Roman Holy Office accused de' Vieri's son, Giovanni Battista, along with Giulio Libri and Girolamo Borri (or Borro), also a professor of philosophy at Pisa, of possessing forbidden books and entertaining heretical ideas. In a letter to Cardinal Giacomo Savelli, asking for the release of his son, de' Vieri emphasized that in his 29 years of lecturing, he had always sided with Thomas Aquinas's interpretation of Aristotle over Averroes'. His son was eventually released. Two years later, once again de' Vieri vowed his fidelity to Thomas Aquinas in *Liber in quo a calumniis detractorum philosophia defenditur*. In this work he determined that Aristotelian and Platonic philosophy present solutions that conformed to Catholic conceptions of God, angels, demons, and the

human soul. De' Vieri's Platonism put him at odds with the physician Andrea Cesalpino and Borri, who favored an Aristotelian stripped of Platonism and who was in many cases partial to Averroes (Schmitt 1972).

De' Vieri's other printed works, all in the vernacular, addressed numerous learned subjects, including psychology, ethics, history, literature, aesthetics, and natural philosophy. His *Trattato delle Metheore*, 1573, explains sublunary phenomena, following, for the most part, the first three books of Aristotle's *Meteorology*. The second edition, printed in 1582, includes the subject matter of *Meteorology* 4. This work is similar in its scope and content to university teachings on meteorology (Martin 2012, 10–11).

Some of his other works seem distant from the setting of Renaissance universities. For example, his 1587 discourse on gardens, *Discorsi delle maravigliose opere di Pratolino*, includes a history of gardens, comparing contemporary ones to ancient examples, before moving to a discussion of Aristotle's and Plato's views on the function of myth in philosophy. Several of his works derive from lectures given at the Accademia Fiorentina, including a lecture on ideas and beauty, *Lezzione dove si ragiona delle idee et delle bellezze*, 1581. In this work, de' Vieri considered not only Plato's and Aristotle's views but also meditated on the concepts of beauty found in Petrarch's sonnets. Petrarch's Laura is the subject of another treatise from the same year that looks at greatness and fortune.

De Vieri's works show him participating in some of the major movements of Renaissance philosophy, including Neoplatonism, the interpretation of humanist literature, and vernacular Aristotelianism.

Death, Renaissance Conception of

Grant Williams

Department of English Language and Literature,
Carleton University, Ottawa, ON, Canada

Abstract

With the advent of the Reformation, Protestantism did not so much as abolish the Catholic death arts as revise and add to them. The Renaissance's every day awareness of and meditation upon mortality, epitomized by the phrase *memento mori*, would face slow yet steady erosion from humanism's revival of classical thought. Humanist thinkers and natural philosophers began to question prevailing religious verities and practices by engaging with Platonist, Aristotelian, Stoical, and Epicurean *topoi* on death, chief among which was the status of the soul's immortality. As humanism gave way to scientific inquiry, the growing materialism and empiricism of the seventeenth century performed the spadework for the next century's endorsement of the individual's total annihilation, notoriously promulgated by the French philosophes. Occupying a liminal position between medieval religion and the Enlightenment, the Renaissance's heterogeneously complex attitude toward the death arts has sparked ongoing debate on its legacy. Did the Renaissance lead to the enrichment or impoverishment of our contemporary conception of death?

Heritage and Rupture with the Tradition

Although the Reformation shook up medieval Catholicism as “a cult of the living in the service of the dead” (Galpern 1974), the Renaissance modified – not eliminated – this religion’s many death arts from the *ars moriendi* to the danse macabre and memento mori, as well as developing its own distinctive commemorative methods, such as the genres of elegy and epitaph. Religiously motivated scripts and habits around dying, death, and the dead still preoccupied the living in the Renaissance. Humanism’s fetishization of reviving classical writers and voices may also be said to contribute to the mindset of dwelling upon the dead. However, it is with the humanist enterprise that we begin to see students of the main schools of ancient philosophy implementing ideas that displace the hegemony of theological discourse in thinking about mortality. A favorite source of ethical *exempla*, the principled deaths of Socrates, Cato the Younger, and Seneca the Younger offered a philosophical alternative to the fabular executions of saints and martyrs and predisposed humanists to the *topos* of managing one’s death through courage, not fear, and through premeditation, not avoidance. In his essays, Michel de Montaigne wrestles with this *topos* extensively, influenced as he and so many other writers were by the stoicism of Seneca’s moral letters and dialogues. His Senecan ruminations, bearing out his famous dictum “to philosophize is to learn to die,” yield later on to the outlook that death requires no intellectual preparation, no death art, because it is – as his experience with plague victims showed him – a natural part of life (Montaigne 1993).

Earlier in the Renaissance, the *topos* of the immortality of the soul proved a major battleground for religious controversy, with Marsilio Ficino mobilizing Platonism to champion the soul’s divine origins and Pietro Pomponazzi deploying Aristotelian principles to assert its finitude. A fixation on this *topos* would continue unabated into the seventeenth century, when, for example, René Descartes, who was invested more in scientific than in humanistic inquiry, sought out natural reasons for the Platonic dualism of the soul outlasting the body (Descartes 1989). The ancient

construct of the *psyche* or *animus*, so integral to sustaining the hope of the self’s prolongation after breathing one’s last breath, met its match in the multiplication of empiricist and materialist theories during the ascendancy of science. Kindled by the Epicurean atomism of Lucretius, thinkers such as Thomas Hobbes and John Locke denied altogether the existence of the soul’s immaterial substance and laid the foundation for the philosopheme of total annihilation, which reached its most direct expression – that is, without Pascalian hedging about the afterlife – in the atheism of the eighteenth-century French Enlightenment.

If the Renaissance did not propose new or innovative insights into mortality because of the dominant humanist project of recovering classical learning, the period’s transitional status does pose the larger question of what exactly happened to Western Europe’s mentalité toward dying, death, and the dead. In the passage between medieval times and the Enlightenment, when science emerged from superstition, capitalism from feudalism, secularization from religion, and the individual from the collective, did the Renaissance enhance or diminish our relationship to death? According to Paul L. Landsberg (1977), the heightened consciousness of one’s own mortality during the disintegration of the feudal order makes possible the progress of human individualization freed from the conformity of clan thinking. But for Philippe Ariès (1991), the liminal period of the Renaissance has impoverished contemporary society: the increasing privatization of the funeral and burial led away from the recognition of mortality as belonging to communal life and toward the modern fear and denial of one’s own *quietus*. Other cultural and intellectual historians of note who have addressed this question of a historical break in the attitude toward death include Johan Huizinga (1996), Michel Foucault (1975), Michel Vovelle (1978), Arthur Imhof (1996), and Thomas Laqueur (2016).

Decembrio, Pier Candido

Eleonora Gamba

Dipartimento di Scienze storiche, geografiche e dell'antichità - DiSSGeA, Università degli Studi di Padova, Padua, Italy

Abstract

A leading figure of the Lombard humanism with Francesco Filelfo, Pier Candido Decembrio was a prolific, but not gifted author. He used to write to ingratiate himself with

powerful figures or directly on demand of his patrons, the Visconti in Milan, the papacy, the Aragons in Naples, and the House of Este in Ferrara. His major work was an encomiastic biography of Filippo Maria Visconti, but his translations of classics, especially Plutarch, the historians, and Plato, had a fair circulation too. His renderings were similar to medieval ones, because Decembrio preferred to preserve the meaning of the original texts and not to make his prose elegant, as is clearly shown by his versions of Platonic dialogues *Republic* and *Lysis*. In spite of this, he felt free to remove some philosophical passages that were too difficult to understand or could offend moral standards.

Alternate Names

[Decembrius, Petrus Candidus](#)

Biography

Pier Candido was born in Pavia on the 24th of October 1399 and owes his name to the Candiot bishop Pietro Filargis, whom his father Uberto worked for and who stood as godfather to him. In 1402 he moved to Milan, where Uberto began to serve the duke Gian Maria Visconti. In 1419 he became himself the secretary of Filippo Maria Visconti and began to travel in Italy and Europe on diplomatic missions. This period was tormented because of the loss of two of his sons, of his father (1427), and of both his mother and his brother Modesto in the same year 1430. When Filippo Maria died in 1447 and the Ambrosian Republic was constituted, he showed himself loyal to the city he always regarded his land and became secretary to the new government. With the advent of Francesco Sforza in 1449, he was discharged and compelled to wander in search of a new patron. The Pope Nicholas V received him as *magister brevium*, but soon after his death and the election of Calixtus III, he left the Papal Court and went to Naples to Aragon family. In 1459 a new troubled decade began: in straitened circumstances, he turned to the Gonzagas, the Sforzas,

the Estes, and to the Pope, but his desires were never fulfilled. Furthermore, in 1464, he lost his wife Caterina and a year later married Battistina. At last, in 1467 he was received at the court of Ferrara and remained there happily until March 1476 serving Borso and Ercole. Coming back to Milan, he died there in December 1477 and was buried in S. Ambrogio cathedral. His library, left to his second wife Battistina, passed afterwards to the Milanese monastery of S. Maria delle Grazie, but has been dispersed at its suppression (Viti 1987; Hankins 1991).

Works and Themes

Only a small part of the huge literary production of Pier Candido has survived, but it is enough to reconstruct his skills and interests. Omitting some minor works of humanistic inspiration (orations, verses and epigrams, a grammar textbook, etc.), he wrote historical works to celebrate his patrons. The most successful was the *Life of Filippo Maria Visconti*, a biography that he did not benefit from during his life, but became afterwards quite famous. Other less known titles are the biography of Francesco Sforza (1461–1462), the *Vita Herculis Estensis* (1471), and the tardy *Opuscula historica* (Pyle 1988), which he dedicated to Borso d'Este.

The relationships with international leaders and with contemporary humanists are well depicted in his correspondence (Zaccaria 1952; 1967; Zaggia 1993b), never completely published, but written in three different manuscript collections: the first one covers the years 1419–1433 and was offered to the archbishop of Milan Bartolomeo Capra, with the title *Epistolae iuveniles* (1433); the second one is a choice of letters dated 1433–1443, with some later additions, dedicated to the secretary of the Viscontis Simonino Ghilini; and the last selection (1440–1468) is dedicated to the Este referendary Ludovico Casella (1468).

Some works are simply compilations of ancient sources, such as the *Historia peregrina* (Zaccaria 1956) and the *De animantium naturis* (Pyle 1984). The *Historia* is divided into three

books, entitled *Cosmographia*, *De genitura hominis*, and *De muneribus Romane reipublice*, respectively. They are a revisiting of Orosius, Aristotle's *Historia animalium*, Avicenna's *De animalibus*, Pliny, and Macrobius. The other work, composed at the end of the 1450s and dedicated to marquis Ludovico Gonzaga, is an illustrated bestiary focused on marvelous creatures, animals, and monsters and founded prevalently on medieval authors (Albertus Magnus, Thomas of Cantimpré, Vincent of Beauvais), although Aristotle and Pliny are often quoted as well.

Most of his efforts were directed to Latin and vernacular translations of classical authors, among which must be mentioned the *Historia Alexandri Magni* by Curtius Rufus, the *Corpus Caesarianum* (Ponzù Donato 2012), and Leonardo Bruni's *De primo bello Punico* (1438), dedicated to Filippo Maria Visconti and Inigo de Avalos, respectively. Between 1440 and 1442, he translated books I–IV and X of *Iliad* and drew up a *Vita Homeri*, which is not an original work, but the result of the juxtaposition of what he could find in the ancient sources. At the Papal Court, on demand of Nicholas V, he translated Appian (1450–1454; Zaggia 1993) and then was involved in a project around Diodorus Siculus (1455): Poggio Bracciolini had the first books to translate, George of Trebizond the central section, and Decembrio was charged with books XVI–XX, but he could carry out just the first 49 chapters of book XVI. One of his favorite authors was Plutarch: after 1460, he composed the *Ex illustrium comparationibus in Plutarcum Cheronensem libri quattuor*, an abridged Latin version of the *Lives*, which remained unfinished. In spite of his criticism of the translations made by Leonardo Bruni, Jacopo Angeli, and Guarino, he used them extensively to write his epitome (Resta 1962; Gionta 2005).

He had never shown any particular attitude toward philosophy, but he dealt with Platonic texts such as *Republic* and *Lysis*, of which he proposed Latin renderings.

His *Celestis Politia* was written between 1437 and 1440, drawing from the rendering produced by Manuel Chrysoloras and embellished by his

own father Uberto, which he found in the manuscript now Milano, Biblioteca Ambrosiana, B 123 inf. Its readings were amended with the Greek text of Milano, Biblioteca Ambrosiana, E 90 sup. (Fera 2005). These supplements and the rendering of political terms were Decembrio's greatest merit (Gusmini 2012).

In 1437 he faced the book V, which touches the discussed theory of the common possession of women and property. Pier Candido solved it modifying the meaning of the Platonic thought in the Latin text so that the subordination of individual conscience to reason of State and the consequent admission of incest were dissimulated. The fifth book was sent in 1438 to Humphrey of Gloucester, who was the dedicatee mentioned in the prefatory letter, and was followed by books I–IV in 1439. The translation of the whole work was completed in August 1440, books I–IV and VII–IX given to Humphrey, V to Giovanni Amideo, VI to Alfonso de Cartagena, and X to Francesco Pizolpasso. Whereas it was spreading in Italy, England, Switzerland, and Spain, Angelo Decembrio picked a quarrel with his brother Pier Candido and accused him of copying their father and Chrysoloras' rendering (Zaggia 1993b). The relationship between the two brothers cooled, and the *Celestis Politia* did not find great success, because of the diffusion of the translations by Uberto, Antonio Cassarino, and Marsilio Ficino.

Between the end of 1454 and March 1455, he devoted himself to the translation of *Lysis*, which he dedicated to Ottaviano degli Ubaldini. Decembrio could read the Greek text in the manuscript Wrocław, Biblioteka Uniwersytecka, Ack. 1949/60, which he had bought in Siena on the 13th of September 1442. The two extant manuscripts (Ferrara, Biblioteca Comunale Ariostea, II 66 [= F] and Madrid, Universidad Complutense, Biblioteca Historica, Mss. 129 [= M]) bear versions a little different, because both derive from the same (now lost) model, but M shows traces of a revision by Decembrio himself on the basis of a new inspection of the Greek text (Gallego Moya 2001; Martinelli Tempesta 2010). As Decembrio had done with *Republic*, here as well he tried to improve the meaning of the text, when it was not completely clear to him, modifying the Greek text

with corrections and conjectures. As a result, the original Platonic thinking was often distorted and lacunae or small errors of the Greek model were amended only in some isolated cases. In his preface, he openly stated that he had done an excerption, as Cicero and Virgil did. His major aim was to make Plato acceptable to the Christian moral view, and in order to do so, he moralized and censored those passages that sounded improper and particularly those explicitly related to pederasty or homosexuality. Sometimes, instead, he cut off passages he could not understand. His translational technic shows a literal adherence to the Greek model, with the rendering of technical terms with calques from Greek, according to the position he had taken up at the end of the so-called *controversia alphonsiana*, when he had distanced himself from the technic *ad sententiam*, which Leonardo Bruni had previously supported in his rendering of the *Nicomachean Ethics*. Decembrio's prose therefore seems literal, clumsy, and similar to medieval translations, from which he inherited the rendering of the participle of the verb to be with the Latin *ens* or *existens* (Martinelli Tempesta 1997; Hankins 2003; Martinelli Tempesta 2009).

Decembrio's philosophical interests can be seen also in his seemingly original works: after a careful exam, they prove to be inspired by classical or medieval *auctoritates*, not always explicitly quoted. This is what happens in his juvenile dialogue *De vitae ignorantia*, written after 1428 on the basis of the *Dialogus de dispositione vitae suae* by Lombardo della Seta, a friend and follower of Petrarch. Pier Candido supports the hedonistic-epicurean theory that happiness and spiritual pleasures coexist with a quiet life and a moderate pleasure coming from worldly things: if you want to be happy, first of all you need riches which free you from everyday cares (Viti 1987).

The Platonic doctrine is clearly recognizable in the dialogue *De humani animi immortalitate* (1460), dedicated to Francesco Visconti and depending on the pseudo-Augustinian *De spiritu et anima*. There Decembrio reflects upon the human soul: unique of its kind and not consisting of several parts, it has a vital force unconnected to the contingent human forms it may have and is

therefore immortal; it has been created by God; there are differences among rational, irascible, and concupiscible soul, as well as its behavior differs if it is directed at the flesh or God. The conclusion is that men have to strive to live as spiritual as possible. This is in contradiction to the theories proposed in the *De vitae ignorantia*, due to the different sources they stand upon, but the work itself “is noteworthy for its attempt to show the large area of agreement between Plato and Christianity on the subject of the immortality of the soul” (Hankins 1991, II, p. 418).

Dee, John

Born: London, 13 July 1527

Died: London, 26 March 1609

Noam Flinker

Department of English Language and Literature,
University of Haifa, Haifa, Israel

Abstract

Mathematician, geographer and navigational expert, John Dee combined a firm grasp of sixteenth century science with his occult studies of alchemy and Kabbalah. Intellectually attuned to Renaissance Europe, he often found it necessary to defend himself against accusations of conjuring and the practice of black magic. He prepared horoscopes for

royalty and, while highly respected by Elizabeth and many of her courtiers, was likewise feared and even mocked by others. His practice of trying to consult with angels in order to extend his scientific investigations made him dependent upon the manipulative assistance of “scryers” or interpreters of mystical appearances in special show stones. His lack of social and political tact generally prevented him from gaining any material benefit from Elizabeth’s belief in his knowledge and insight.

Biography

John Dee matriculated at St. Johns, Cambridge, at aged 15 where most of his teachers were Catholic humanists and that study in Britain prepared him for his advanced work in Europe. Aside from logic and mathematics, Dee began to study alchemy at St. Johns. After taking his MA and becoming an underreader in Greek at Trinity (Cambridge), he studied advanced mathematics and civil law at Louvain in the Netherlands. At Cambridge and Louvain, he studied alchemy and astrology with an emphasis on advanced mathematics, navigation, and geography. Throughout his career, Dee would integrate these apparently diverse interests. At Louvain he conferred with European intellectuals such as Gerard Mercator, Gemma Frisius, Antonius Gogava, and later with Guillaume Postel in Paris. With his return to Trinity (1548), he added to the research the materials he brought from Europe and later failed to interest Queen Mary in establishing a library to gather rare texts endangered by the dissolution of the monasteries. Dee unsuccessfully petitioned Mary and then Elizabeth for advancement that would help fund his research. Although ordained a Roman Catholic priest (1554), Dee married twice and remained relatively unconcerned with the rituals of either the Roman Catholic or a Protestant Church. Elizabeth constantly encouraged Dee about possible livings, but the politicians required to facilitate the appointments avoided finalizing them. His expertise in geography and navigation made him a key resource in the search for a northwest passage. Although he amassed a huge

library which he opened to various scholars, many of his books and manuscripts were stolen during an extended stay in Europe (1583–1589). He believed that his scientific endeavors had to be supplemented by his occult research. His expertise in mathematics and navigation was of major importance for his time but his reliance on communication with angels made it possible for others to deceive him and distort his material measurements and understanding. He claimed that he had been offered a permanent position by at least one European monarch but preferred to wait for something similar from Elizabeth. After her death, Dee received little or no support from James and died penniless in London at age 82.

Heritage and Rupture with the Tradition

Until recently Dee was considered somewhat insignificant for Elizabethan culture and politics, but a recent biography (Parry 2011) makes his centrality for the queen and her court unmistakable. She consulted with Dee many times, although she rarely rewarded his advice as he desired. In 1555 he cast her horoscope (along with ones about Mary and Philip) and was even arrested for a short time thereafter, accused of conjuring. In 1564, when *Monas Hieroglyphica* was rumored to defend conjuring, Elizabeth silenced the reports. She consulted with him about alchemy and gave credence to his ultimately false prediction that Spain would invade England in the 1590s. Parry shows that Elizabeth and many of her courtiers were firm believers in Dee’s mystical approach to science.

Innovative and Original Aspects

Dee was primarily concerned with a scientific account of the material world as a significant aspect of praising God’s creation. In his “Mathematical Preface” to Euclid (1570), he claimed that perspective could be used to measure the cosmos so that astronomy became an aspect of astrology. His studies with Mercator made him an expert in geography and navigation. The vast private

library that he managed to amass allowed him to share and sell knowledge to his contemporaries.

Impact and Legacy

Dee's well-known work on mathematics, geography, and navigation made him esteemed yet feared during his lifetime. Meric Casaubon's publication of his diaries made Dee a laughing stock of the Royal Society, especially the account of wife swapping required by Edward Kelley. Francis Yates (1969) claims that Shakespeare idealized Dee as Prospero in *The Tempest*. Peter Ackroyd's novel (1993) provides a fascinating fictional treatment of Dee's life, while Neil Gaiman's graphic novel (2003) clearly presents Dee in the character of Dr. Strange.

Del Bene, Judah

Born: ca. 1618, place uncertain, probably Mantua
Died: April 2, 1678, Ferrara

Adam Shear

Department of Religious Studies, University of Pittsburgh, Pittsburgh, PA, USA

Abstract

Judah del Bene is an Italian rabbi and preacher in Ferrara in the early seventeenth century.

Alternate Names

[del Bene, Judah Assael](#); [del Bene, Judah ben David](#)

Biography

Judah del Bene was the son of a prominent rabbi, Eliezer David del Bene of Mantua (d. 1635), whose use of secular work in sermons was controversial (Kaufmann 1896). He was educated in the typical eclectic education of early modern Italian intellectuals and had extensive knowledge of Talmudic and halakhic literature, biblical exegesis, and philosophical and scientific texts. Del Bene spent most of his life in Ferrara where he developed a reputation as a preacher, philosophical writer, and Talmudic scholar.

Heritage and Rupture with the Tradition

Del Bene was not interested in kabbalah, which was of major interest to most Italian Jewish intellectuals of this period (Ruderman 1995). Del Bene is sometimes understood as breaking from the philosophical legacy of early modern Italian Jewish thinkers, but recent scholarship (see below) has challenged and revised this view.

Innovative and Original Aspects

Del Bene has long been perceived as a conservative critic of philosophy (see Barzilay 1967). But his position is better understood in terms of an anti-rationalist critique of Aristotelianism along with some openness to new scientific ideas (Bonfil 1992, 77–79; Ruderman 1995, 187–199; and references cited there). Thus, contra Barzilay, he might be best understood as part of a synthetic tradition of Italian Jewish intellectuals interested in using Maimonides, Judah Halevi, and non-Jewish thinkers, like Socrates and Plato, to understand science and philosophy in relation to biblical and rabbinic traditions (Shear 2007, 58 and references there). In many ways, Del Bene's work fits into traditions of early modern skepticism, but also contains a certain amount of knowledge of new scientific and geographic discoveries, albeit with "little evidence of any technical mastery of the sciences" (Ruderman 1995, 188–195). Del Bene was also among a group of other

seventeenth-century Jewish intellectuals interested in the figure of Socrates, including the Venetian apologist Simone Luzzatto. (Bonfil 1992, 78). Robert Bonfil has outlined some ways in which Del Bene's fideistic and moderate platform in his work for elite readers (*Kisot le-Veit David* [Thrones of the House of David, after Psalms 122:5]) takes a more conservative turn in his unpublished sermons, as recorded by a listener in an unpublished manuscript. In these unpublished sermons, the rejection of secular and scientific pursuits was more wide-ranging and less nuanced than the anti-rationalist approach in the *Kisot le-Veit David* (Bonfil 1992, 80–85). Bonfil suggests that this difference might be analyzed further for insight into how Del Bene innovated a modern approach to science which disentangled it entirely from religion (Bonfil 1992, 82; cf. Ruderman 1995, 196).

Impact and Legacy

Albeit somewhat influential in his lifetime and later in the seventeenth century, del Bene had almost no substantial influence on future developments in Jewish thought. His sermons remained in manuscript, and *Kisot le-Veit David* was not republished.

Del Monte, Guidobaldo

Maarten Van Dyck
Department of Philosophy and Moral Science,
Ghent University, Ghent, Belgium

substantially to a better understanding of the mathematical foundations of these sciences. He was also one of the most important patrons of the young Galileo.

Biography

Guidobaldo del Monte (Pesaro, 11 January 1545–Pesaro, 6 January 1607) was one of the most prominent Italian mathematicians from the second half of the sixteenth century. He was a nobleman from the Duchy of Urbino and occupied a central position at the courts of the Dukes Guidobaldo II and Francesco II della Rovere for large part of his life, until he fell out of favor in the 1590s (Frank 2011). He studied at the University of Padua, but he probably received most of his mathematical education from Federico Commandino at court in Urbino. He combined practical work as an architect, designer of instruments, and surveyor of fortifications (see numerous contributions in Becchi et al. 2013), with theoretical works on astronomy, perspective and mechanics. In cosmology he appears to have been an orthodox Aristotelian, as judged by his reaction to the supernova of 1604 (Meli 1992; Giostra 2013). Notwithstanding this latter position, he was also one of the most important patrons of the young Galileo. Together with his brother, Cardinal Francesco Maria del Monte (well known for having been a patron of Caravaggio), he helped Galileo secure his first teaching positions at the University of Pisa (in 1589) and Padua (in 1592) (Shea 2013). Around this period, Guidobaldo and Galileo also collaborated on an experiment, recorded in Guidobaldo’s notebook that can be seen to have contained the germs of Galileo’s revolutionary new science of motion by showing that the trajectory of projectiles is approximately parabolic (Renn et al. 2000).

Innovative and Original Aspects

Guidobaldo’s most important books were the *Mechanicorum Liber* from 1577 (with an Italian translation supervised by Guidobaldo in 1581), the *Paraphrasis* from 1588, and the

Abstract

Guidobaldo del Monte (1545–1607) was one of the most prominent Italian mathematicians from the second half of the sixteenth century. He published influential texts on Archimedean mechanics and perspective that contributed

Perspectivae Libri Sex from 1600. He also prepared Commandino's edition of Pappus' *Collectiones Mathematicae* for printing in 1588, after the former's death (see Rose 1976).

The *Mechanicorum Liber* was probably the most influential treatises on mechanics of its time (see Meli 2013; Laird 2013 for some reflections on its place in the history of mechanics). It carried out in detail an idea taken over from Pappus (and, through Pappus, Heron of Alexandria): to reduce the operation of the so-called simple machines (lever, pulley, axle in a wheel, wedge and screw) to the law of the lever. He gave careful and rigorous treatments of the first three (though the discussion of the axle in a wheel is somewhat hampered by the fact that Guidobaldo had no way of dealing with a bent lever, or equivalently, forces applied in another direction than the weight of bodies), but he had to limit himself to qualitative statements regarding the wedge and screw (a problem aggravated by the fact that he lacked a satisfying treatment of the inclined plane, which played a crucial role in the analysis of both instruments). Importantly, Guidobaldo put the concept of center of gravity, as defined by Pappus, at the foundation of the science of mechanics. This led him to an extensive discussion on the possibility of what is currently called indifferent equilibrium, which arises when a body is suspended in its center of gravity: it will remain in any position given to it. This possibility had been denied by earlier authors (such as Jordanus, Tartaglia, and Cardano), who were severely criticized for this by Guidobaldo (see Meli 2006; Frank 2011; Renn and Damerow 2012; Van Dyck 2006 for discussion). Partly in reply to some criticisms on his book, he published an extended commentary on Archimedes' text on the equilibrium of plane figures in his 1588 *Paraphrasis*. This text was the first printed in-depth analysis of Archimedes' proof of the law of the lever in modern times (see Frank 2011; Van Dyck 2009, 2013). Guidobaldo's texts on mechanics provided an original synthesis of existing ideas and treatments, which actually created what is often referred to as the Archimedean tradition by showing how to conceptually integrate Archimedes' highly abstract mathematical demonstration of the law of the lever with an analysis of actually operating machines.

Guidobaldo's book on perspective was similarly directed toward foundational issues underlying an established practice. He was the first to give a satisfying and general mathematical treatment of the fundamental principles underlying perspective constructions (Andersen 2007, 2013). The core of his innovation consisted in a rigorous establishment of the concept of a general vanishing point for any set of parallel lines – even if Guidobaldo might not have realized the full generality of his results.

Abstract

Giambattista Della Porta was born in Naples in 1535. His first teachers were his maternal uncle, who had a well-endowed museum and a large library, and his brother Giovan Vincenzo. Della Porta became involved in the study of nature at an early age. He was a

promoter and member of several academic societies. He founded the *Academia Secretorum Naturae*, and in his later years was one of the most prominent members of both the Lincean Academy and the “Accademia degli Oziosi” (Academy of the Idle). He died on 14 February 1615, attended to by his daughter Cinzia.

The two editions of *Magia naturalis* (1558, 1589) preserve the most significant aspects of the scientific thought of the contemporary Neapolitan culture: an “analogical” view of man and the universe and a method of investigation directed toward experimental verification of the *auctoritates*.

In addition to the two important editions of *Magia naturalis*, Della Porta also published three significant physiognomical works: *De Humana Physiognomonica*, *Phytognomonica*, and *Coelestis Physiognomonica*. He intended to follow these works with a *Chiropysiology*, which, however, was only published posthumously, and a *Metoposcopy*.

His demonology plays a particularly important role in his thought, as the result of a coherent examination of the Latin philosophical tradition, which he reread in the light of his inclinations as a man of science, as well as that of the particular historical, political, and cultural climate of Counter-Reformation Italy.

In a universe structured “according to degrees,” from the first heaven it is possible to ascend to the intelligences (which Della Porta, following Avicenna and the Author of *Liber de causis*, identifies with angels), and on up to God himself, who is the creator of form, as well as the universal cause of every natural entity. The same demons, if they acted, would only operate in accordance with the inviolable “physical laws” of *ordo naturae*. The secrets, although they cannot be explained by the criteria of Aristotle’s rationality, are nevertheless attributed by Della Porta to within the known. They, in fact, are simply the effects of the “particular properties” of things, “buried” by God in the “nature’s womb.”

Biography

Giambattista Della Porta was born in Naples in 1535 of Leonardo Antonio and a Calabrian mother who was a sister of Adriano Guglielmo Spadafora. He had three siblings, Giovan Vincenzo, Ferrante, and a sister, whose name is not known. He married and had a daughter called Cinzia. His first teachers were his maternal uncle, who had a well-endowed museum and a large library, and his brother Giovan Vincenzo, who was a scholar of astrology, natural philosophy, and antiquity. Della Porta became involved in the study of nature at an early age. He was eclectic, curious, and as committed to “experimentalism” as to the study of antiquity, and he surrounded himself with both scholars and craftsmen, alongside whom he often worked. He was a promoter and member of several academic societies. He founded the *Academia Secretorum Naturae*, and in his later years was one of the most prominent members of both the Lincean Academy and the “Accademia degli Oziosi” (Academy of the Idle). He also travelled extensively throughout Italy and Europe, thanks to which he came into contact with the leading cultural exponents of his time. He died on 14 February 1615, attended to by his daughter Cinzia (Fiorentino 1880; Gabrieli 1927; Sirri 1968; Muraro, 1978; Piccari 2007).

Heritage and Rupture with the Tradition

Giambattista adopted both his method for studying analogies between the macrocosm and the microcosm and his inclination to put the “secrets” of the ancients directly to the test from the Neapolitan scientific circles of his time. The two editions of *Magia naturalis* (1558, 1589) preserve the most significant aspects of the scientific thought of the contemporary Neapolitan culture: an “analogical” view of man and the universe and a method of investigation directed toward experimental verification of the *auctoritates* (Corsano 1959; Badaloni 1960; Balbiani 2001; Verardi 2015).

In addition to the two important editions of *Magia naturalis*, Della Porta also published three significant physiognomical works: *De Humana Physiognomonica*, *Phytognomonica*, and *Coelestis Physiognomonica*. He intended to follow these works with a *Chiropysiognomy*, which, however, was only published posthumously, and a *Metoposcopy* (Trabucco 2003).

His physiognomical works form a sort of encyclopedic *corpus*, in which Della Porta addresses both the *Physiognomonics* of pseudo-Aristotle, as well as several other ancient and medieval physiognomical works, and attempts to study and investigate the “great book of nature” *per signa externa*, in a world conceived of as the “creative” work of God (Della Porta 1588, 1996, 2011).

With regard to his natural magic, it should be noted that his position was distinct from that of certain medieval magicians, such as Michael Scotus (c.1175–c.1232) and Cecco d’Ascoli (1269–1327), as well as that of the Hermetic magicians of the Renaissance. His universe is closer to that of most thirteenth-century natural philosophers than to the Neoplatonic-Hermetic universe of Marsilio Ficino or Agrippa of Nettesheim, which was pervaded by celestial spirits and demons. In the physical realm, many of his positions were similar to those of Albert the Great (c.1206–1280), particularly in regard to Aristotle’s doctrine of natural places, which Albert had reinterpreted in an astrological key that Della Porta adopted with explicit reference to the master of Cologne. His hierarchical structure of the universe, ordered “according to degrees,” was taken from Avicenna and the author of *Liber de Causis*, as was his identification of the angels with heavenly intellects. The sublunar world was governed “by the inviolable law of nature,” i.e., by precise physical and astrological laws that did not affect the freedom of man’s rational soul in any way. The stars were considered as physical bodies that acted on the human material plane through motion and heat. It should be noted, however, that Della Porta’s thought also contains aspects that are not found in his medieval sources: (1) a tendency to discard certain

metaphysical presuppositions that hindered natural research; (2) a vision of nature in “vital” and “harmonic” terms.

His demonology plays a particularly important role in his thought, as the result of a coherent examination of the Latin philosophical tradition, which he reread in the light of his inclinations as a man of science, as well as that of the particular historical, political, and cultural climate of Counter-Reformation Italy.

The topic, as already mentioned, is fully addressed in *Criptologia*, the fifth book of the unpublished *Taumatologia*. In this text, by taking some opinions held by William of Auvergne and inserting them in the context of the Platonic-Augustinian tradition, Della Porta does not exclude that demons may act in the world. Both of them sustain that the damnation of human beings is always the aim of such action. Della Porta, as a philosopher, puts greater faith in man’s cognitive abilities, so much so as to state, in the *Index* to book V, that he boasts to have spent his whole life unveiling the deceptions of demons by studying nature. Della Porta states that demons, in order to confuse men, add words and spells to the natural processes which are totally ineffective as these words and spells are nothing but blasphemies and curses. In fact, the effects of those alleged spells simply derive from natural causes (Della Porta 1982).

Hence, the demons, although endowed with particular wisdom, are, in Della Porta’s opinion, creaturely beings. As such, Della Porta’s position seems partially similar to that of Vitellione, according to whom, although rarely, demons may perform actions that are apparently miraculous, however are usually caused by optical illusions or the hallucinatory phenomena of sick minds. It is nevertheless important to remember that Della Porta is a careful student of perspective, by means of which, already in the first *Magia*, he rationally explains some optical illusions. So, Della Porta’s position seems to oscillate between that of *theologizantes* like William of Auvergne and that of rationalists like Vitellione, and he seeks a subtle and difficult compromise (Valente 1999; Verardi 2013, 2014, 2015).

Innovative and Original Aspects

The pages of *Magia naturalis* in which Della Porta explains his theory of nature are of particular significance for grasping the originality of his thought and in turn provided the basis for a specific view of natural occult forces. The elements, Della Porta writes, are the “first parents,” the “seed” of all things. They are the “material principle of the natural body” they reside in the sublunary world and can be altered “by a perpetual permutation.” The earth is the only fixed element and is placed at the center of the world. The others, instead, are moved in circles by the motion of the sky. These four “bodies” have four corresponding elementary qualities: hot, cold, wet, and dry. Of these qualities, two are active: the hot and the cold, and two are “passive,” the wet and the dry. Then, there are the “secondary” qualities: they “serve” the first and operate afterwards. Not always do the virtues of things come from the mixture of the “qualities” of the elements. Besides, there are three “efficient causes” of a natural substance: matter, form, and quality of the elements. The action of form is not completely cognizable by the philosopher. In this sense, it is “occult.” According to Della Porta, the action of form in the production of a given phenomena cannot be known, but by its effect it is always possible to locate the “particular property” that the effect produces. Such property depends, in turn, on the complexity of the qualities of elements that make up the natural substance, as well as on the “occult” action of form. Although the “occult” is unknown, the action of form comes from the starry sky: interpreted by Della Porta in the physical (Aristotelian) sense, and not as populated by celestial demons as in the Neoplatonic-Hermetic cosmologies. In fact, the heavenly bodies act upon the things in the world because of their motion and heat. The form allows the celestial influences to be transposed, giving as a remedy its specific, “peculiar property.” How this happens – Della Porta writes – we are not allowed to know, at least according to the canons of Aristotelian rationality (that is, with probable or evident demonstrations). The action of form, despite being “occult,” is however an action of physical nature, and so its location is physical: the first heaven. This

is not in contrast with the fact that form ultimately has a divine origin (Della Porta 1558, 1589, 1982).

Impact and Legacy

In a universe structured “according to degrees,” from the first heaven it is possible to ascend to the intelligences (which Della Porta, following Avicenna and the Author of *Liber de causis*, identifies with angels), and on up to God himself, who is the creator of form, as well as the universal cause of every natural entity. The same demons, if they acted, would only operate in accordance with the inviolable “physical laws” of *ordo naturae*. The secrets are simply the effects of the “particular properties” of things, “buried” by God in the “nature’s womb.” To discover these secrets (even by the verification of those passed down from ancient times) is for Della Porta to unveil the deceptions of demons: since what is natural can always be attributed to the first universal cause, namely God.

Della Porta devoted a lifetime of research to his role as a “hunter of secrets,” making him one of the most prominent figures in the Italian and European debate on the rationalization of “occult” natural phenomena until the start of the Eighteenth century.

Herbalists, philosophers, doctors, and intellectuals all referred to him when combating superstition. His works were widely read and reprinted numerous times until the eighteenth century (Ferrone 2000).

Delmedigo, Elijah

Born: c. 1455

Died: 1492/3

Giovanni Licata
Scuola Normale Superiore, Pisa, Italy
Istituto Nazionale di Studi sul Rinascimento,
Florence, Italy

Abstract

Elijah Delmedigo is one of the most representative Jewish philosophers of the Italian Renaissance. As a staunch follower of Averroes, he played a key role in disseminating Averroes' ideas among early modern scholars and philosophers through commentaries, *quaestiones*, and various translations from Hebrew into Latin. Between 1481 and 1486, he was among the Jewish collaborators of Giovanni Pico della Mirandola and assisted him in his investigations in Aristotelian and Averroistic philosophy. Delmedigo is known mainly for his short treatise *Behinat ha-Dat* (*The Examination of Religion*), a philosophical-religious work that influenced, among others, Spinoza. In it he reinterpreted some of the key issues in Averroes' *Decisive Treatise* in the light of Jewish context.

Alternate Names

Delmedigo, Elijah ben Moshe Abba; Hebreus Cretensis, Helias; Del Medigo, Elijah; del Medigo, Elia

Biography

Elijah Delmedigo was born in Candia (nowadays Iraklion), in the island of Crete. His date of birth is debated among scholars, but some external evidence suggests that it might be around 1455 (Licata 2013a, pp. 47–49). Crete – a strategic island for trade in the Mediterranean Sea – had been under Venetian domination since 1204. During the fifteenth and sixteenth centuries, Cretan Jews, in particular those of Candia, were part of a lively and learned community, as emerges from a number of manuscripts preserved in the Vatican Library (Cassuto 1935, pp. 29–44; 79–96) and from the *taqqanot*, i.e., the ordinances issued by the self-governed Jewish community (Artom and Cassuto 1943). Together with traditional subjects of the Jewish lore, Cretan Jewish intellectuals were well versed in philosophy and the sciences, as attested by the dissemination of numerous philosophical and scientific translations from Arabic into Hebrew, produced by enlightened circles of Provençal Jews during the thirteenth and fourteenth centuries (Steinschneider 1893; Licata 2013a, pp. 38–45). We also know that fierce conflicts originated because of the ideological differences between the followers of the Kabbalah and those of philosophy (Ravitzky 1999). This was the milieu where Delmedigo received his first education and probably began to be fascinated with Aristotle, as interpreted by the commentaries of Ibn Rushd, the Andalusian polymath known in the Latin Western world as Averroes (1126–1198). It is also here that Delmedigo may have developed his aversion for the Kabbalistic tradition exemplified by the book of *Zohar*.

The family of Delmedigo was among the wealthiest and most learned in Candia. Since Crete was a Venetian territory, it was not uncommon for these families to send their sons to Padua in order to study medicine or Jewish law. Delmedigo moved to Padua around 1480, if not before. He lived at least for 10 years in the Italian peninsula, mainly between Venice, Padua, Bassano del Grappa, Florence, and Perugia, working as a lecturer at the University of Padua and

introducing Averroes' interpretation of Aristotle to intellectuals such as Giovanni Pico della Mirandola (1463–1494) and Domenico Grimani (1461–1523). He played a role of primary importance in Renaissance culture as a mediator of Arabic philosophy, translating previously unknown commentaries by Averroes, and being the first among other Jewish translators of the Renaissance – like Abraham de Balmes (c. 1460–1523) and Jacob Mantino (d. 1549) – to begin “the second revelation of Averroes” to the Latin world (to use Harry Wolfson's words in his pioneering article “The Twice-Revealed Averroes”; see now Hasse 2016).

Between 1480 and 1482, Delmedigo lived in Padua, lecturing in an unofficial form – at the time, Jews were not allowed to teach at university, nor could they receive the doctorate degree. His profound knowledge of Averroes' commentaries, however, won the favor of scholars and students, for at the University of Padua, Averroes was still considered to be the most reliable interpreter of Aristotle's philosophy. The *Quaestio de efficientia mundi* (*Question on the Efficient Causality of the World*) and the *Quaestio de primo motore* (*Question on the First Mover*) constitute his first works, written at the request of the humanist Girolamo Donato (c. 1457–1511) (Licata 2013b, pp. 53–54). These metaphysical questions examine Averroes' position on divine causality and God's relation to the universe and show the extent to which Delmedigo relied on the commentaries and original treatises by Averroes.

Around 1481, Delmedigo met in Padua Giovanni Pico della Mirandola, who was there attending the university. Pico decided to hire Delmedigo as his teacher, translator, and Averroist interpreter of Aristotelian philosophy, for he was well aware that many works by Averroes were only preserved in medieval Hebrew translations unknown to his Christian contemporaries. These were the years when Pico was especially interested in the question concerning the conjunction of the potential intellect with the active intellect – a theme widely discussed by Averroes and other Arabic philosophers, like Avempace (Ibn Bājja,

c. 1085–1139). For this reason, Pico asked Delmedigo to clarify what the correct interpretation of Aristotle was on two crucial points: whether the human intellect is one, being shared by all human beings, or multiplied according to the number of the individual souls; and, secondly, whether a conjunction with the active intellect was possible. As a result, between December 1481 and January 1482, Delmedigo wrote two *Quaestiones de intellectu* (*Two Questions on the Intellect*), which soon after he translated into Hebrew with small additions concerning the relationship between philosophy and religion and some critical remarks on the Kabbalah. The two *quaestiones*, also known as *Two Investigations on the Nature of the Human Soul* in the Hebrew version, can be read as a compendium of the doctrine on the intellect and its cognitive activity along the lines of Averroes' interpretation, which postulated the existence of an eternal and transpersonal Intellect, shared by the human species as a whole (Engel 2017).

The intellectual collaboration between Pico and Elijah gave rise to a genuine friendship that lasted at least until 1486. At the beginning of 1482, Delmedigo moved to Venice from Padua, probably because of a conflict with the local community of Ashkenazi Jews, hostile to the study of philosophy – at that time the *yeshiva* (rabbinical school) was directed by the respected and orthodox rabbi Judah Minz (c. 1408–1508), with whom Delmedigo quarreled on legal issues. After he left Venice, Delmedigo lived in Florence with Pico in 1484–1485, a year that represents the peak of their collaboration. In Florence Delmedigo composed for Pico the *Annotationes in librum De phisico auditu*, i.e., a commentary on Averroes' Long Commentary – a “supercommentary,” to use Wolfson's expression – on Aristotle's *Physics*. He began his commentary on Averroes' *De substantia orbis* (*On the Substance of the Celestial Sphere*). He translated some logical investigations by Averroes on the *Prior Analytics* and the Paraphrase of Plato's *Republic*. During his stay in Florence, he was well integrated in the humanist circles: a letter by Marsilio Ficino (1433–1499) indicates that Delmedigo, who used to live in Pico's household, had some arguments with

Flavius Mithridates (alias of Guglielmo Raimondo Moncada, c. 1450–after 1491), a Jewish convert to Christianity, on the subject of whether or not the Jewish prophets had announced Jesus as the real Messiah. In the same period, i.e., May 1485, there was an exchange of letters between Ermolao Barbaro (1454–1493) and Delmedigo, in which the former harshly criticized the latter's worship of Averroes, and in particular some interpretation related to the doctrine of the syllogism (Licata 2013a, p. 68). As is shown by the preface of his commentary on *De substantia orbis*, Delmedigo was extremely critical of the fascination that several scholars in Florence had for the Platonic philosophy, esotericism, magic, and astrology. As he did with *Two Questions on the Intellect*, he translated from Latin into Hebrew his commentary on *De substantia orbis* in order to spread Averroes' point of view among contemporary Jews. This indeed was a challenging task, as Averroes' star was inexorably declining among fifteenth-century Jewish intellectuals, increasingly captivated by the Kabbalah and forms of Platonic mysticism. In September 1485, Delmedigo moved again to the Veneto region, living between Bassano and Padua, where he privately lectured on the *Prior Analytics*.

Delmedigo always strove to persuade Pico to become a leading light in Aristotelian philosophy (*magno in secta peripatetica*) (Licata 2017). His hopes, however, were gradually frustrated by Pico's fascination with the Kabbalah and the latter's friendship with Flavius Mithridates, who, around 1485–1486, taught him the rudiments of Hebrew and translated for him many Kabbalistic texts into Latin. Rather than being Pico's instructor in Hebrew – as has sometimes been claimed – Delmedigo confined his work exclusively to the translation and explanation of Averroes' philosophy. Nor was he willing to help Pico understand the principles of the comprehension of the Kabbalah, being aware that a Christian-oriented interpretation of the Kabbalistic texts could pose a serious threat to Jewish religion. From an important letter he addressed to Pico in Latin and in the Italian vernacular (Paris, BnF, ms. lat. 6508), we know that Delmedigo did not have a high opinion of Jewish mysticism in general (Licata 2017):

“As I see that you, my Lordship, are working hard on this bloody Kabbalah [*isto benedicto Chabala*], I would like to tell you something that I have already pointed out in my Hebrew commentary on *De substantia orbis*, when I was speaking about spiritual power, and which I never wanted to tell you. And what I will say is a highly concealed subject, and none of those who are dealing with it knows this. Actually, perhaps, few of the ancients knew it. And [what I am telling you] is little in quantity, but in quality is of the greatest worth.”

These introductory remarks betray Delmedigo's contempt for Jewish mysticism – the adjective *benedicto*, referred to Kabbalah, is used here as a rhetorical device to express his disregard for or annoyance at this type of doctrines. In describing the process of emanation of the Sephiroth from the *En Soph*, i.e., the Infinite, Delmedigo maintains that, according to the Kabbalah, the Sephiroth are responsible for the order of the universe: even though these entities are contingent in themselves, their necessity is due to the Infinite, which is unknowable in itself. And yet, in Delmedigo's opinion, the Kabbalists do not deserve attention, for they simply reproduce the doctrines of the Platonists without even knowing or acknowledging their debt, and these are views that are in sharp contrast with Averroes' interpretation of Aristotle. Although Delmedigo's attitude toward the Kabbalah seems sometimes ambivalent (as showed, not always convincingly, by Bland 1991), many passages of his works – especially in the *Behinat ha-Dat* (Licata 2013a, pp. 214–217) – clearly testify to a negative judgment concerning its theoretical foundations.

It is very likely that the last meeting between Pico and Delmedigo took place in the summer of 1486 in Perugia, where the two discussed metaphysical subjects, which Delmedigo partially collected in his short *Quaestio de esse et essentia et uno* (*Question on Being, Essence and the One*). At the end of November of the same year, Pico moved to Rome to publish his *Conclusiones non-gentae* (900 Conclusions). The book was intended as a programmatic introduction to the great intellectual conference which was to be held in Rome after the Epiphany of 1487. Pope Innocent VIII, however, prohibited the conference, and Pico was obliged to defend himself against accusations of

heresy. Meanwhile, Delmedigo went back to Padua and found a new patron, the humanist Domenico Grimani. With his assistance, some of his original works and Averroes' translations were published in 1488. Around 1489 he left the Venetian Republic and returned to Crete, where he spent the final years of his life. A few hypotheses were made on the reasons behind his departure – the conflicts with orthodox Jews of Padua or the ban proclaimed by the bishop Pietro Barozzi (1441–1507), who in 1489 forbade any public discussion of the Averroist doctrine of the unicity of the intellect – but there is no certainty. In 1490, probably at the request of his pupil Saul ha-Kohen Ashkenazi, he wrote in Hebrew the *Behinat ha-Dat* (*The Examination of Religion*), a treatise dealing with the question of the relationship between philosophy and religion. The work, published posthumously in 1629 by his relative Joseph Shlomo Delmedigo (1591–1655), became especially popular among Jewish intellectuals and scholars.

Philosophical Works: *Quaestiones* and Commentaries

During his stay in Italy, Delmedigo engaged in philosophical and exegetical investigations that bear no traces of biblical, Talmudic, and religious sources. This is an aspect worth emphasizing, as it marks a clear difference with respect to the majority of Jewish philosophers, who used to quote the Bible in support of their philosophical theses. This feature is strongly linked to Delmedigo's methodology, influenced by Averroes' position and by the tradition of Latin Averroism, according to which religious and theological doctrines, such as miracles, prophecy, and the afterlife, cannot be the subject of any rational inquiry.

Delmedigo's principal exegetical contributions are focused on psychology, natural philosophy, and cosmology. While the *Two Investigations on the Intellect* are devoted to the question of how one has to understand the relationship between the soul and the intellect, the *De efficientia mundi* and *De primo motore* – as well as his commentary on *De substantia orbis* and his *Annotationes in*

librum De phisico auditu – address key points in cosmology and divine causality. From these works it is clear that Delmedigo was a staunch defender of Averroes' positions in philosophy, including the more radical and controversial ones, such as: (1) the unicity of the intellect; (2) the eternity of the world (in the variant known as "eternal creation"), which entails the impossibility of miracles and divine providence toward individuals; and (3) the separation, or the autonomy, of philosophical investigation from the tenets of revealed religion.

- (1) The doctrine of the unicity of the (material) intellect was formulated by Averroes in his Long Commentary on *De anima*. Here he advanced the somehow paradoxical thesis that all humans share one and the same eternal intellect. Averroes thought that he could guarantee the objectivity of knowledge only by divesting the human soul of its character of individual substantiality. It is only by losing their personal identity that human beings could reach the truth: since only truth is eternal, only a portion of men – the intellective one – can live eternally. Averroes called this process "conjunction" with the separate and eternal active intellect. Although this view is contrary to a reductionist or materialistic approach, as both the material and the active intellects, for Averroes, are separate and independent of each single individual human being, Thomas Aquinas (1225–1274) perceived a danger in it, for Averroes' theory undermined the traditional doctrine of immortality that was taught by revealed religions. This is the background of Delmedigo's *Two Investigations*, where Delmedigo openly embraced Averroes' solution – as expressed in his Long Commentary – and defended it from the objections moved by Aquinas in his *De unitate intellectus contra Averroistas* (*On the Unity of the Intellect Against the Averroists*) (Engel 2017).
- (2) In the works dealing with physics and cosmology, Delmedigo championed the thesis of the eternity of the world. Although this view can be traced back to Aristotle (*Physics*, VIII),

it became particularly controversial during the Middle Ages when Averroes advocated it against the philosopher and theologian al-Ghazali (c. 1058–1111) in the *Tahafut al-Tahafut* (*The Incoherence of the Incoherence*). The *quaestiones De efficientia mundi* and *De primo motore*, in particular, explore the following dilemma: does the First Mover, that is, the Aristotelian God, move the celestial spheres only as a final cause (i.e., as an object of desire), or as an efficient cause, too, that is, as an Agent? Delmedigo embraced the hypothesis that God acted as both a final and efficient cause of the celestial movements. As such, God was not only the cause of their movement but, more significantly, the principle of their being and everlasting subsistence (Puig Montada 1998; Licata 2013b, c). In defending this idea, he was reconnecting to a distinctive interpretation of Aristotle, common among some Latin Aristotelians (Poppi 1966) and Jewish Averroists, who followed the authoritative response given by Averroes in *The Incoherence of the Incoherence* and in *De substantia orbis*. By attributing the power of efficient causality to the Prime Mover (a doctrine contrary to the letter of Aristotle's text), Delmedigo could avoid the charge of atheism that al-Ghazali had leveled against Aristotelian philosophers, since an inactive God, from a religious point of view, was perceived as a caricature of the living God of Abraham (Licata 2013b).

Among Delmedigo's works on physics, his commentary on *De substantia orbis* stands out as a particularly remarkable exegetical accomplishment. It doesn't come as a surprise that this treatise, together with the *Two Investigations*, are the only works that he decided to translate from Latin into Hebrew, as he thought that they could have an impact on philosophically minded Jews. Paradoxically, unlike his other philosophical works, they have not been published until now and are still in manuscript form (a critical edition of his commentary on *De substantia orbis* is under preparation by Michael Engel and Giovanni Licata).

The *De substantia orbis* is an original work by Averroes, no longer extant in Arabic, but preserved in Latin and Hebrew translations (the latter under the title *Ma'amar be-'Etzem ha-Galgal*). This work is a collection of *quaestiones* focused on the nature and properties of the celestial region. It also engages with metaphysical and cosmological topics, such as the incorruptibility and animation of the heavens, prime matter, the causality of the Prime Mover, and the physical influence of the celestial region on the earth. Aristotelian cosmology, which is the foundation of *De substantia orbis*, is based on a set of principles which shaped the global picture of the world for about two millennia. According to this view, our universe is composed of two regions, the celestial and the terrestrial, which are radically different in composition and which follow different physical laws. The celestial region, from the moon up to the sphere of the fixed stars, is composed of ether, an incorruptible substance naturally endowed with a permanent circular motion, while the terrestrial region is composed of the four elements and is subject to the processes of coming-to-be and passing-away. Aristotle, however, was not always consistent in his views, nor did he develop them in sufficient detail. For example, he did not mention whether the celestial region was composed of matter and form, like corporeal beings, nor did he explain how the immaterial Unmoved Mover was supposed to move the celestial spheres which were carrying the planets and the stars. In writing the *De substantia orbis*, Averroes drew especially on Aristotle's *Physics* and *De caelo*. His aim was to complete the philosopher's theory of the heavens and to defend it against Avicenna's far-fetched interpretation. The *De substantia orbis*, however, cannot be understood as an astronomical treatise in the technical sense, for it is concerned with the nature of the heavens in general rather than with the prediction and the determination of planetary and stellar positions.

Between the end of the fifteenth and throughout the sixteenth century, the *De substantia orbis* was commented on by many thinkers of the Italian Renaissance. This is evidence that the work was attracting increasing attention not only in Italian universities (Bologna, Padua, and Pavia) but also

in humanist circles, as is clearly shown by the commentary of Delmedigo. Unlike his Christian contemporaries, Delmedigo mastered both the Latin and Hebrew traditions of *De substantia orbis*, which is why Giovanni Pico asked him to write a commentary on the treatise. As we read in the preface, Delmedigo agreed because he considered Averroes' treatise to be a sort of compendium of Aristotelian natural philosophy. He wrote the commentary in Latin, but shortly afterward translated it into Hebrew for Jewish scholars interested in philosophy, adding some critical remarks on the Kabbalah. Luckily, both the Latin and the Hebrew versions survive in manuscript. The Latin manuscript, now in the Vatican Library (Vat. Lat. 4553), was copied under Delmedigo's supervision and includes some notes in Pico's own hand (Licata 2016; Murano 2019).

- (3) A common feature of Delmedigo's philosophical works is the formula, usually found in their opening or concluding sections, that when philosophy is at variance with religion (*lex*), he gives credit to the latter. Philosophy, however, ought to be distinguished from religion, for the "path" of the latter is different from the "path" of the former (*via legis alia est a via philosophica*) (Licata 2013a, p. 84). Indeed, it is not the philosopher's task to look for a possible harmonization between philosophical theses and religious tenets, especially when they seem to oppose each other, as is the case with the unicity of the intellect and the eternity of the world. This methodological approach – often used as a protective device to avoid religious persecution – was common among Aristotelian and Averroist philosophers, as Siger of Brabant (c. 1235–1284) and John of Jandun (c. 1285–1328), and is known through the historiographical label of the "double-truth theory." Historians have devoted many pages to Delmedigo in order to decide whether he supported or not this "theory" (Licata 2013a, pp. 194–208). This depends on the definition of double truth one intends to adopt: if there is double truth "when a thinker, after reaching a reasoned conclusion

in contradiction with faith, declares that he does not share this conclusion through a mere act of reverence and in absence of rational arguments against it" (according to Landucci 2006, pp. 141–142), then Delmedigo adopted a double-truth strategy. This is of particular importance for the interpretation of his *Behinat ha-Dat*, since a part of this treatise is thematically devoted to analyzing the relationship between philosophy and (Jewish) religion. And yet it should be noted that, although Delmedigo was not always coherent in his responses to this delicate problem (Engel 2016), he nevertheless remained faithful to the idea that "to a philosopher, there is only one true science and only one true way-of-life; the love of wisdom" (Motzkin 1987, p. 19).

Behinat Ha-Dat (The Examination of Religion)

This short treatise, written by Delmedigo in 1490 when he returned to Crete, is the only work devoted to the analysis of themes which traditionally belong to medieval Jewish philosophy. Delmedigo's general purpose was to highlight the principles of Jewish faith, defending the reasonableness of Rabbinic Judaism against its enemies, both internal (kabbalists and *mitpalsefim*, i.e., philosophizers) and external (Christian religion). At the same time, Delmedigo intended to justify the necessity of (Aristotelian) philosophy for the enlightened elite. The first part of the treatise deals with the question of the relationship between philosophy (or reason) and religion (or Torah), showing that, according to the Torah, the study of philosophy is necessary and praiseworthy for the enlightened few; common people must believe in simple principles of faith, without explanations or demonstrations of their truth, which, by contrast, is the duty of the philosopher. With other Jewish Averroists, Delmedigo conceives the Torah primarily as a book intended to educate the unlearned with rhetorical (not scientific) arguments. The strong influence of Averroes' *Fasl al-Maqal* (*Decisive Treatise*) is

evident in the *Behinat ha-Dat*, as Delmedigo reshaped many features of Averroes' theological-political thought according to the Jewish context (Licata 2013a, pp. 120–186). Delmedigo then acknowledged the contrast between few religious principles and (Aristotelian) philosophy, on such matters as prophecy, rewards and punishments, and miracles. He also maintained, however, that philosophy and religion were two distinct and independent areas within the domain of human knowledge, with their own specific source of legitimacy (reason and revelation).

In the second part of the *Behinat ha-Dat*, Delmedigo listed 11 fundamental principles of Judaism (such as, among others, existence, unity, and incorporeal nature of God; rewards and punishments; resurrection), according to his opinion, which was indeed influenced by Maimonides (1138–1204) and his 13 principles of faith. He then defended the legitimacy of Rabbinic Judaism and the Oral Law (Mishnah and Talmud). He then criticized the exegetical method of the Kabbalists and the philosophizers (*mitpalsefim*) influenced by Maimonides' philosophical allegorization of the Torah. He launched the first attack against the authorship of the *Zohar*, the most important book of the Kabbalah, arguing that it was a recent human creation influenced by some specific trends in the Platonic tradition, liable to be in conflict with traditional Judaism and therefore devoid of any authority. Finally, he examined the reasons behind the Jewish commandments (*ta'ame ha-mitzvot*).

It should also be said that the original composition of the *Behinat ha-Dat* contains here and there violent anti-Christian passages, arguing for the irrationality of Christian dogmas of the Trinity, incarnation, and transubstantiation. Although these passages are apologetic in tone, directed as they are to demonstrate that principles of Jewish religion are more rational than the Christian ones, they could also be related to Delmedigo's disappointment with the time he spent in Italy, when he was in touch with Christian humanists and intellectuals. These passages, however, when the *Behinat ha-Dat* was first published in 1629, were cut out. Thanks to the rediscovery of one uncensored manuscript, dating back to the

sixteenth century, the *Behinat ha-Dat* can now be read in its entirety (Ross 1984; Licata 2013a).

Significance and Legacy

As Delmedigo once wrote to his patron Giovanni Pico, he preferred by far explaining than translating Averroes' works (Licata 2013a, p. 83). In his interpretation of Averroes, he was influenced not only by former Jewish rationalists, or better Averroists, of the Middle Ages – such as Isaac Albalag, Moshe Narboni, Joseph ibn Kaspi, and Isaac Pulgar (Licata 2016) – but also by the general climate of Paduan Aristotelianism and Averroism (Engel 2017). This is quite unique in the panorama of Renaissance Averroism, for Delmedigo had access to key texts by Averroes preserved in both Hebrew and Latin translations and was therefore able to merge two distinct and parallel Averroist traditions, the Jewish and the Latin one. Although he respected Maimonides, he rarely mentioned him in his philosophical works, and in the *Behinat ha-Dat* he openly criticized him for his philosophical interpretation of the Torah in the *Moreh Nevukhim* (*The Guide of the Perplexed*). For these reasons, to view Delmedigo as a Maimonidean, as some interpreters have done, is too narrow a view. He was – and saw himself as – an Averroist, committed to defending the Commentator from the criticisms made by Christian philosophers, such as Thomists and followers of the Platonic tradition (Engel 2013). He often attacked and derided philosophers that he regarded as half-baked thinkers, referring to them with the derogatory term *mitpalsefim* or *philosophantes*.

His original works and translations heavily influenced Pico's *900 Conclusions* – in particular those concerning Arabic philosophy (Fellina 2017). His *Two Questions on the Intellect*, which may be read as a supercommentary on Averroes' Long Commentary on the third book of *De anima* (Engel 2017, p. 26), his questions dealing with matters of physics and cosmology, and his commentary on *De substantia orbis*, as they were originally composed for a Latin audience, might also have influenced some Paduan Aristotelians,

such as Agostino Nifo and Pietro Pomponazzi (Poppi 1966; Engel 2015). Both, for example, wrote a commentary on *De substantia orbis* at the beginning of the sixteenth century.

In Jewish culture, Delmedigo began to be appreciated only in the nineteenth century, when, as a result of the rise of the Jewish Enlightenment (Haskalah), his criticism of the Kabbalah was seen as an important accomplishment. This was the main reason behind the reprinting of the *Behinat ha-Dat* by the Italian scholar Isaac Samuel Reggio in 1833 (Licata 2013a, pp. 103–110). It is however worth pointing out here that Spinoza owned the first edition of the *Behinat ha-Dat* (1629) and that this text had certainly some influence on the composition of the *Theological-Political Treatise* – a milestone of the European Enlightenment – especially with respect to a few theses characteristic of the Averroistic tradition, among which the central assumption that philosophical and scientific investigations should be independent from any intrusion of a religious or dogmatic kind (Fraenkel 2013; Licata 2013a, pp. 245–285).

Works

- *Quaestio de efficientia mundi* (1480). First printed in Venice in 1488, together with other Latin works, in an incunabulum containing works by John of Jandun (*Quaestiones in libros physicorum Aristotelis*) and reprinted many times during the sixteenth century. A critical edition is now in Licata 2013c.
- *Quaestio de primo motore* (1480–1481). First printed in Venice in 1488 and many times during the sixteenth century. See John of Jandun 1969.
- *Quaestiones de intellectu* (1481–1482) or, according to the Hebrew version, *Two Investigations on the Nature of the Human Soul*. The Latin version, dedicated to Pico, appears to be lost. The Hebrew version by the author himself, extant in two complete manuscripts, is still unpublished (Paris, BnF, ms. hébr. 968; Milano, Biblioteca Ambrosiana, X 128 sup.). A detailed study can be found in Engel 2017.

- *Annotationes in librum De phisico auditu super quibusdam dictis Commentatoris* (1485). Written upon Pico's request in Florence, it was printed in Venice in 1488 and reprinted many times during the sixteenth century. See John of Jandun [1969](#).
- *Expositio super librum Averrois De substantia orbis* (1485–1486). Still unpublished, it is preserved both in the Latin version, written for Pico, and in the Hebrew version, translated by the author himself (Vatican city, BAV, Vat. lat. 4553; Paris, BnF, ms. hébr. 968).
- *Quaestio de esse et essentia et uno* (1486). First printed in Venice in 1488 and many times during the sixteenth century. See John of Jandun [1969](#).
- *Behinat ha-Dat*. Written in 1490 in Crete. First published in 1629. Critical edition in Ross [1984](#) and Licata [2013a](#) (the latter with Italian translation). English translation in Geffen [1970](#); the 1992 French translation by Maurice-Ruben Hayoun is not always reliable.
- Compendium of Aristotle's *Meteorology*, Venice 1488.
- Middle Commentary on Aristotle's *Meteorology* (partial), Venice 1488.
- *Proemium* to Book XII of Aristotle's *Metaphysics*, Venice 1488.
- Long Commentary on Aristotle's *Metaphysics* (Books I–VII), Venice 1560. Sometimes mistaken for the Middle Commentary, as it was published under this title.
- *Quaestio in librum Priorum*, Venice 1497.
- *De spermate*, Venice 1560.
- Paraphrase (Middle Commentary) of Plato's *Republic*. See Averroë [1992](#).
- Compendium of Aristotle's *De anima* (partial).
- Paraphrase (Middle Commentary) of Aristotle's *On the Parts of Animals*.

Letters

- Ermolao Barbaro to Delmedigo, 4 May 1485 (in Barbaro [1943](#), pp. 87–90).
- Delmedigo to Giovanni Pico, *De nervis et sensu tactus*, 1485/6 (in Licata [2014](#)).
- Delmedigo to Giovanni Pico, between October 1485 and April 1486 (according to Busi [2008](#)). The letter was only partially edited by Jules Dukas and Eugenio Garin and was then published in its entirety in Kieszkowski [1964](#). This transcription, however, is marred by several mistakes. A new emended edition, updated according to recent research, is in Licata [2017](#) (but see also Licata [2019](#)).
- Delmedigo to Domenico Grimani, c. 1487 (in Kieszkowski [1964](#)).

Hebrew into Latin Translations of Averroes

Delmedigo's translations mark the beginning of a more detailed knowledge of Averroes in the Renaissance. Although only his translation of the Compendium of Aristotle's *Meteorology* was included in the famous Giuntine edition of Aristotle and Averroes (*Aristotelis omnia quae extant Opera... Averrois Cordubensis in ea opera omnes, qui ad haec usque tempora pervenere, commentarij*, Venetiis apud Iunctas, 1550–52; reprint 1562–74), it is nevertheless likely that some of Averroes' works which appear in the Giuntine edition were retranslated by other Jewish translators (e.g., Abraham de Balmes, Jacob Mantino) taking into account Delmedigo's earlier version (Steinschneider [1893](#); Di Donato [2013](#)). In some cases, a faithful manuscript copy with Pico's marginal notes is still preserved. Detailed bibliographical information can be found in Bartola ([1993](#)), Licata ([2013a](#), pp. 93–98), and Murano ([2019](#)):

Denores, Giason

Born: ca 1510/1530 (?), Nicosia, Cyprus

Died: 1590, Padua, Italy

Eleni Lampaki
Athens, Greece

Abstract

Giason Denores was a Cypriot scholar who lived and taught in Italy. He wrote on various subjects ranging from cosmography to civil philosophy, although he was mainly concerned with rhetoric and poetry and their relation to ethics. He is mostly remembered for his philosophical quarrel with Giovanni Battista Guarini

over the literary genre of pastoral tragicomedy, represented by Guarini's *Pastor Fido*.

Biography

Giason Denores was born in Nicosia, Cyprus. His father, Peter, belonged to a powerful and noble family originating probably from Normandy, whose presence in Cyprus is attested already during the thirteenth century. Many members of the Denores family, as well as from his mother's side, held important posts for the Venetian Republic. His date of birth is uncertain. His older biographers placed his birth ca 1530 (Budd 1927; Patrizi 1990), although according to more recent evidence, he must have been born significantly earlier, around 1510 (Panagiotakis 1985; Gialama and Kaklamanis 2000).

Denores studied in Padua, probably after 1530; some of his notable teachers were Trifone Gabriele and Sperone Speroni. A manuscript dated at 1539 (Palatinus 260) contains some of his first pieces of work, epigrams and short poems written in Greek and Latin (his only works in Greek) and some speeches. After the end of his studies, he probably returned to Cyprus; the exact dates are not known. At some point before 1553, he traveled to Venice, where he printed his first book: a commentary of Horace's *Ars Poetica*, based on the lectures of Trifone Gabriele. At the same period, he became a member of *Academia Pellegrina*. Afterward, he returned back to Cyprus where he probably remained till the Turkish invasion of 1570. In Cyprus he got married to Aikaterini Sygklitikou, who came from a noble Cypriot family; they had three children. There are no news of his literary or other activities in Cyprus, although it is probably that he held some important posts (Gialama and Kaklamanis 2000).

After the Turkish invasion, Denores family fled to Venice, where he was occupied as tutor to children of noble Venetian families. After many requests, his family was given estates in Crete, and his brother moved to live there, although Giason remained in Venice. His second book, a treatise on cosmography (*Breve trattato del*

mondo, et delle sue parti) appeared in Venice in 1571.

In 1573 he is found in Padua, where he received a position as reader in rhetoric at the newly founded Accademia dei Rinascenti. His third book is related to his activities in the academy: a study on rhetoric, in two parts, published in 1574 and dedicated to the academy (*Breve trattato dell'oratore* and *Discorso intorno alla rhetorica*). In 1577 he was chosen among the Cypriot refugees in Venice to address the new doge Sebastiano Venier, in order to ask for protection, help, and employment for the members of the expatriate Cypriot community. His address was successful, and the Cypriots were granted permission to settle in the city of Pula; Denores himself had been offered the Chair of Moral Philosophy at the University of Padua, which had been vacant for 10 years since the death of his predecessor, Francisco Robortello. The years after this appointment, till his death in 1590, were the most productive: 13 of his books were published between 1578 and 1590.

His books covered many fields, from cosmography and politics to rhetoric and poetic art, and were deeply rooted in the Aristotelian tradition. His most discussed works were his books on poetics, because they involved him in a literary quarrel with Giovanni Battista Guarini over the validity of the new genre of tragicomedy. His other works include an introduction on rhetoric, based on Aristotle (*Introduttione ... sopra i tre libri della Rhetorica di Aristotele*), printed in 1578 in Padua, a political treatise based on Aristotle (*Breve institutione dell'ottima repubblica*), printed in Venice in 1578, a commentary on Cicero (Padua 1581), and cosmographic and geographical studies (*Tavole ... del mondo et della sphaera, Discorso intorno alla geographia*). His theoretical views on rhetoric and poetry are mainly elaborated in his rhetoric (*Della rhetorica*, printed in 1584 in Venice) and his poetic (*Poetica* 1588). Some of his speeches and lectures have also been published, while works in manuscript can be found in many Italian libraries.

His work (*Discorso... intorno a' que' principii, cause, et accrescimenti, che la comedia,*

la tragedia, et il poema heroico ricevono dalla philosophia morale), published in 1586, where he criticized pastoral tragicomedy, triggered a response by Giovanni Battista Guarini, the author of *Pastor Fido*, which had started to circulate in manuscripts around that time. Guarini, although his name and his work were not at all mentioned in *Discorso*, published in 1588 a critique on Denores' work, with the title *Il Verrato*, where he aimed to refute the arguments against tragicomedy, attacking personally the author of *Discorso* as well. Denores published his answer in 1590, *Apologia contra l'auttor del Verrato*. This book gives important autobiographical information, as Denores felt insulted from Guarini's dismissive remarks on his personality. Guarini's response was published 3 years later, although Denores was already dead.

Denores died in Padua in 1590. The last years of his life were affected by the quarrel with Guarini, as well as unfortunate family circumstances: his son Peter had been convicted of killing a Venetian nobleman in a duel.

Heritage and Rupture with the Tradition

The general idea which guided Denores' poetic theory was the Counter-Reformation doctrine that the aesthetic function of literature cannot be separated from the utilitarian one. Literary critics of this period, such as Julius Scaliger and Antonio Minturno, stressed the moral utility of literature. D.'s views on the moral function of poetry are deeply rooted in this tradition. He expanded Varchi's statement that literature should serve not only religion but the state as well. The genres that can perform these functions are tragedy, comedy, and the epic, and these are the only genres presented in his poetics.

Denores excludes the possibility of a happy ending in tragedies, because a change of fortune from misery to happiness will not evoke the emotions of pity and terror which lead to catharsis. In this aspect, he differs from Scaliger, Castelvetro, and Giraldi. In his treatment of tragedy, he strictly follows Aristotle, and for that reason, he does not deal with contemporary questions such as the use

of historical themes or the unity of place, formulated by Castelvetro.

Catharsis according to Denores is assigned a moral and political function: “to make [the spectators] detest the life of tyrants and of the most powerful”. The means to achieve it are the sentiments of terror and pity. The heroic poem, on the other hand, does not purge the passions but “instills virtue into the minds of the listeners”, while comedy purges “those torments which disturb our quiet and tranquility, such as the ‘amours’ of wives and daughters” (Budd 1927). Denores insists on the political function of poetry and links each genre with a political message: comedy makes spectators to desire the life of private citizens; tragedy teaches them to abhor tyrants and the epic makes them to desire a good prince. On the contrary, pastoral poetry did not have any utility for civic life; moreover, it could promote the idea of leaving the cities and preferring the countryside.

Under this light, Denores’ rejection of pastoral tragicomedy can be explained: this new genre is not only devoid of any moral function, but is a mixed genre as well. His criticism is based upon issues which were very important for Renaissance literary theory, such as the edifying function of literature, the mixtures of genres, and the role of Aristotle’s *Poetics* as a set of rules which are to be followed strictly. Denores was not the only one to criticize *Il Pastor Fido*, and Guarini was not the only one to defend it.

Denores’ political interests are found not only in his poetics, but in his rhetoric treatises as well, where he insists on the importance of oratory skills to civic life and to good governance. His moral and political interests are also shown in other works, as the *Breve institutione de l’ottima republica*, the commentary on Cicero’s philosophy, and his panegyric on the Republic of Venice.

Impact and Legacy

Denores is mainly known for taking part in the controversy surrounding Guarini’s *Pastor Fido*. His life and works have remained mostly unstudied till the last decades, and, as one of the few

researches who have studied their work wrote, “he has been treated with a neglect that is by no means wholly deserved” (Budd 1927).

During his lifetime he was held with respect not only among the members of the Cypriot community in Venice, who chose him to address the doge for help, but also among aristocratic and literate circles in Venice and Padua, as one can assume judging from the teaching posts he held and his relation to important Academies. According to the information he gives in his *Apologia* (p. 329); the King Sigismund invited him to teach in Poland. However, only the first of his books was reprinted during his lifetime.

Descartes, René

Born: 31 March 1596 (La Haye en Touraine, France)

Died: 11 February 1650 (Stockholm, Sweden)

Fabrizio Baldassarri

ICUB-Humanities, University of Bucharest,
Bucharest, Romania

Abstract

Scholars generally consider René Descartes to be the father of early modern philosophy insofar he rejected scholasticism, Aristotelianism, but also Renaissance philosophies and grounded a new system of knowledge whose roots lie solely in the mind and not in previous assumptions. This defines a modern self that achieves the knowledge of nature and shapes the modern universe. In the *Discours de la Méthode* (1637) and the *Meditationes de prima philosophia* (1641), after rejecting earlier education, doctrines, and *scientiae*, Descartes isolates the powers of the mind (i.e., clear and distinct ideas) as the beginning of any certainty. Yet, having considered Descartes' system as dismissing all doctrines and

beliefs, in this entry I will first examine some relations between the French philosopher and those contexts and then discuss the novelties of his system. After a short biography, in the second section, I will briefly explore the interrelations between Descartes and Renaissance scholars, whom he reproached for their precipitate conclusions. Third, I will unearth his criticism of Aristotelian-scholastic philosophy (which he reproached for its preconceptions), while highlighting his attention to a few Aristotelian texts. Fourth, I will investigate a few innovative aspects of his methodology; this consists of novel combination of intellectual cognition and experimentation. As a result, Descartes' entire natural philosophy consists of a theoretical framework that defines the principles of knowledge and the architecture of science, while the body of all disciplines and the knowledge of particular issues are methodologically and experientially constructed. Despite several limitations, Descartes' system is remarkably innovative.

Biography

René Descartes was born in La Haye en Touraine, today named Descartes, on March 31, 1596. (For a fascinating biographical reconstruction, see van Ruler 2019.) His father was Joachim Descartes and his mother Jeanne Brochard, and he was born into a bourgeois legal family that served the French crown. Both his grandfathers were physicians and had associations within a cultivated environment that likely influenced the early life of René (Rodis-Lewis 1971; Aucante 2006; Baldassarri 2014; Meschini 2013). Later on, Descartes enrolled at the Collège of La Flèche (probably between 1606 and 1614, but the exact dates are uncertain), where he followed the traditional *cursus studiorum* and was raised reading the classics, disputing and debating, exploring obscure and false subjects, and generally referring to a traditional system of knowledge. Yet, Descartes grew consistently critical of the schooling he received, as he famously writes in the first part of the *Discours de la Méthode*: “as soon as I had

completed the course of study at the end of which one is normally admitted to the ranks of the learned, I completely changed my opinion. I found myself beset by so many doubts and errors that I came to think I had gained nothing from my attempts to become educated but increasing recognition of my ignorance” (Descartes AT VI 4–5; CSM I 113). While the rule of professors was not to depart from Aristotle, Descartes experienced the need for both a different ground for knowledge and a different theoretical framework: indeed, he writes he “entirely abandoned the study of letters. Resolving to seek no knowledge other than that which could be found in [him]self”, because he claimed there is “much more truth [...] in the reasoning which a man makes concerning matters that regard him than in those which some scholar makes in his study about speculative matters” (Descartes AT VI 9–10; CSM I 115).

Once he left school, and after taking the *Baccalauréat* and *Licence* in law at the University of Poitiers, Descartes enrolled as a volunteer in the army of Maurice of Nassau (1567–1625). In Breda, he met Isaac Beeckman (1588–1637), a chance encounter that changed his life (Richard 2007; van Berkel 2013). He spent a few months working with Beeckman on mathematics and music, whose results are collected in a *Compendium of Music* (1618) and in some notes on mathematics contained in Descartes' manuscripts and in Beeckman's *Journal* (on Descartes and music see Fabbri 2008, de Buzon 2019). Afterward, he traveled to Denmark, Germany, Austria, Bohemia, and Italy.

What triggered Descartes' *grand tour* was the possibility to visiting courts, gathering experiences, and visiting people of different knowledge and sorts, as he later suggests in the *Discours*. Indeed, he visited Prague, certainly an important cultural center at the time, and planned to go to Rome, although he probably never descended beyond Northern Italy (Mehl 2019). Apparently, during these years he found time to define the grounds for a philosophical program to construct a new science (although the premise for this occurred while he was dreaming), which he intended to adhere to when he returned to Paris. Yet, the Parisian years (1624–1628) appear to have

been less productive for Descartes, who joined Marin Mersenne's (1588–1648) circle in Paris but found little time to achieve his project. What Descartes actually did in Paris is, regrettably, difficult to say. Apparently, he began to work on different treatises, developing parts of his algebra and geometry, a study of optics, and possibly an epistemological treatise (which later develops into the *Regulae ad directionem ingenii*, posthumously published in 1701). While this appears to be a period of leisure and idleness, things thereafter change quite rapidly. Somehow in consequence of a meeting in which Nicolas de Villiers, sieur de Chandoux (?–1631) presented his alchemical studies of nature (Matton 2013; Joly 2013), Descartes figured out the importance of bringing his treatises to completion (Clarke 2006, 81), and he moved to the United Provinces in order to achieve this (Verbeek 2015).

In the Netherlands, Descartes slightly changed and broadened his focus. Several events played a role in this. The first is his rupture with Beeckman in October 1630, the consequence of which consists of Descartes' departure from a physico-mathematical method toward a more general and theoretical one. The second is his matriculation at the University of Franeker in 1629 and at Leiden University in June 1630, where he developed medical interests (in anatomy, physiology, and therapeutics), although he never graduated. The third is his interest in experimentation and big pictures. In 1629, for example, he testified to this change to Mersenne claiming that, moving from a single phenomenon, the *parhelio*, he intends to develop a “systematic study of the whole of meteorology” that contains “all sublunary phenomena” (Descartes AT I 23; CSMK 6, which later became *Les Météores*, 1637). Furthermore, several collaborations with Dutch scholars such as Henricus Renieri (1593–1639), Vopiscus Fortunatus Plempius (or Plemp, 1601–1671), and Constantijn Huygens (1596–1687), among others, importantly helped Descartes shape his philosophical and experimental knowledge of nature (Buning 2013; Baldassarri forthcoming).

As a result of his early years in the Netherlands, he planned a whole physics, posthumously published as *Le Monde* in 1664, which, though,

he abandoned in 1633. This is a rather innovative text in which he rejected traditional forms, defined nature as extended matter, and grounded physical knowledge in three mechanical laws of motion. Along these lines, the last chapter of this text was supposed to deal with a few living functions of the human body, namely, sensation, memory, and imagination in a mechanical way, and composed a text later detached from *Le Monde* and published on its own in 1662 and in 1664 as *L'Homme* (Antoine-Mahut 2016; Alban-Zapata 2016). Apparently, the reason for refraining from publishing this work lies in the 1633 condemnation of Galileo by the Inquisition in Rome. Descartes would have imagined that a physics grounded in reason alone, as it is in *Le Monde*, would have encountered a similar negative reception.

A few years later, Descartes reluctantly acquiesced in the insistence of his friends and prepared for publication three essays, *La Dioptrique*, *Les Météores*, and *La Géométrie* (1637). Stripped of a general framework, such specific studies would have not been confronted with the antagonism of the Church. Still, he prefaced these essays with a short, but meaningful, introduction, the *Discours de la Méthode*, in which, after a short biographical reconstruction, Descartes presented in French a few epistemological rules (Part 2), elaborated a metaphysics (Part 4), and introduced his previous scientific work (Part 5). He concluded his text with a section on the importance of achieving knowledge through combining theory with experimentation (Part 6) (Gadoffre 1987; Bos and Verbeek 2013). This text is revolutionary.

First, Descartes rejects the traditional system of knowledge. Second, he introduces a simple methodology that anyone could understand and make fruitful (and which could have been devised by anyone without a specific knowledge of traditional philosophy, such as artisans and craftsmen, see Descartes AT VI 11–12). Third, he situates himself in a Baconian perspective, developing a practical philosophy that can be used to make one master of nature and contribute to the knowledge of general physics, of all natural phenomena (such as of the rainbow, for example), but especially for “the maintenance of health” (Descartes AT VI 63; CSM I 143). Against the traditional system,

Descartes reveals an alternative program based on the evidence of the mind, in which the rules of a mechanical physics would help him coherently explain nature and living bodies, as the case of the heartbeat supposedly reveals. Yet, no revolution immediately followed from the reception of the *Discours* (Garber 1988).

While his project to publish a second edition of the *Discours* together with a section of objections and answers (some of which are however contained in the correspondence) floundered, Descartes decided to establish a first philosophy in Latin as a metaphysical ground for any knowledge of nature. Doubts about all knowledge and experience and even the hyperbolic and universal doubt about the nature of God led the meditator to a metaphysical ground: the *ego cogito, ego sum* (I think, therefore I am), and the infinity of God (Scribano 1997; Agostini 2019; Nolan 2019). The result is the *Meditationes de prima philosophia*, published with a long appendix of seven objections (raised by scholars such as Pierre Gassendi, Antoine Arnauld, and Thomas Hobbes) and Descartes' replies to each of them.

The consequence was twofold. On the one hand, a fierce opposition developed to his rationalistic framework (such as in the Utrecht crisis, Verbeek 1988); on the other, Descartes grounded an entire program of physics on his metaphysical system (Garber 1992), discovering a new force for the knowledge of nature. In the first part of the *Principia philosophiae* (1644), Descartes deals with the metaphysical principles of knowledge, in the second with the physical principles, in the third with the universe, and in the fourth with terrestrial bodies. Established through a mechanical physics and through a few laws of motion, Descartes devises an indefinite universe and a world composed of extended matter. He was therefore able to describe minerals, stones, and the magnet. Still, when he came to describe living bodies, namely, animals and plants, and the human beings, he faced unsurmountable difficulties that made impossible to bring his natural philosophy to completion. In 1647–1648, however, Descartes claimed to be working on the animal body, and especially on embryology, and writing a text today known as

La Description du corps humain (posthumously published in 1664), and in 1649 he published a treatise on human passions, *Les Passions de l'âme*, on the connection between the mind and the body (Kambouchner 2019). In both these texts, Descartes' attention to medicine, physiology, and anatomy surfaces as the tip of an iceberg that composes one fifth of Descartes' texts. Indeed, medicine was one of the most important enterprises in which Descartes was interested, as he anatomized bodies, developed an important physiological system, and elaborated a therapeutics grounded on his mechanical understanding of the living body, the famous theory of the animal machine (Bitbol-Hespériès 2000; Aucante 2006; Manning 2013; Baldassarri 2018, forthcoming). Finally, tired of fighting the philosophers, Descartes moved to serve at the court of Maria Christina of Sweden in Stockholm, where he died in February 1650.

What is interesting to note is that Descartes' thought received huge and various attention from both followers who intended to bring his project to completion, such as Henricus Regius (or Hendrick de Roy, 1598–1679) and opponents on various sides (Bos 2002; van Ruler 1996). Without any doubt, Descartes' philosophy sparked enormous discussion throughout the seventeenth and eighteenth centuries, playing a major role in shaping the early modern period (Nadler et al. 2019).

Descartes and the Renaissance: Precipitate Conclusions

In his famous letter to Beeckman, Descartes stresses that along with Plato, Aristotle, and Epicurus “Telesio, Campanella, Bruno, Basson, Vanini, and *Novatores* all say something different,” (Descartes AT I 158; CSMK 27) but who has got anything to teach him? In his denunciation of authority, Descartes thus gathers together Ancient philosophers and *novatores* as heralds of incorrect systems of knowledge, in which correct opinions have been deduced from false principles. (I will not investigate all possible relationship between Descartes and such *novatores*, see the articles in

the volume edited by Faye (1999b).) Drawing knowledge from their systems is useless, if you are not merely reconstructing a history of philosophy. Yet, while he allows a position to Plato, Aristotle, and Epicurus in the history of philosophy he reconstructs in the *Lettre-Préface* (1647; Descartes AT IX-2 6–9), no room is given to *novatores* at this stage. In this section, while discussing the Cartesian evaluation of a few scholars from Renaissance period, I unearth his judgment on the systems of knowledge tied to the Renaissance culture as precipitous and lacking solid principles.

The most relevant case is Tommaso Campanella (1568–1639). On March 1638, Descartes thanks Huygens who had sent him a new edition of *De sensu rerum et magia*, a text he had known since 1623. Yet, he found nothing but “little substance in his writings” as “to go astray through fondness for the most out-of-the-way paths is less excusable than to follow the well-trodden ones” (Descartes AT I 659–660; CSMK 91). In Cartesian terms, this is a methodological reproach. A similar (but anonymous) criticism surfaces in Rule 4 of the *Regulæ*, where Descartes writes that “so blind is the curiosity with which mortals are possessed that they often direct their minds down untrodden paths, in the groundless hope that they will chance upon what they are seeking” (Descartes AT X 371; CSM I 15). Apparently, this blind desire especially affects scholars whose keenness to discover new things makes them desperate and impulsive, while proceeding “in a forest” ought to be done in the light of method. Precipitation appears to be the error leading all *novatores*, not just Campanella, insofar as they ground their philosophy in insubstantial principles and look for the truth inconsistently. As Descartes claims in Rule 3, in *vulgaris philosophia*, scholars have moved away from acknowledging what is clear and certain and “on the basis of merely probable knowledge [have] venture[d] to make assertions on obscure matters about which nothing is known [. . .]. The result is that the only conclusions they can draw are ones which apparently rest on some such obscure propositions, and which are accordingly uncertain” (Descartes AT X 368; CSM I 14).

Similarly, Descartes claims that the system of neither Lull nor Agrippa is “supplied [with] certain keys which are [. . .] essential for revealing the secrets of the method” (Descartes AT X 165; CSMK 5) or, at least, the proponents of these theories ignore the principles, which appear to be useless in inferring true knowledge. And Lull’s arguments are mere “sophistries” (Descartes AT II 629; CSMK 142).

In more solid disciplines, Renaissance scholars generally stop their chain of reasoning at a determinate point and without including all possibilities. This is the case Descartes suggests in *La Géométrie*, where he claims that the formula Girolamo Cardano (1501–1576) acknowledged to solve cubic equations (discovered by Scipione dal Ferro) fails to include all equations and therefore is not as general as it could be (Descartes AT VI 474). Something similar occurs to alchemists, as alchemical theory lacks solid principles: the three elements (*tria prima*) of alchemy are not the first elements to which natural bodies should be reduced (Joly 2013; Baldassarri 2015), while in the end nature is nothing but extended matter deprived of all other qualities.

A not wholly dissimilar case is that of Niccolò Machiavelli (1469–1527). In his exchange with Princess Elisabeth of Bohemia (1618–1680), in commenting on *The Prince* (1512), Descartes claims that on Machiavelli’s “foundations, he rests some very tyrannical precepts” (Descartes AT IV 487; Shapiro 2007, 140). Descartes stresses that “thinking that a good man is he who does everything true reason tells him to, it is certain that the best thing is always to try to be one” (Descartes AT IV 490; Shapiro 2007, 142). Against the incorrect principles of Machiavelli, one should ground politics in the order of reason (Baldassarri 2014).

In the end, these examples reveal Descartes familiarity with several theories tied to Renaissance culture, which he generally lumps together as precipitous systems that lack solid principles (for a different view, see Faye 1999a, b, 2016). Accordingly, these theories incorrectly infer knowledge across the various disciplines, from logic and physics to chemistry and politics.

Descartes and the Aristotelians: Preconceptions

Against the Ancients, Descartes was even harsher. In a juvenile text, today collected as an appendix to the *Studium bonae mentis*, Descartes wrote that “we shall not confer much [authority] to the ancients due to their antiquity, as we ourselves are more ancient than them. Today the world is older than at their time, and we have more experience about things” and then “may the gods ruin the Ancients, and save my things [*Dii male perdant Antiquos, mea qui praeipueri mihi*]” (Descartes AT X 204; cf. Gouhier 1979, 142–149). In this rewriting of the traditional claim of dwarfs standing on the shoulders of giants, Descartes reveals how fiercely he contested any acquired system of knowledge and how much he looked forward to making his own discoveries.

Yet, Descartes developed two ways to deal with the Ancients. The first is to consider them as pundits, whose system taught in the schools fails to lead to truth or discoveries but just helps repeat acquired assumptions. In the previously mentioned letter to Beeckman, for example, Descartes defies any claim that knowledge derives from pre-assumptions authoritatively established, as this leads to error. For example, the training in the schools, grounded as it is on syllogism, makes scholars strive for victory in disputes, as partisans or advocates able to establish plausibility (i.e., the internal coherence of an argument) rather than being judges able to weigh reasons or knowledge, failing to deal with truth or to discover a new one (Descartes AT VI 69; CSM I 146). Without any effort, “they are like ivy, which never seeks to climb higher than the trees which support it” (Descartes AT VI 70; CSM I 147). Additionally, through controversies they “are inclined to employ the most subtle arguments” and they generally wrap up them in “various obscurities” (Descartes AT X 366–367; CSM I 13) that leads to blindness, departing from the evidence or the light of the mind. One example is the notion of substantial form, to which Descartes opposed a mechanical system (Hattab 2009).

According to Descartes, the scholastic system is built on erroneous principles. In his

exchange with Plemp, there is a clear example of this error. Against Plemp’s claim that the fermentation of blood is already given in Aristotle, Descartes replies that Aristotelian theory is erroneous since it was grounded on Aristotle’s ignorance of the true cause of blood fermentation, namely, the natural heat of the heart (Descartes AT I 522; cf. Descartes AT XI 245, CSM I 319). Indeed the error of Aristotelian scholars consists of grounding their knowledge in incorrect principles. Moreover, the followers of Aristotle had corrupted his writings insofar as they attribute to him opinions he would not recognize as his own (Descartes AT IX2 7; CSM I 182), therefore revealing how far from preconceptions and false knowledge, taking diverse shapes form, may be developed from incorrect principles.

Besides this methodological line, Descartes also deals more directly with Aristotle’s and Aristotelian philosophy and texts. Contemporary scholars have commented on the shades of Aristotle in Cartesian texts such as the *Regulae* (Marion 1975) or the *Essais* (Belgioioso 1990) or highlighted the direct relations with scholastic traditions (Gilson 1913; Ariew 2019; Agostini et al. forthcoming). It is true that Descartes used the texts of Aristotelian scholars such as Aquinas’ *Summa theologiae* to carve out his own thoughts and accommodate them to the reader, something he especially did when he intended to defend his philosophy from scholastic readers (Descartes AT I 366–367, 376, AT II 435, AT III 185, AT IV 117; Agostini 2010; Baldassarri 2016). Among others, he consulted the Conimbricenses, Abra de Raconis’ *Totius philosophiae*, and Eustache de Saint Paul’s *Summa philosophica quadripartita* and was likely aware of Francisco Suarez’s work, acknowledging that these texts had a role in unveiling the order of reason of his own philosophy. In other words, when stripped of their false principles and preconceptions, even scholastic texts (or, at least, some of them, what he called *libri primarii*) have a utility insofar as a chain of reasoning arises in them. These texts help in shaping the order of knowledge. And Descartes did not shrink textual confrontation with Aristotelianism as a way of disseminating his own philosophy and

communicating it in a way that is adequate for other scholars.

Descartes' Program for Combining Reason and Experience

Free of any preconceptions and precipitate conclusions (the errors investigated in the previous sections), anyone may achieve *scientia*, or true knowledge, by means of clear and distinct ideas and intellectual evidence (Descartes AT VI 18; CSM I 120). Accordingly, science is certain and evident cognition achieved by the mind (Descartes AT X 362; CSM I 10), that is, by the means of the intellectual operations, these being deduction and intuition. In the *Regulæ*, Descartes suggests that the intellect alone is capable of scientific cognition, while he rejects the Aristotelian claim that knowledge is in the senses before it reaches the intellect. Still, even in the epistemology of the *Regulæ*, Descartes does not reject experimentation as such, but acknowledges “two paths of arriving at a knowledge of things – through experience and through deduction” (Descartes AT X 365; CSM I 12). More precisely, experimental knowledge should be regulated by the intellectual powers, under which all experiences become experimentation (Baldassarri 2017).

From the epistemological point of view of the *Regulæ*, the method or *mathesis universalis* operates in steering evidence from the mind to experience through a few methodological operations, such as the disposition in a series, comparison, enumeration, and induction. The method, therefore, establishes experimentation within a mental order, restoring the intellectual evidence and reducing nature to intelligible patterns.

In this sense, mental construction defines cognition and provides an *ordo* of nature. If one wants to know colors, one should reduce their variety to a geometrical structure, as he suggests in the *Regulæ*. This system works especially for the physical knowledge of nature. In *Le Monde*, Descartes embeds his physics within a mental construction of a universe composed of extended matter in which the mechanical laws of motion are at work. In *L'Homme*, he frames the

explanation of living functions within the assumption of the animal machine. In all these cases, the mind provides a theoretical framework to encompass the knowledge of particular bodies, framing either physics or physiology within a mental order which is *a priori*. Then, within this *aprioristic* framework, scholars may develop the knowledge of the body of a discipline. As a result, cognition is a mental operation that constructs the boundaries and provides the principles for knowledge of particular sciences. Within these theoretical borders, one should add experiments to increase the knowledge of any discipline. As Descartes claims in the *Discours*, “regarding observations, the further we advance in our knowledge, the more necessary they become” (Descartes AT VI 63; CSM I 143). Scientific knowledge is thus a combination of intellectual evidence and experimentation.

Accordingly, the order of any *scientiae* should be the following: First, one should define the principles of a discipline through the intuition of the intellect – in the case of medical knowledge, there is a metaphysical principle, the mind-body distinction, a physiological principle, the mechanical laws of motions, and the animal machine. Second, one should deduce from these principles the rules operating in any discipline – these are the motions and arrangement of particles (of liquids such as blood) and the heat within the heart. Third, one should observe the structure of specific bodies to see how much these laws apply to it – Descartes invites the reader to perform anatomical dissections. Fourth, one should combine the theoretical framework with the experiential knowledge – from the observation of the cardiac movement and the perception of the heat in the heart, one will be able to infer that the blood heats the stomach and activates digestion or that the blood forms the animal spirits populating the nerves and the brain.

Yet, from the epistemology of the *Regulæ*, this order of knowledge could be unveiled in the structure of the *Principia philosophiæ*: first come the metaphysical principles (which also provide certainty); second comes the physical structure, which is mechanical; and third comes the experiential understanding of specific bodies (cosmology and observable nature such as

minerals, stones, magnets, and living bodies). Of course, while in the *Regulae* and the physics of the early 1630s, Descartes claims nature as a theoretical model and the intellect as a faultless ground of all knowledge, in the *Principia* Descartes adds a metaphysical role for God (mostly derived from the elaboration of the *Meditationes*), unfolding a traditional plan (Verbeek 2000) with an innovative system. This traditional plan somehow proceeds from Descartes' willingness to accommodate his natural philosophical program within the system of the school, thus replacing Aristotelianism. Grounding knowledge on the powers of the mind and on the clarity and distinctiveness of ideas helps him develop a new approach to nature, in which one constructs one's own knowledge through a mental order valid for everyone. To this system, one should add experimentation. Knowledge of nature easily follows.

As a result, this system works by reducing the variety, curiosity, and rarity of nature to a mental order: the fantastic cases that populate Renaissance culture, such as monsters, magic stones (e.g., he discusses the Bologna stone), and plant animals (such as the *Mimosa pudica*), ought to be reduced to his mechanistic system. By observing these strange objects as natural, one will know their mechanical structure and reduce their variety to a theoretical framework whose principles unify all nature and include these strange cases (Baldassarri 2019). Regrettably, Descartes was unable to bring his plan to completion, as the sections on animals and vegetation is left unfinished, while he later developed the section on the union of the mind and the body in the *Passions de l'âme*. In this text, psychology as a medical discipline finally emerges from his mechanistic framework, ultimately shaping early modern man.

In the end, his method provides an epistemological and theoretical framework in which all sciences ought to be embedded within, therefore achieving the project of a *scientia universalis* grounded in the powers of the mind, but innovatively combining experimentation and mental knowledge. If he left several corners of his project incomplete, he however shaped a modern philosopher and scholar who fights in battlegrounds,

teaches sovereigns, performs observations, cultivates a garden, and does commerce in the Amsterdam marketplace.

Conclusions

In this entry, I have presented Descartes' biography and philosophy. His main aim was to build a philosophy of nature to replace the Aristotelianism taught in schools and get rid of the uncertainties of new philosophies, such as those developed in the Renaissance and which attracted the attention of scholars in Paris, Germany, Prague, Italy, and the Netherlands. Yet, Descartes dealt with these philosophies, and, in the case of the Aristotelian tradition, he even referred to some texts as basic volumes one should use to outline various issues. Still, this has to be achieved within the order of reason.

Within this framework, Descartes conceived a system that provided an order for the discoveries he variously applied to the disciplines of knowledge: from the explanation of the rainbow to the heartbeat and sensation, Descartes' methodology proved his effectiveness at combining a theoretical, *a priori* architecture with experimentation and observations of more specific issues. Universal wisdom is intellectually established and guided and embeds experiments (and life) within the order of reason. This constitutes of an innovative project combining a priori theoretical knowledge with a posteriori experimentation and where traditional issues found innovative solutions. In sum, all philosophy is like a tree, whose roots are metaphysics, the trunk is the mechanical laws of physics, and the branches are the diverse disciplines, from which one picks the fruit. In practical terms, the result is a mechanical medicine (and especially a therapeutics) and a new morality through which he aimed to tailor the modern man, whose bodily functions and living activities are mechanically established (and could be therefore healed) and whose life is methodologically governed. Despite a few inconsistencies, his philosophy successfully grounded early modern reflections on nature and on the human self.

Devil, Renaissance Idea of

Siegrid Agostini

CESDES (Centro dipartimentale di Studi su Descartes “Ettore Lojaco”), Lecce, Italy

Abstract

In the aftermath of the Western Schism, Europe is crossed by concerns of eschatological and apocalyptic nature which weigh down and darken the intellectual and social climate of the time. In this context, the Devil, with his endless array of demons, represents one of the main symbols of the baleful omen predicting the end of the world. In the Middle Ages the Devil was represented as a creature relegated to

the infernal world, while in the Renaissance he made his incursions among the living through the phenomenon of the demonic possessions. The Devil and his acolytes, demons and witches, become subjects of reflections and debates of intellectuals, theologians, philosophers and artists, through increasingly sophisticated investigative tools.

Synonyms

Beast; Beelzebub; Demon; Lucifer; Mephistopheles; Satan; Serpent

Heritage and Rupture with the Tradition

The Devil is an essential figure both in Christian and not Christian Western horizon. In the mediaeval Christian tradition he is an absolute protagonist of the history: Christian spirituality, obsessed by the presence of evil among humanity, is persuaded that any enemy of Christianity is sent by the Devil.

Thanks to his innate ability to transform himself and take on various forms, he is represented iconographically with exaggerated and feral features symbolizing his moral monstrosity in order to distinguish him, together with the damned and the demons accompanying him, from the angelic creatures, and to arouse great fear to sinners.

But, if in these ancient descriptions Devil is a hideous monster, with a terrible smell and a particularly disgusting appearance, on the contrary, modern writers find him attractive, seductive, with a troubling and sometimes effeminate beauty, and an admirable speaking ability (Gregory 2013).

Innovative and Original Aspects

Between the end of the fifteenth and the seventeenth centuries, two different phenomena characterized the European culture: witchcraft and demonic possessions (Broedel 2003).

As for witchcraft, from the end of the fifteenth century up to the end of the seventeenth century, the whole of Europe was affected by an uninterrupted series of prosecutions, trials, lynchings, executions and burnings of people suspected to have concluded a pact with the Devil at the sabbath in order to perpetrate some of the most terrible crimes in his name and to destroy Christianity (Ostorero 2013). In 1436–1438 the German theologian Johannes Nider (1380–1438) published his *Formicarius*, the first demonological work in which the role of women in witchcraft is considered central (Clark 1997). On December 6th, 1484, Pope Innocent VIII produced the bull *Summis desiderantes affectibus* in order to instigate the zeal of the inquisitors to start trials against bewitchment and diabolical witchcraft for faith purification. The bull was the immediate cause of the work *Malleus maleficarum* (and, indeed, the bull was printed acting as its preface), which is one of the most famous inquisitors' manuals. The epigraph on its title page made clear its purpose: *Haeresis est maxima opera maleficarum non credere* ("To disbelieve in witchcraft is the greatest of heresies"). Written by the two Dominican inquisitors, Heinrich Institor Kramer and Jacob Sprenger (in fact much evidence points to Kramer as the sole author), and published in 1486, the *Malleus* had at least 34 editions between 1486 and 1669 (Flasch 2019).

As for demonic possessions, the *Malleus* exerted considerable influence on these phenomena, since it explained that even if demons could possess individuals directly with God's permission, they usually did so at the instance of witches. So, notwithstanding certain exceptions as Germany, witches were widely believed to have caused possessions by commanding the Devil to enter the bodies of their victims (Levack 2013). The phenomena of demonic possession, which took place throughout Europe, with particular intensity in Italy and France in the sixteenth century, contributed to fuel the obsession with the Devil, and to provoke phenomena of collective possession, especially in female convents, as evidenced by the cases of Marthe Brossier (1599), Louis Gaufridy (1609–1611), Loudun

(1632–1640), Louviers (1642–1647), d'Auxonne (1658–1663) (Lombardi 2005).

In Italy, two important treatises written by the exorcist Girolamo Menghi are published at the end of the 1500s: the *Compendio dell'arte essorcistica* (1576) and the *Flagellum daemonum* (1578) (Romeo 1990).

Discussions on the figure of the Devil were greatly influenced by the role played by the Reformation and the Counter-Reformation. Both Martin Luther and John Calvin, deeply concerned with the profound personal experience of evil (Johnston 2006), supported witch-hunting; later, confessional rifts between Reformed and Lutheran become fertile ground for mutual accusations of being servants of Satan.

Intellectuals, jurists and philosophers, too, as widely shown by the works of the Dutch physician Johann Wier (1515–1588) (Wier 1567), Henry Boguet (1550–1619) (Boguet 1602) and Jean Bodin (1529–1596) (Bodin 1580) largely contribute to the diffusion of the interest towards devils, witches and magic (Houdard 1992).

Impact and Legacy

During the Renaissance the fear of Devil and witches reaches its highest peak (Delumeau 1978), above all thanks to the role played by the press which, through the dissemination of editions and translations of the most famous demonological treatises, as well as of anonymous and popular pamphlets, contributes to create and nourish an increasingly heavy and disturbing eschatological atmosphere. Evidence of it is not only the fantastic narrative but also theatre production, histories of travel or scientific texts (Closson 2000); on the other hand, since the Protestant Reformation, the depictions of the Devil seems to be becoming rarer (Muchembled 2000).

Dialectic in the Renaissance

Abstract

Aristotelian dialectic went through a real renaissance in the first half of the sixteenth century in Italy. Thanks to the recovery and Latin translations of Alexander of Aphrodisias' and Averroes' commentaries, Agostino Nifo recovered the ancient meaning of dialectic as the art of conducting a structured debate between a questioner and an answerer: "Peirastic" dialectic serves to test claims to knowledge, and to prove principles to someone who denies them. Aristotle's *Topics* was also the basis for several treatises on the dialogue form by Carlo Sigonio, Torquato Tasso, and

Sperone Speroni. Finally, the recovery of Aristotelian dialectic spurred the birth of a new dialectic, incorporating important parts and concerns of rhetoric, in continuity with humanist approaches to reasoning and philosophy against Medieval dialectic.

Introduction

What Aristotle first called the "art of dialectic" underwent a true renaissance during the Renaissance and more precisely in the first half of the sixteenth century (Spranzi 2011). Despite humanists' attacks against dialectic, which they identified with barren and obscure scholastic logic, dialectic thrived in the sixteenth century, although it took on an entirely different meaning. Indeed, Renaissance authors recovered the original meaning that Aristotle gave to the term. Moreover, in an interesting switch, a newly defined discipline of dialectic developed some of the aspects that early humanists identified with rhetoric: it deals with things rather than words, and it allows its users to reach new knowledge and explore new domains rather than simply justify knowledge that has already been acquired. Its essential link with "invention" allows dialectic to incorporate the best part of rhetoric. As Lorenzo Valla writes in the preface to the second book of his "re-foundation" of dialectic and philosophy: "For dialectic used to be an entirely brief and simple thing, which can be seen from a comparison with rhetoric. For what is dialectic but a kind of confirmation and refutation? These very things are part of invention, which is one of the five parts of rhetoric" (Valla 2012, 175). In an interesting reversal, it is philosophers rather than rhetoricians who are seen as sophists, using empty and only superficially effective discourse. Humanists play Aristotle against (Medieval) Aristotelians: the perfect philosopher embodies, in Ciceronian fashion, the union of wisdom and eloquence (Seigel 2015). "Aristotle, who was a man of fervent spirits, discussed problems of the highest order and wrote about them (...). No greater contrast can be imagined than that between this great philosopher and a man who does not write anything,

understands but little, and shouts much and without consequence” (Petrarca 1948, 136).

Aristotle’s *Topics* (1989), the treatise he devoted to dialectic, became the founding text of a rich and innovative tradition of thought that came to completion in the Renaissance. Against the backdrop of humanist reactions to Medieval dialectic, an entirely new conception of dialectic emerged, linking dialectic to a structured debate between a questioner and an answerer. New translations of Aristotle’s *Topics*, and the recovery of the ancient commentaries of Alexander of Aphrodisias and Averroes newly translated from the Greek and from the Hebrew respectively, all contributed to the reinterpretation of dialectic in a sense which had been lost in Boethius’ early Medieval commentary (Stump 1978). Thanks to its intense editorial and printing activities, Northern Italy, and more particularly Padua and Venice, became the hub of a thriving intellectual activity around dialectic in the form of translations, commentaries, and treatises. Several treatises on the dialogue form and important treatises on a “new dialectic” enriched the tradition of Aristotle’s dialectic. In the second half of the sixteenth century, dialectic migrated north and it lost its Aristotelian nature. Although Aristotelian dialectic in the sense highlighted in the Renaissance was not explicitly discussed as such in later periods, one can sense its practical influence in forging a particular philosophical style, and in furthering a reflection on the nature of rationality, argumentation, and controversies.

Heritage and Rupture with the Tradition

A tradition of thought is “more than a coherent movement of thought. It is such a movement in the course of which those engaging in such movement become aware of it and of its direction and in self-aware fashion attempt to engage in its debates and to carry its enquiries forward” (MacIntyre 1988, 326). Aristotle’s *Topics* is a concise, quasi cryptic text, and the art it describes – dialectic – can probably be identified with what J. Barnes describes as “an early Apodeictic, unhampered by bonds of necessity and universality” (Barnes

1981, 58). It has been interpreted by scholars in widely differing ways: as an instrument for rational persuasion, as a tool for testing claims to knowledge and of raising doubts about uncertain statements, as an instrument for justifying claims to knowledge, and even as a way of reaching the first principles of the sciences (Sim 1999, IX–X). Given the absence of interpretative consensus, it is plausible to rely on some privileged moments of the tradition the text has initiated in order to highlight its meaning: focusing on Renaissance developments will offer a more dynamic, and historically plausible, reading of Aristotle’s founding text that might well be viewed as a canvas to be completed by later authors. Indeed, Renaissance commentators thought that they captured the real meaning of Aristotle’s text. Whether they actually did is a moot point, but they certainly gave it a reading that was informative, innovative, and coherent, and based on a careful and comprehensive analysis. In particular, against the Medieval scholastic tradition, Renaissance authors took seriously, and built upon, Aristotle’s assertion that dialectic is a kind of “examination” and that it “lies along the path to all methods of inquiry (‘pros tas apason tōn methodōn archas hodon echei’)” (*Topics*, 101b4). They went much further than Aristotle himself in explicating how dialectic, with its question and answer methodology, can achieve this goal.

Aristotle’s Dialectical Reasoning

Aristotle devoted the first book of the *Topics* to the definition of dialectical reasoning and to the discussion of its uses; the eighth and last book discuss different types of dialectic and its rules of implementation. Books II–VII contain the “topoi” properly understood: a list of argumentative blueprints for arguments and maxims that justify several types of inductive or deductive arguments. The whole of the Sophistical refutations was conceived as the ninth book of the *Topics* and considered as such by some commentators. It deals with improper uses of dialectical arguments and teaches ways to defend oneself from a sophistical opponent. Aristotle defines dialectic as follows: “A method (‘methodos’) by which we shall be able to reason deductively (‘syllogizesthai’) from

reputable opinions ('endoxa') about any problem set before us, and shall ourselves, when sustaining an argument, avoid saying anything self-contradictory" (*Topics*, 100a 18–21). Four points characterize dialectical reasoning: its essential link to dialogue and debate, the asymmetry between questioner and answerer, the crucial importance of dialectical premises, 'endoxa' and the particular nature of a dialectical problem, that can only be expressed in the following form: "Is X p or not p?." In other words, in Socratic fashion, the questioner takes up one of two contradictory theses, let's say p, and tries to deduce it by deriving it from a series of premises that have been suggested to the answerer. The latter has to concede them unless he has objections or the reasoning does not respect the argumentative maxims summarized in the 'topoi.' If he can prevent the questioner from deriving his/her thesis, then the answerer has indirectly proved its contradictory, non-p. If, on the contrary, he fails, then we can consider that the questioner's thesis is well-tested and corroborated. We shall call this rendition of dialectic "disputational dialectic." In this context 'endoxa,' the premises of dialectical reasoning, are not "probable" or "plausible" premises but rather premises which have powerful guarantors: "Endoxa," writes Aristotle, are those opinions "which commend themselves to all or to the majority or to the wise – that is, to all of the wise or to the majority or to the most famous and distinguished of them" (*Topics*, 100b 22–23). In this respect they differ from first principles ('archai'), the premises of demonstrative reasoning that command belief "through themselves." 'Endoxa' are not simply widely held opinions, but they are such as they can force the answerer's assent thanks to the authority which they have acquired *by being held* by such and such a group of people.

Aristotle, however, introduced some confusion. When he described the uses of dialectical reasoning for knowledge, he associated it not with disputations (what he calls "conversations") but with what we can call "*aporetic dialectic*" or reasoning in *utramque partem*: "if we are able to raise difficulties on both sides ('amphoterā diaporēsai') we shall more easily discern both

truth and falsehood on every point" (*Topics*, 101a 35–36).

Cicero and the Middle Ages: Dialectic as a Lower Form of Reasoning

In his commentary on Aristotle's *Topics*, Cicero interprets dialectic in this second sense, which is congenial to his mildly skeptical conception of knowledge (Cicero 1976). More importantly, he translated "endoxa" with "probabilia," a term under which he conflated two concepts: what is true for the most part ('eikota') and what is persuasive ('pithanon'); neither captures the original meaning of Aristotle's 'endoxa' as reputable opinions. The Latin translation of the term 'endoxa,' and the meanings it vehiculated, proved long-lasting. Boethius used this term in his Latin translation of the *Topics* – the only translation which was used until the Renaissance. His interpretation of dialectical reasoning was in line with this choice: dialectic became a secondary and less powerful form of logic where premises are only probable, rather than certain.

Later in the Middle Ages, dialectic came to be identified with the whole of logic and opposed to rhetoric. Probable, as opposed to demonstrative, reasoning was associated with rhetoric, a discipline attending to the persuasion of the many and to a superficial examination of things. Following the famous portrait of the liberal arts by Martianus Capella (1977), dialectic was defined as the handmaid of philosophy and it was represented as a beautiful, elegant and sober woman, whereas rhetoric was painted as a superficial woman, showing off her outward eye-catching appearances and hiding a deep inner shallowness. Albert the Great, for example, who wrote around 1250 B.C. the only Medieval commentary that was published and cited in the Renaissance, argued that dialectic is linked to invention not because it "lies along the path to knowledge" but rather because "it is mixed to conjecture and does not have a perfect grasp of the link between the premises and the conclusion ('consequentiae perfectam rationem')" (1890–1899, 233b). Dialectic, he writes, "deals with common notions which are not deeply entrenched in (things) ('non profundata in ipsis') as specific and

essential notions are, but which appear only in the surface” (234a). In the Middle Ages, the *Topics*, in particular book VIII, was also studied as an argumentation textbook and served as a source for different kinds of oral and written disputations, the ‘quaestio disputata,’ a form of dialectical verbal exercise which was despised by Renaissance humanists.

Innovative and Original Aspects

In contrast to their Medieval predecessors, Renaissance authors linked dialectical reasoning to a richer and truth-sensitive art. In an interesting reversal, logic, identified with Medieval dialectic, came to be represented as a skinny and frail woman, while rhetoric was pictured as an imposing, sensual woman of majestic beauty. However, the foundation of a new dialectic only became possible through the rehabilitation of the true meaning of Aristotle’s text, through the commentary literary form. By drawing on a more genuinely Aristotelian notion of dialectic, Italian Renaissance authors managed to rehabilitate the art of a regulated exchange of questions and answers against both demonstrative reasoning and sophistic rhetoric. They turned “disputational” dialectic into a subtle and powerful instrument for acquiring new knowledge and for proving it, not absolutely but to the best intellectual experts in each particular field. Renaissance authors took seriously the distinction that Aristotle made in the eighth book of the *Topics* between “peirastic,” “didactic,” and “sophistical” modes of disputational dialectic and they privileged the former as the only form of genuine dialectic. They developed in some detail the reasons why a peirastic form of dialectical exchange, where ‘peira’ means “examination” and “test,” can be useful for knowledge, a point that Aristotle himself had not sufficiently developed. Italian Renaissance authors developed this general approach to dialectical reasoning along three different directions: new commentaries on Aristotle’s *Topics* (a major commentary by Agostino Nifo, as well as an interesting more eclectic, anonymous, commentary produced by

the Venitian Academy); several treatises on the dialogue form (Carlo Sigonio in 1562, Torquato Tasso in 1585, and Sperone Speroni in 1574) and the Italian translation of one of the most influential treatises of the so-called new dialectic – Rudolph Agricola’s *De inventione dialectica* in 1567. All these developments, however, would not have occurred if it were not for an intense editorial activity centered around Padua (<https://www.merriam-webster.com/dictionary/padova>) and Venice that produced new translations and editions of Aristotle’s own texts on dialectic and of those written by his ancient commentators.

New Editions and Translations of Aristotle’s *Topics* and *Sophistical Refutations*, as well as of their Its Earlt Commentaries

Aristotle’s texts on dialectic (the *Topics* and the *Sophistical Refutations*) were retranslated several times from the Greek into Latin, replacing Boethius’ old translation. Jacques Lefèvre d’Etaples, a French Aristotelian Humanist, published the first Renaissance translation of the *Topics* under the title of *Libri logicorum* (1503). It became the reference translation and was republished in 1550–1552 in Aristotle works’ Junta edition. An interesting new Latin translation of both the *Topics* and the *Sophistical Refutations* was later produced by Johannes Baptista Rasarius.

What allowed Italian Aristotelians to breath new life into the Aristotelian notion of dialectic, however, were the recovery, Latin translations and editions of two major commentaries to Aristotle’s dialectical works: Alexander of Aphrodisias’ (second century AD) and Averroes’ (twelfth century AD). Although “alexandrinism” and “averroism” are usually considered as two different Renaissance schools of thought, as far as dialectic is concerned, they were used and discussed together (Kristeller 1960).

Alexander’s commentary on the *Topics* was recovered and published in Greek in 1513 and 1520, in Alexander’s *editio princeps*. Together with the pseudo-Alexander commentary on the *Sophistical Refutations*, it was translated into Latin several times in the first half of the sixteenth century, most notably by Baptista Rasarius (Alexander 1573). Alexander stressed the

essential link between dialectic and dialogue, the uses of dialectic for knowledge, as well as the similarities and differences between dialectic and rhetoric. The two arts deal with common principles and with all subjects. However, while dialectic does so from the point of view of what is “common and approved (‘koinon kai endoxon’),” rhetoric does so through what is “persuasive and approved (‘pithanon kai endoxon’)” (1573, 6a–b). More importantly, whereas rhetoric uses continuous discourse, dialectic addresses others through a sharp exchange of questions and answers.

Averroes, for his part, knew Alexander’s commentary which had been translated into Arabic in the eighth century; his own middle and short commentaries on the *Topics* and on the *Sophistical Refutations* were translated from the Hebrew into Latin in the 1520s. Both commentaries were included in Aristotle’s Junta Latin edition of 1550–1552. Averroes restructured Aristotle’s logical corpus and included rhetoric in the *Organon*. He separated the first and the eighth books of the *Topics* from the middle books (which barely listed a number of argument forms), and he considered them on a par with the *Posterior Analytics* and the *Rhetoric*. He viewed each of these arts as describing different ways of securing “assent” (the Arabic ‘tasdiq’): whereas the assent brought about by demonstration cannot be challenged, the assent brought about by dialectical arguments is as firm but can be challenged (Averroes 1977, 47). This itself is indicative of the fact that Averroes valued arguments with respect to how they contribute to creating conviction, rather than with respect to their formal characteristics.

Nifo’s Commentary on Aristotle’s *Topics* and the Logic of Disputation

The Aristotelian philosopher Agostino Nifo (Mahoney 1971) obtained his degree in philosophy and medicine in Padua in 1490, taught in Padua, Pisa, Rome, Naples, and Salerno, and died in 1538. His commentary on Aristotle’s *Topics* appeared posthumously in 1540 and 1542 in Paris and in 1557 and 1569 in Venice (Lohr 1988). He also wrote a commentary on the *Sophistical Refutations*, which appeared for the first time in Venice in 1541. In his commentaries, he firmly

anchored dialectic in the Aristotelian tradition against both Plato and the Stoics. Indeed, unlike these major sources of dialectic, he does not understand dialectic as a straight road to knowledge, but rather as a flexible tool for achieving well tested albeit provisional conclusions. In a conciliatory move, Nifo cites and critically discusses passages from Alexander of Aphrodisias’ and Averroes’ commentaries, and he even integrates elements of Albert the Great’s Medieval commentary.

By harmonizing all these different sources, he paints a coherent picture of dialectic’s nature and function: “It is clear, he writes, that dialectic is worth the attention of those who philosophize, insofar as it is of no little weight in the invention of truth itself (‘ad ipsius veritatis inventionem momentum non parum praebet’), which is the aim of the philosopher” (1573, 2.1). He explicitly links the function of dialectic for knowledge to the confrontation between a questioner and an answerer. Dialectic is fore and foremost a tool for regulating dialectical exchanges so that they can play a positive role for acquiring, testing, and confirming knowledge. It differs both from sophistry, which he believes was practiced by Medieval logicians known as ‘caculatores,’ and demonstration. Like Alexander, Nifo considers that the difference between dialectic and demonstration is not in the *form* of the syllogism, but in its *matter*, namely in the nature of their respective premises. Rephrasing Aristotle’s definition of syllogism in the *Topics* (100a 25–27), Nifo writes that every syllogism is “a discourse (‘oratio’) in which from something which has been conceded, something else follows” (1573, 2.2). But whereas “demonstrative syllogisms [reason] about necessary things from true and necessary [premises] (‘circa necessaria ex veris et necessariis’), dialectical syllogisms [reason] about probable things from probable [premises] (‘circa probabilia ex probabilibus’)” (ibid.).

Although he uses the Latin term ‘probabilia’ to translate the Greek ‘endoxa,’ the premises of dialectical reasoning, Nifo follows Aristotle and Alexander in interpreting the term “probable” not as “what is true for the most part,” but rather as “what is approved”: “For nothing is more probable

than something else thanks to its own nature, but [only] as long as we approve it ('probamus'). We approve what appears to us, which is demonstrated by the Greek word; for 'probabilia,' which in Greek are called 'endoxa,' are also called 'approved' ('approbata')" (1573, 4.4). According to Nifo, therefore, probable premises are those premises which are more easily conceded to by the answerer in a dialectical disputation, and thus indirectly contribute to the corroboration and establishment of the questioner's thesis. By contrast, Albert interpreted "probable premises" as those which "appear" to someone and are "common," as opposed to "specific," in the sense of "superficial."

Nifo's commentary is especially useful for detailing the reasons why dialectical reasoning is conducive to knowledge. He draws on both Alexander and Averroes in order to develop Aristotle's very allusive rendition of the purposes of dialectic. He builds especially on what Aristotle described as the third and the fourth uses of dialectic, i.e., reasoning *in utramque partem*, and traveling towards the principles of the sciences. On the first point, Nifo argues that by furnishing arguments on both sides of an issue, dialectic can help in the "invention and judgment of the truth" (1573, 7.1). In detailing the heuristic function of dialectic, Nifo gives a positive interpretation of Aristotle's "aporetic" dialectic, distancing himself from Cicero's mild skepticism. He provides three reasons why aporetic dialectic is useful for knowledge: (a) by multiplying arguments, it increases the probability of someone hitting upon the truth; (b) the practice of aporetic dialectic can reinforce our knowledge of the truth, by preparing us to answer possible objections to our own theses; (c) dialectic can enable us to recognize ("judge") the truth, should we hit upon it, by building a *habitus* through exercise (1573, 2.3): through "the practice of disputation ('exercitium in disputationibus')," a "good condition of the soul ('bona animae valetudo') is created, thanks to which dialectic can invent and judge the truth ('inventrix et iudicatrix veritatis')" (7.1).

On the second function of dialectic, which corresponds to Aristotle's fourth use ("for the knowledge ('ad cognitionem') of the truth of

first principles" (1573, 7.2)), Nifo, following Alexander, associates dialectic to justification rather than discovery. Through disputation, writes Nifo, dialectic does not help us find the principles themselves but proves them to someone who denies them. In this process, the questioner and the answerer have the same task. Both Alexander and Nifo explain that the "common task" mentioned by Aristotle (*Topics*, 161a22) is not the fact of carrying out the disputation itself. Rather, since a statement is proved when the questioner derives the conclusion from premises that cannot be denied by a sufficiently knowledgeable answerer, both contenders indirectly share the burden of ensuring that the conclusion is either refuted or well-tested.

The Treatises on the Dialogue Form: Sigonio, Tasso, and Speroni

Dialogue is a very common style in the Renaissance, and it is used for a variety of purposes: literary, moral, and even scientific (Snyder 1989; Cox 1992). But dialogue is also theorized in a particular way. Three major works describe the conceptual underpinnings of the dialogue form: Carlo Sigonio's *De dialogo liber* (1993), Torquato Tasso's *Dell'arte del dialogo discorso* (1982), and Sperone Speroni's *Apologia dei dialogi* (1989). All these authors are in one way or another linked to the Venetian academy, which also produced an anonymous commentary on the *Topics* and the Italian translation of Agricola's *De invention dialectica*. The first two treatises are remarkably similar in that they both link dialogue to Aristotle's dialectic as it is expounded in the *Topics*. They defend the use of dialogue as a privileged "road to truth" (Armstrong 1976).

As far as Sperone Speroni is concerned, he bases his own theory of the dialogue form on an aporetic, Ciceronian version of dialectic. He writes that far from being an instrument for acquiring or testing knowledge, dialogue is the antithesis of serious science: it is a "pleasant garden" (1989, 274), filled with digressions and allowing its author to decline responsibility for the statements it contains. According to Sigonio and Tasso, on the contrary, dialogue is the "image of a

dialectical disputation” (Sigonio 1993, 14v), in the Aristotelian sense of the term: a disputation “is a rational investigation (‘disquisitio rationis’) conducted among learned men by means of questions and answers (a procedure the Greek called ‘dialegethai’)” (ibid., 12v). Dialectic provides dialogue with the instruments which are necessary “in order to sustain the difficult and subtle task of debating” (ibid., 14v). This is especially true for what he calls “inquisitive” dialogues, that differ from both didactic and sophistic dialogues, and that correspond to what Aristotle calls “peirastic” disputations. Insofar as it embeds a disputation, a dialogue is connected to dialectic, and insofar as it is an “image” of it, it is founded upon poetic imitation. These two functions are based respectively on the power to reason and on the power to fictionally represent someone else’s discourse. Sigonio’s treatise explores both issues with great subtlety.

In order to explain the essential link between dialogue and dialectic, Sigonio discusses four issues: the historical and intellectual origins of dialogue, its “nature and force,” its constitutive parts, and finally its various forms. He states that there are two ways of examining an issue: “One in which one seeks out what truth there is in things within oneself, and another with somebody else. Of which the first consists of a certain silent activity of the mind, the second consists of an open questioning and answering with the person with whom we engage in a disputation” (ibid., 4v). Knowledge gained by dialectical reasoning is different from that derived by both scientific discourse and rhetorical persuasion. Dialectical reasoning uses premises that are common, as opposed to specific, and commonly accepted (‘opinabiles,’ the Aristotelian ‘endoxa’) as opposed to true. It deals with topics about which one can discuss on both sides and it yields a knowledge which is always accompanied by doubt insofar as it is “unstable and perishable (‘caducam atque instabilem’)” (ibid., 38r). Science, on the other hand, addresses itself to experts and produces firm and imperishable conclusions. Dialectical reasoning also uses “probable” as opposed to “necessary” reasoning; whereas

“necessary” arguments produce a “tacit change of mind,” “probable” arguments cause an “open confession” (ibid., 5v). This is a reference to the fact that the questioner’s reasoning depends on the answerer’s assent. But dialectical reasoning also differs from rhetoric: rhetorical assent is not only produced by reason but is also “driven by desire (‘ab appetitione impellitur’)” (ibid., 39r).

Dialogues, however, are not real disputations, but only images of them. Sigonio argues that in order to ensure that they are faithful representations of the underlying disputations, and that therefore, the conclusions they arrive at are reliable, a writer of dialogues has to respect poetic “probability (‘verisimilis’)” and “fitness” (‘decorum’). “Poetic probability “ensures that things which are fictional do not appear so” (ibid., 18v). Fittingness places restriction on the representation of the characters so that a reader finds them appropriate, familiar, and coherent. Moreover, the different roles of “confirming,” “refuting,” and “listening” have to be assigned to different characters. This is designed to make the dialogue both more intelligible and more credible.

Agricola’s New Dialectic and Rhetoric : The Art of Proving Statements

Rudolph Agricola’s *De inventione dialectica* was written in 1479 in Italy at the end of his ten-year stay in Pavia and Ferrara, and was published for the first time in 1515 in Louvain. It became a very influential dialectic textbook in northern Europe. The treatise is composed of three books: the first is devoted to the topics, as the seat of different arguments; the second concerns the nature of dialectic and rhetoric, and the third deals with the role of affects and disposition in dialectical invention. Unlike Ramus, Agricola is uninterested in judgment. He finds judgment simple and uninforming, insofar as it concerns the form rather than the content of discourse. Its function is limited to verifying that the reasoning “is not fallacious and misleading” (DID 8). Rather, Agricola focuses on dialectical “invention” that he understands as a particular “logic of inquiry” (Cogan 1984, 182). Moreover, he thinks that reasoning by question and answer is just one possible kind of

dialectical argument among others. In these two respects, he clearly follows Cicero rather than Aristotle, despite the fact that he explicitly states that he takes his inspiration from Aristotle's *Topics*, and wants to improve on his text, that he considers as too obscure and limited in scope. He argues that whereas Aristotle restricts dialectic to things that cannot be demonstrated, "dialectic applies to everything which we can dispute about through some reason or method." A question, the subject matter of dialectic, is simply "all matter in doubt" (II.6; DID 206–207).

Agricola defines dialectic as "the art of disputing in a probable way ('ars probabiliter disserendi') about any proposed thing, to the extent to which the nature of its object is capable of conviction ('fidei')" (1967, II.2, 193). The term "probable" does not mean that which is approved or truthseeming, but it is linked to what Agricola considers as dialectic's main task, namely to *prove* something, albeit in the generic sense of "removing doubts" about it (Cogan 1984, 196). Dialectic thus becomes a general art encompassing many forms of argumentative discourse. Demonstration is but a particular kind of dialectical reasoning, one employing a more stringent reasoning, and using specific, as opposed to common, premises. Moreover, the most important components of rhetoric are also incorporated into dialectic. Indeed, Agricola devotes the third book of his textbook to affects and disposition, traditionally considered as crucial dimensions of rhetorical persuasion. Rehabilitating Boethius' distinction between an argument (the content of discourse) and an argumentation (its form), he argues that proving a statement also implies constructing an argument to the effect that a particular audience is convinced: the "nerve" of discourse, he writes, is intimately and inextricably associated to its "flesh" (III.14; DID 441).

But according to Agricola, arguments are not only verbal tools. Rather, "[Agricola] makes the more sweeping claim that there are similar connections really existing in the world" (Mack 1993, 141). Insofar as the topics, as the "seat" of arguments, also serve to describe the objects to which they refer, an argument reveals the *real*

relationships existing among objects and events in the world. Agricola writes: "By following these headings, we can turn our minds around the things themselves and perceive whatever in each of them is convincing and suitable for what our speech sets out to teach" (I.2; DID 9).

Dialectic in Northern Europe

In the second half of the sixteenth century, Aristotelianism migrated north (Schmitt 1983). Outside Italy, notable humanist translations of Aristotle's *Topics* include Périon's *Topicorum libri VIII*, published in Paris in 1558, Charpentier's *Aristotelis ars disserendi* published in Paris in 1567 and 1572, and Julius Pacius' *Organon* which was published in Geneva in 1584 and included the Greek text.

The French school, itself divided into Aristotelians and anti-Aristotelians, gave different, and less innovative, renditions of dialectic and developed it in two divergent directions: Périon and Charpentier wrote looser humanistic commentaries giving dialectic a Platonic and Ciceronian reading. Also, anti-Aristotelians like Peter Ramus paradoxically developed a form of dialectic oriented towards judgment rather than invention, tailored as a scholastic tool for apologetic and for suitable forging a new juridical logic. This approach to dialectic, geared towards the study of argument forms, was developed in the German-speaking countries by Philip Melancthon, Yohannes Eck and Julius Pacius. Dialectic became a practical and useful discipline but lost its Aristotelian connection to dialogue and invention.

Impact and Legacy

Quite surprisingly, disputational dialectic – a well-regulated exchange of questions and answers – was not taken up as an object of study in the seventeenth century and onwards. Dialectic, and dialectical reasoning, became an enlarged form of logic. The different argument forms highlighted and discussed as 'topoi' in Aristotle's texts (the *Topics*, the *Rhetoric*, and the *Sophistical Refutations*) were integrated into logic proper, and served as a basis for juridical logic, which became

the quintessential dialectic. Unlike Agricola, however, judgment, as opposed to invention, came to be viewed as the most important part of dialectic, and from this point of view, Peter Ramus's and other anti-Aristotelians' legacy was far more important than that of Renaissance Aristotelians. The reasons why the structure and meaning of dialogical reasoning ceased to be a specific object of study are obscure. However, Renaissance dialectic lived on in practice and influenced the writing of philosophical, and even scientific, dialogues. In more contemporary times, two trends in argumentation theory and philosophy of science can be viewed as the continuation of the tradition of Aristotelian dialectic. Although these contemporary works do not refer specifically to Renaissance authors, they implicitly use elements of the tradition of dialectic which percolated through the centuries, undetected, so to speak. The first is informal logic and the search for a softer form of rationality. Reasonable discourse, equally comprising elements of logic and rhetoric, has come to be recognized as a more adequate approach to scientific reasoning. Although the term "rhetoric of science" is sometimes used to characterize this approach, it is a rich notion of rhetoric, rather than the mere compilation of figures of speech and advices about the delivery of discourse, which serves as a model for this enlarged notion of rationality. Second, a rehabilitation of dialogical exchanges has provided the backdrop for the theorization of controversies as a necessary tool for advancing knowledge, as well as for the study of a pragma-dialectical approach. Different kinds of dialogical exchanges can thus be thematized which are reminiscent of the Renaissance Aristotelian classification of different types of dialectical exchanges: didactic, "peirastic" (both constructive and destructive), and sophistical.

Digby, Kenelm

Born: 11 July 1603, Gayhurst, Buckinghamshire

Died: 11 June 1665, Covent Garden

Florence Hazrat

Cambridge, UK

University of Sheffield, Sheffield, UK

Abstract

Kenelm Digby was an English courtier, book collector, and natural philosopher, advancing in particular the fields of chemistry and

biology. He carried on his service to the state beside his scientific experimentation and a lively involvement in the international intellectual life of his time. Digby is a transitional figure, attempting to synthesize Aristotelian traditions on the body and the soul with modern developments of atomism and mechanical physics. Among his various commentaries and treatises, his “On the body” (published 1644), especially the pioneering chapters on embryology, was most influential.

Biography

Digby is born into a family of ancient gentry, strongly holding fast to their Roman Catholicism (his father was executed for involvement in the Gunpowder Plot of 1605). He is homeschooled by Jesuits before enrolling at Gloucester Hall, Oxford, in 1618, a college which required no religious conformism. Owing to his personal and scholarly brilliance, Digby makes an impression on Thomas Allen, Gloucester Hall’s don and co-founder of the Bodleian Library, so much so that he calls him “the Mirandola of his age” after the noble Florentine philosopher Pico della Mirandola (John Aubrey, *Brief Lives*, 1.225). Between 1619 and 1623, Digby goes on a grand tour to France, Italy, and Spain, making connections to the European political elite and the continental intelligentsia, as well as collecting books and manuscripts, and continuing his study of natural philosophy. Upon his return to England, he marries his childhood sweetheart, Venetia Stanley (1600–1633), to whom he remains devoted his entire life. The couple had three surviving sons. From 1628 to 1629, Digby gains wealth and national admiration in a privateering campaign against ships from France and Spain with whom England is at war at the time. When his wife suddenly dies in 1633, a grief-stricken Digby retires from public life to Gresham College, then a center of scientific research. Pursuing scholarly and religious freedom, Digby moves to Paris in 1635 where he meets Thomas Hobbes. Upon killing a nobleman in a duel, Digby returns to England in

1641 but is imprisoned at the beginning of the civil war in 1642. During his 1-year incarceration, Digby writes a commentary to Thomas Browne's *Religio Medici*, as well as two scientific treatises, "On the soul" and the immensely learned and influential "On the body." Upon his release in 1643, Digby joins Queen Henrietta Maria's household in Paris and spends the next years petitioning the English parliament for restitution of his confiscated estates and his right to return. Back in England in 1654, Digby mostly withdraws from politics in favor of scientific experimentation in his laboratory in Covent Garden. He is among the earliest members of the Royal Society founded in 1660 but largely retires from active involvement. After a long and illustrious career in international politics and science, Digby dies from illness at home in 1665.

Heritage and Rupture with the Tradition

Like most learned persons of his age, Digby was thoroughly trained and intensely interested in astrology, alchemy, and other mythical lore (such as the cyclical death and rebirth of the phoenix) and conducted experiments pertaining to the same. Aristotelianism, although by no means monolithic, was still central to the university curriculum, and Digby attempted to wed various interpretations of it with current sceptical trends spearheaded by René Descartes. While accepting Thomist metaphysics, he embraced chemical theories of atomism, together with mechanical physics which understood processes in the world as matter in motion. Like Pierre Gassendi, Digby attempted to integrate contemporary interpretations of received knowledge with recent scientific developments in rational thought and deduction.

Innovative and Original Aspects

In his huge work the *Two Treatises* (1644), Digby sets out to infer the immortality of the soul through evidence from the physical world. The longer first part, "Of bodies," describes

natural phenomena via his blend of Renaissance Aristotelianism with atomism and mechanical physics. The second part, "On the soul," circumvents Christian theology, basing its proof for the existence of the soul on purely material grounds, a testament to its time, yet less influential than Digby's experimental deductions on embryology.

In a publication for the Royal Society, *A Discourse Concerning the Vegetation of Plants* (1661), Digby realizes the importance of air to plant growth, putting a basic theory of photosynthesis forward. He constructed several laboratories for experimentation, contributing to the advancement of empirical knowledge but also falling prey to faulty conclusions and fanciful beliefs such as his recipe for "sympathetic powder" which, when applied to the weapon, was thought to cure the wound made by it.

In his later life, Digby focused on refining and gathering recipes for cooking, alchemy, and medicine, a collection of which was posthumously published by his steward George Hartmann, *A Choice Collection of Rare Secrets* (1682). Digby also had a lifelong interest in wine-making and wine-keeping, inventing, for example, an improved bottle.

Impact and Legacy

A true Renaissance man, Digby excelled in various activities, including private, public, and scholarly life. Widely read in his own age, he was often mentioned in the company of leading thinkers of his times with whom he sustained lively correspondences. After his death, however, his fame and authority as scientist declined, perhaps owing to his sometimes arcane beliefs and reliance on authorities. Most of Digby's observations, however, draw on some form of scientific experimentation, attempting to reconcile neo-scholasticism with empiricism. Apart from his natural philosophy, as well as his dashing figure at court, Digby's legacy also stretches into the humanities: donating some of his choice collection of manuscripts and early printed books to Oxford and Harvard universities, he

also saw through for preparation of the 1640 Folio of Ben Jonson's poetry in manuscript form, attesting to his lively role in the intellectual and cultural lives of England and the Continent in the seventeenth century.

Dilthey, Wilhelm

Born: 19 November 1833 (Biebrich, Germany)

Died: 1 October 1911 (Seis am Schlern, Austria-Hungary)

Dustin Garlitz

Department of Philosophy, University of South Florida, Tampa, FL, USA

Abstract

This entry focuses on the Renaissance work of German Kantian philosopher of the human sciences Wilhelm Dilthey (1833–1911). Emphasis is placed on Dilthey's original works on the Renaissance, his formative influences, and his impact on Renaissance philosophy scholarship in the German-speaking world. Included in the entry are his interlocutors in Renaissance philosophy scholarship. Also included in the entry is the review work of Renaissance material that Dilthey wrote over the course of his academic career.

Biography

Wilhelm Dilthey (1833–1911) was a German philosopher of the human sciences. Trained as a Kantian, Dilthey was a Professor of Philosophy at the University of Berlin. He conducted research on a philosophy of the human sciences at a time when the leading members of Neo-Kantianism that surrounded him in Germany attempted to

provide a philosophy of the cultural sciences. Accordingly, Dilthey's work has been characterized by hermeneutics and as part of the German historical tradition.

Original Aspects

Dilthey studied the Renaissance, especially Renaissance humanism, in relation to the Reformation, arguing that the Reformation developed in the same manner as the Renaissance. He regarded these two historical periods as the foundation of the modern world. Dilthey published *Weltanschauung und Analyse des Menschen seit Renaissance und Reformation* in 1893 (Dilthey 1914), in which he made such an argument. In his studies of the Renaissance, Dilthey was first influenced by the historian Jacob Burckhardt at the University of Basel. His *Hermeneutics and the Study of History* (Dilthey 2010) includes his writing on Burckhardt's Renaissance. Dilthey in fact started to criticize Burckhardt's approach to the Renaissance as early as 1862. The argument has been made by commentators that while Dilthey may have appropriated a great amount of history of Renaissance scholarship from Burckhardt, especially as related to the realm of the social, he departed from Burckhardt's aesthetic approach to cultural history. Therefore, commentators have argued that Dilthey's notion of the aesthetic in Renaissance philosophy scholarship is original. Commentators have also sought a convergence in this Renaissance philosophy scholarship with that of Ernst Cassirer (Cacciatore, 1997) (Leinkauf, 2003) (Luft 2004).

Dilthey, in his history of philosophy scholarship, was concerned with how the Roman Stoics influence the philosophers of modernity, and the path in between (Frohmman 1995). Identified was a "natural system" (Leinkauf 2003, p. 47) that gave birth to Renaissance philosophy historically. In addition to seeking a convergence in Dilthey's Renaissance philosophy scholarship with that of Cassirer, recent commentators have placed his work aside twentieth-century historians of Renaissance philosophy such as Eugenio Garin (Cacciatore 2011). Both Dilthey and Burckhardt

studied in Berlin under the historian Leopold Ranke. Dilthey's work influenced subsequent German-speaking scholars' work on Renaissance philosophy, including that of Ernst Bloch and the aforementioned Cassirer. Dilthey's work on Burckhardt's Renaissance is developed in the context of his larger career projects of hermeneutics and the study of world-intuition in historical perspective. Dilthey's work on the Renaissance, in part, related to that of Italian thinker Niccolò Machiavelli. Dilthey in fact challenged Burckhardt's cultural-historical interpretation of the Renaissance in his 1862 review of *Die Kultur der Renaissance in Italien*, 2 years after the work's initial publication in Germany. Dilthey engaged in a controversial dialogue with Ernst Troeltsch in Germany regarding his research on the relation between Renaissance humanism and the Reformation. Troeltsch would go on to train Renaissance historian Hans Baron, while Dilthey would influence the Renaissance work of philosophers Cassirer and Bloch, among other German intellectual thinkers.

Diogenes Laertius

Born: Unknown, Likely Early Third Century CE, Greek-Speaking Mediterranean

Died: Unknown, Likely Late Third Century CE, Greek-Speaking Mediterranean

Ada Palmer

Department of History, University of Chicago,
Chicago, IL, USA

Abstract

Known for his compendium *Lives of Eminent Philosophers* (*Bíoi kai gnōmai τῶν ἐν φιλοσοφίᾳ εὐδοκμησάντων*), which contains short biographies of 82 classical philosophers. The compendium is extremely unreliable, but provides many otherwise-unknown biographical details, titles of lost works, and more than a thousand excerpts and references to more than 250 authors, including three long letters of Epicurus, which are the only works by Epicurus surviving from antiquity.

Synonyms

[Lives of eminent philosophers](#); [Lives of philosophers](#)

Biography

Practically nothing is known about Diogenes Laertius beyond the fact that he was well educated. His compendium is provisionally dated to the mid third-century CE because he mentions Theodosius the Sceptic, Saturninus, and Sextus Empiricus, but does not discuss Neoplatonists or Neopythagoreans. References to his compendium in Stephanus of Byzantium and Sopater of Apamea confirm that was circulating by 500 CE. “Laertius” was a common nickname for the learned in post-classical times, referring to Odysseus son of Laertes, though a phrase in Stephanus of Byzantium, “Διογένης ὁ Λαερτιάδης” suggests that Diogenes might have come from a town called Laerte, perhaps in Caria and Cilicia. Others have suggested descent from clients of the Roman Laertii. He mentions that he wrote a poetry collection titled *Πάμμετρος*, now lost, and he quotes 39 of his own epigrams. Efforts to assign him to a particular school – Epicurean or skeptic – cannot be confirmed.

Transmission

One tenth century text, *Tractatus de dictis philosophorum*, shows knowledge of Diogenes Laertius. In the twelfth century Henricus Aristippus produced the first Latin translation, now lost, which was the basis of the anonymous Italian compendium *On the Lives and Mores of the Philosophers* (*De vita et moribus philosophorum*) once attributed to Walter Burley (1275–c. 1345). The Pseudo-Burley compendium circulated widely, surviving in more than 270 manuscripts. It was printed seven times in the sixteenth century, but its popularity waned with the recovery of the Greek original. In the 1420s Giovanni Aurispa brought a complete Greek manuscript to Florence from Constantinople, an expedition financed by the future Pope Nicholas V. In 1433 a Latin translation was executed for Cosimo de Medici by the Camaldolese monk and theologian Ambrogio Traversari (1386–1439). Traversari's translation circulated widely in manuscript, was first printed in Rome in 1472 and was reprinted more than

20 times by 1600. Although a new translation by Tommaso Aldobrandini (1540–1572), the brother of Pope Clement VIII, was completed in the 1560s and published in 1594, along with annotations on the first nine books, Traversari's translation remained dominant into the seventeenth century Hankins and Palmer (2008). Revised versions of Traversari's Latin were undertaken by Joannes Boulierius (Jean Boulier), Janus Sambucus (János Zsámboky, 1531–1584), and Henricus Stephanus (Henri Estienne, c. 1528–1598).

Greek circulation came late. The Greek lives of Aristotle and Theophrastus appeared in the second volume of Aldus Manutius's 1497 Aristotle, but the first complete Greek edition was printed by Froben in 1533, a full century after the completion of Traversari's translation. Vernacular translation began with the 1545 Italian edition by Bartolomeo, Lodovico, and Pietro Rositini, then a 1598 Italian paraphrase by Giosefo Salviati, a 1602 French edition by François de Foucherolles, and another French translation by Gilles Boileau in 1658. Comments and annotations on the work, primarily philological in nature, were published by Stephanus (1570), Isaac and Meric Casaubon (1583, 1593), and Gilles Ménage (1664, 1690).

Impact

In the Renaissance, Diogenes Laertius was used as a biographical source, and as a model for organizing the history of philosophy Hicks (1972), and Le Page (2012). The compendium divides philosophers into two traditions: Ionian Philosophy, including the Seven Sages, predecessors and followers of Socrates, Plato, the Academy, Peripatetics, Cynics, and Stoics; and Italian Philosophy, including Pythagoreans, miscellaneous thinkers including Eleatics, Atomists, and Skeptics, and finally Epicurus. This division was used by Marsilio Ficino (1433–1499) in his reconstruction of the intellectual genealogy of ancient thought, and by Giovanni Pico della Mirandola (1463–1494) and Johannes Reuchlin (1455–1522) especially in their forays into Pythagoreanism. Reading Diogenes Laertius stimulated Nicholas of Cusa (1401–1464) to write his *De venatione sapientiae*

in 1463, and many biographical details from the compendium appear in the entries on philosophers in the 1506 encyclopedic *Commentaria Urbana* of Raffaello Maffei Volterrano (1451–1522). In the sixteenth century, content from Diogenes Laertius – in excerpt or paraphrase – was frequently used by printers in introductions to print editions of ancient thinkers' works. The self-professed Christian Epicurean Pierre Gassendi (1592–1655) used the life of Epicurus extensively in his 1649 *Life and Mores of Epicurus*, and the 1625 *Electa Laërtiana* by Scottish humanist Walter Donaldson contains an account of the triumphant history of philosophy based on Diogenes Laertius and influenced by Ficino.

Dioscorides (Διοσκουρίδης)

► Dioscorides and Greek Herbals

Dioscorides and Greek Herbals

Born and Died: First Century AD, Anazarba [Asia Minor]

Alain Touwaide
Institute for the Preservation of Medical
Traditions, Washington, DC, USA
The Huntington, San Marino, CA, USA

Abstract

Traditionally considered a physician who accompanied the Roman troops as a military surgeon under the emperors Claudius or Nero, Dioscorides is the first-century author of a vast compilation in Greek on the natural substances to be used as ingredients for medicines (plants, animals, and minerals), identified in scholarly literature as *De Materia Medica*. The work was transmitted by an abundant manuscript tradition in Greek and Arabic, with some Latin translations, rearrangements, and derivatives. Early printed in Latin (1478) and in Greek (1499), it was edited five more times during

the sixteenth century and abundantly translated first into Latin and further on in the vernacular and also commented on, with multiple editions, particularly by the Italian Pietro Andrea Mattioli. The treatise acted as a catalyst on the Renaissance transformation of *materia medica* and botany. After a first phase of classicizing interest, it provided the main substance of Brunfels and Fuchs' herbals devoted to medical botany, to be further studied per se to properly identify the plants. The gradual development of botanical descriptions rapidly made the work obsolete, as did also the amalgamation of plants originally not described in it, which led to its collapse and made it necessary to compile botanical encyclopedias on a fresh basis as early as the late sixteenth century.

Alternate Names

Dioscorides (Διοσκουρίδης); **Dioscorides, Pedanius** (Πεδάνιος Διοσκουρίδης).

Biography

The author of a massive compilation in Greek on the substances used in the preparation of medicines (*De Materia Medica*) (Wellmann 1906–1914), Dioscorides is not well known. Born in Anazarba in Cilicia (southeast Asia Minor), he is credited in scholarship with an activity as a military physician (or surgeon) with the Roman troops under the emperors Claudius or Nero. He may have frequented Roman administrators in Cilicia, possibly in Tarsus, sometimes during the third quarter of the first century AD (Touwaide 2007). He collected information on over 1000 medicinal substances (plants, animals, minerals, and manufactured products). Although many Greek manuscripts contain color representations of the plants studied in the work, it is not known whether these illustrations date back to Dioscorides' original or are additions. Since the work is not cited in Pliny, *Naturalis Historia*, it is believed to have been published after 75 AD ca.

Heritage and Rupture with Tradition

The heir of a tradition of writings on *materia medica* in the Greek World, the work innovated, according to its preface, by its coverage and organization of data. Renouncing to the alphabetical order, Dioscorides chose another, which he did not explicitly explain, however (Touwaide 1999). Because of its sheer volume and the lack of information on the exact nature of this organization, data have been rearranged in different ways in Byzantium, including a herbal, which contains a selection of entries devoted to plants, ordered according to the alphabetical order of their name.

Impact and Legacy

The treatise had an extraordinary diffusion in Byzantium. It underwent multiple textual transformations resulting from its use in medicine which made it necessary to edit it in the fourteenth century in Constantinople. Translated into Latin before the sixth century AD (possibly several times), it was also rendered into Syriac in the sixth century and into Arabic possibly as early as the late eighth century in an early version and several times again from the ninth to the twelfth century. In the West, Pietro d'Abano brought an alphabetical version from Constantinople, which he translated into Latin and commented on at Padua University. This version was printed as early as 1478. The form of the Greek text supposedly original was printed as early as 1499 by Aldo Manuzio, and five times from 1516 to 1598, sometimes with a Latin translation and commentary. Multiple translations, first into Latin and further on into the vernacular, were also printed, many of which with commentaries. The most famous and most largely circulated were those by Pietro Andrea Mattioli, originally published in Italian and subsequently translated into Latin, Czech, German, and French, with multiple reeditions.

Renaissance interest in the treatise was enormous (Riddle 1980). First studied by Ermolao Barbaro (which left his work unfinished and

unpublished), *De Materia Medica* was promoted by Nicolao Leonicensio in his effort to return to classical Greek science and probably edited by him for its printing by Aldo Manuzio. Barbaro's commented translation, which was posthumously printed in 1516, heralded a first wave of classicizing studies subsequently represented by Marcello Virgilio Adriani in Florence and Jean Ruel in Paris. These translations were quickly superseded by the herbals of the so-called *German fathers of botany* Otto Brunfels (*Herbarum vivae eicones*, 1530) and Leonhart Fuchs (*Historia Stirpium*, first published in Latin in 1542). These works (with black and white woodblocks of the plants) were largely based on the text of Dioscorides (together with that of Theophrastus and Galen) in Latin translation without much critical analysis. They mostly aimed to equate the ancient Mediterranean and the north/central European flora (Reeds 1991). The translations and commentaries published from 1544 on by Mattioli (with illustrations from 1554 on) popularized *De Materia Medica* thanks to their multiple versions in different languages and their constantly revised and augmented editions. Besides identifying the plants described by Dioscorides, Mattioli introduced multiple new species which he amalgamated to the text, obscuring its classification system and consequently generating the need for new and comprehensive botanical syntheses and classification system. The last sixteenth-century edition (1598) is typically more philological than botanical in nature.

Dissenters from the Anglican Church

Manuela Bragagnolo
Max Planck Institute for European Legal History,
Frankfurt am Main, Germany

Abstract

English Dissenters were Protestant Christians who chose to worship outside of the established Church of England in the early modern period. English Dissent mainly followed two streams, one of which was radical and influenced by continental Anabaptism, and the other was Calvinist and

Puritan. The freedom of religious practice that was granted during the English Republic was followed by a period of persecution under the Restoration when the term “Dissenter” emerged to stigmatize clergymen and their followers who resisted the Act of Uniformity and left the established Anglican Church.

Heritage and Rupture with Tradition

English Dissenters were Protestant Christians who chose to worship outside of the established Church of England in early modern period. They have been known by different names, including “Anabaptists,” “Brownists,” “Separatists,” “Sectaries,” “Dissenters,” “Nonconformists,” and “Free Churchmen,” depending on the circumstances and nature of their Dissent.

Two different theological sources were at the root of English Dissent, which mainly followed two streams, one radical and the other Calvinist (Watts 1978). The first one can be traced back to the pre-Reformation movement of the Lollards, based on the teaching of John Wycliffe (ca. 1330–1384) (McFarlane 1966), which was subsequently influenced by continental Anabaptism. This tradition then went underground, moving to the Netherlands with John Smyth (1554–1612), and reemerged in England with the seventeenth-century “General Baptists.”

The second one streamed from Elizabethan Calvinistic Puritanism. This movement aimed at “purifying” the church of its Catholic elements and initially tried to reform the Anglican Church from within. Some individual Puritans moved towards separation in the 1570s, founding congregations first in England and then in the Netherlands (Hahn-Bruckart 2017). This was the case of Robert Browne (ca. 1550–1633) and Robert Harrison (ca. 1545–1585), and “Brownists” or “Separatists” became the earliest terms to signify groups outside of the established Anglican Church. But the majority of those in the Puritan movement can be described as “nonconformists” as

they declined to conform to certain practices that had been set out in the Prayer Book of 1559 which they considered to be “Roman,” while still remaining in communion with the Church of England.

Innovative and Original Aspects

The situation changed greatly with the civil war and English Republic (1641–1662). The freedom of religious practice granted in England during this period allowed many people to join Puritan circles, and some also joined the Quakers, founded by George Fox (1624–1691) (Villani 1996).

Following the Restoration (1630–1685) however, dissenters were subjected to persecution under various acts of the parliament; non-conformists were excluded from all municipal offices and the Act of Uniformity of 1662 demanded that all clergymen, teachers, and professors adhere to the Book of Common Prayer in its entirety. The term “Dissenter” for referring to clergymen and their followers who resisted the Act of Uniformity and left the established Anglican Church emerged at this time (Hahn-Bruckart 2017).

Impact and Legacy

After the Toleration Act of 1689, a wave of “New Dissent” emerged, influenced by German Pietism and connected to the Evangelical Revival. By the mid-nineteenth century, the term “Nonconformists” gradually replaced that of “Dissenters” to refer to people who attended religious services outside of the established church (Watts 1995, 2015; Hahn-Bruckart 2017).

Docta Ignorantia

Andrea Fiamma

D’Annunzio University of Chieti-Pescara, Chieti, Italy

Abstract

The expression *docta ignorantia* (“learned ignorance”) refers to a gnosiological doctrine by Nicholas of Cusa emphasizing human structural inability to know the truth. Cusanus states that human mind is characterized by the fact that it builds relationships between the things,

moves itself belonging to quantity and quality and between things opposed to each other. But truth has neither quality nor quantity, and it is the infinite coincidence of the opposites. So, mind because of its finitude is inadequate for knowing the truth. The learned ignorance doctrine stems from Nicholas of Cusa's reworking of Dionysius' *Mystical Theology*. It has been conceived in contrast to scholastic gnosiology and rests on the claim that there can be no correspondence between intellect and things. In the sixteenth century, this doctrine becomes widespread especially in France.

Term

The expression "learned ignorance" refers to a gnosiological doctrine emphasizing human structural inability to know the essence of things. Nicholas of Cusa is the first to mention the "learned ignorance" in the Renaissance (Cusanus 1440; Haubst 1992). By this expression he indicates a gnosiological doctrine that contrasts the scholastic one of *adaequatio intellectus ad rem*. In *De docta ignorantia* I, 3, Cusanus states that the human mind, because of its finitude, is unable to precisely attain the truth. The awareness of such ontological inadequacy of our intellect vis-à-vis the "precise [ultimate] truth" constitutes learned ignorance. Cusanus depicts learned ignorance as a polygon inscribed in a circle: while the former, with its finite number of sides, represents the human mind and the latter hints at the essence of things. No matter how much the number of sides might be increased, the polygon will never precisely fit the circumference, unless it turns into the circle itself. So human knowledge is conjectural in its nature. This view does not lead Nicholas of Cusa to scepticism. Instead, he emphasizes the importance of our finite knowledge as the only way we have to attain what is finite and to approximate what is infinite.

Heritage and Rupture with the Tradition

In the *Apologia doctae ignorantiae*, Nicholas of Cusa argues that learned ignorance was also used

by Augustine and Bonaventure (Schnarr 2009). Recent studies have emphasized that learned ignorance belongs to the tradition of the medieval interpretations of Dionysius the Areopagite's *Mystical Theology*. Some examples are found in John Scotus Eriugena, Meister Eckhart, and Albertus Magnus (Duclow 2006). It should be noted, however, that Nicholas of Cusa has distanced himself from these authors, accusing them in *De beryllo* not to have properly understood Dionysius' philosophy. Other scholars consider learned ignorance as a legacy of the School of Chartres' theology (Albertson 2014).

Innovative and Original Aspects

In the late Middle Ages, the prevailing gnosiological conception relies on the Aristotelian-Thomistic view, according to which knowledge takes place as correspondence between mind and things. In contrast to this view, the learned ignorance recognizes the ontological inability of our intellect to precisely fit things. Thus the *docta ignorantia* represents one of the first philosophical attempts at breaking with the medieval world (Cassirer 1927). In Cusanus' view, the learned ignorance should have entailed a renewal of philosophical theology (Flasch 1998). He regards the learned ignorance as the structure of all human knowledge. This leads him to formulate a new ethical and theoretical perspective within the doctrine of conjectures (Bocken 2004). However, the most innovative application of learned ignorance takes place in metaphysics and cosmology (Blumenberg 1966; Flasch 1998). In the second book of *De docta ignorantia*, Cusanus argues that man cannot precisely locate the center of the universe. Some scholars have claimed that this output of Cusanus' researches about the universe anticipates in some sense the Copernican revolution (Duhem 1917).

Impact and Legacy

In the *Apologia doctae ignorantiae*, Cusanus reports that the learned ignorance method has

had some fortune among his Italian contemporaries. In the fifteenth century, some copies of *De docta ignorantia* circulate in the humanists' milieu. Pico della Mirandola mentions Cusanus' "learned ignorance" and "conjecture" doctrines (Flasch 1980). In the sixteenth century, the learned ignorance is mentioned by French humanists, mostly in the domain of morals, as a principle borrowed from Augustine and Petrarch (Santinello 1969; Emery 1984; Meier-Oeser 1989). In the *Apologie de Raymond Sebond*, Michel de Montaigne appeals to the learned ignorance as a call for humility on the path to knowledge and quotes some geometrical examples on the circle and the circumference mentioned by Cusanus in *De docta ignorantia* (Montaigne 1580; Gelder 1961; Avis 2016). This "sceptic" interpretation of Cusanus' thinking, however, weakens the original ontological import Nicholas of Cusa has ascribed to learned ignorance (Bocken 2002). Lefèvre d'Étaples instead traces the notion back to negative theology and to Dionysius the Areopagite's *Mystical Theology* (d'Étaples 1527). He employs learned ignorance as a doctrine for mystical knowledge. Beatus Rhenanus highlights the positive potential of knowledge *per doctam ignorantiam* and identifies a thematic affinity with the Rhineland tradition (Rhenanus 1505; Faye 1998). Charles de Bovelles, in *De sapiente*, argues that the learned ignorance has a role in positive knowledge building, and in *De nihilo*, he takes over Cusanus' attempt to build a philosophical theology of infinity according to the principle of learned ignorance (Bovillus 1510a, b). Bovelles also mentioned a several number of geometric examples drawn from Cusanus' works (Albertini 1993, 2000; Secchi 2006).

Docta Religio

Manuel De Carli

Centre d'Études Supérieures de la Renaissance,
Université de Tours, Tours, France

Abstract

Docta religio, or learned religion, in the intention of his creator, Marsilio Ficino, is the outcome of a process aimed at unifying in one system the whole religious experience of humankind, thus reconciling philosophy and religion.

This theme is treated widely in *De christiana religione* (1473–1474). The

fundamental purpose of this work is to proclaim the absolute identity of *pietas* and *sapientia*, i.e., the inseparable unity of *religio* and *philosophia*. Only the Platonic-Hermetic philosophy is seen as rich in esoteric evocative power and capable of showing, even to the illiterate, the most secret and divine mysteries, the chief and essential truths at the basis of the highest spiritual experiences.

Heritage and Rupture with the Tradition

Docta religio, or learned religion, in the intention of his creator, Marsilio Ficino (*De christiana religione*), is the outcome of a process aimed at unifying in one system the whole religious experience of humankind, thus reconciling philosophy and religion. This concept is based on the assumption that between ancient religion and Christianity there is no opposition, but a certain continuity. Philosophy and religion, according to Ficino, are parts of a single historical-salvific process reaching its ultimate climax with Christianity, which constitutes a *perfecta religio*. The task of the philosopher is to bring the continuity of this process to light and to illustrate the mysterious genealogy of *sapientia*. *Sapientia*, in Ficino's opinion, comes into being by divine revelation in ancient Egypt and – through Pythagoras and Plato – reaches Jesus Christ. Afterward, thanks to the mediation of the Neoplatonic philosophers, *sapientia* reaches the Church Fathers and Dionysus the Areopagite. Without taking into consideration medieval Scholasticism – which represents, in Ficino's view, an irreligious philosophy due to its intrinsic Aristotelianism – *sapientia* directly reaches the Renaissance of the fifteenth century. The red thread that unifies the religious experience of humankind is indeed represented by philosophy. While the Orphic, Hermetic and Chaldean doctrines constitute a *prisca theologia*, Platonic thinking and Christian religion both have the task of organizing revelation into an organic doctrinal corpus, which Ficino calls *pia philosophia* with the intention of bringing it to a

full end (Hankins 1994; Allen 1995; Lauster 2002).

In Ficino's view, the origins and development of philosophy consist in an enlightenment of human mind, brought about by divine revelation (Ficino 2001). It shines the light of a single truth upon the world, along different paths, often hidden and in need of being unveiled. Thus, Ficino intends to grasp that one *sapientia* in all the forms in which it reveals itself: in the sacred books, in the poets' compositions, in the harmony of the heavens, as well as in the perfect arrangement of nature, expressed in its perennial beauty. *Pia philosophia* is therefore changed into a *docta religio*, capable of grasping the divine roots of everything: the unfolding of Unity in the inexhaustible multiplicity of its creation (Garin 2008). As a man of Providence – as he defined himself – Ficino is convinced that his *docta religio* is the only religion capable of accomplishing, after the Middle Ages, a renaissance of his own times marked by Platonic philosophy. It will be able to involve all the spheres of human action: from philosophy to theology, from arts to literature, and from ethics to politics.

Innovative and Original Aspects

This theme is treated widely in *De christiana religione* (1473–1474). The fundamental purpose of this work is to proclaim the absolute identity of *pietas* and *sapientia*, i.e., the inseparable unity of *religio* and *philosophia*. Ficino claims the right of philosophers to treat *divinae res*. Ever since ancient times, they have been at the same time priests and wise men, investigators of *causae rerum* and regulators of the worship of the primary cause. In order to support his thesis, Ficino does not fail to invoke a long tradition. In ancient Jewish times – Ficino recalls – the prophets were also philosophers. Similarly, in ancient Persia, the Magi would oversee religious rites and, at the same time, engage in speculation. The Egyptian priests were custodians of the secrets of both divine and material nature. In ancient Greece, Linus, Orpheus, Musaeus, Melampus, Eumolpus,

Aglaophemus, Trophimus, and Pythagoras were also priests. Moreover, the Indian Brahmins and Gaul Druids were wise men and priests. Not differently, the proto-Christian Presbyterians and Episkopos were devout saints and men of learning (Ficino 1476).

On the basis of such premises, Ficino formulates his program of reformation of the Christian religion. He is convinced that the separation between *pietas* and *sapientia* has caused serious consequences. If philosophy has become a tool of impiety in the hands of totally unbelieving men, the care of sacred things is entrusted to priest without learning. The only possible remedy for this situation is represented by the reunification of religion and wisdom. This can be done by recovering the principles that religion and wisdom have in common – that ancient, deep core of *veritas* which all men must share. Religion can be enlightened and confirmed by *sapientia* by returning to the sources of the old tradition of *prisci theologi*, i.e., the philosophers–theologians who were the guardians of one common truth (Vasoli 1999; Gentile 2002). Orpheus and Zoroaster, Hermes Trimegistus and Pythagoras, Plato and Plotinus, and Porphyry and Proclus represent, together with the scriptural *auctoritates*, the leading exponents of a *docta pietas*, or *pia philosophia* (Ficino 1476). The latter will no longer be entrusted to the intellectual poverty of an unlearned clergy or to the blurred knowledge of scholastic theologians. Only the Platonic–Hermetic philosophy is seen as rich in esoteric evocative power and capable of showing, even to the illiterate, the most secret and divine mysteries, the chief and essential truths at the basis of the highest spiritual experiences. These are the necessary criteria that can restore to religion its character of “universal endowment” of humankind, thus joining it to the Platonic, Hermetic, Chaldean, and Orphic philosophy (Vasoli 2007).

In Ficino's view, the renaissance of this *docta religio* – philosophic and sapiential religion – will restore to the *sapientes* their function as highest administrators of human knowledge and divine *misteria*. Ficino addresses the philosophers and priests of his times, so that they may, by common

consent, devote themselves to such renewal of the religious doctrine (Ficino 1476).

As a priest and philosopher himself, Ficino proposes himself as a master of those new ranks of artists, technicians, merchants, and politicians, far removed from the theological discourse, now willing to take part in the debate on the major themes of the *christiana veritas*, to trace back to the reading of the Biblical and Evangelical sources, and to seek a *renovatio*, in those times of deep unease and growing spiritual anxiety (Vasoli 1988).

Impact and Legacy

From the outset, the ideal of *docta religio* would achieve a success destined to go beyond the circle of the first Ficino's followers (Garin 1966), as shown, for example, by its spread in Jewish contexts (Lelli 2000). In the age of Counter-Reformation, the encounter between Platonic philosophy and Christianity, postulated by *docta religio*, would prove quite problematic and would stir up a number of contradictions and controversies, mainly on an ethic ground, such as those concerning the notions of sin, freedom, predestination, evaluation of deeds, and grace (Papuli 2002; Verardi 2011).

Dolet, Etienne

Born: 3 August 1508, Orléans

Died: 3 August 1546, Paris

Michèle Clément

Faculté des Lettres, Sciences du Langage et Arts,
Université de Lyon, Lyon, France

Abstract

Etienne Dolet represents the complexity of intellectual life in the first half of the sixteenth century: before his imprisonment in Paris in 1544, he is intensely active in Lyon between 1534 and 1544; orator, poet, historian, grammarian, linguist, translologist, editor, publisher, and printer, he made the most of each of his competencies to build a very diversified *oeuvre* in only 10 years. The determination of his intellectual and religious positions is much more complex and uncertain. It would be a mistake to pin a simple label on them. The question whether Dolet was a “freethinker” or a “Gospel propagator” is not the right one. Etienne Dolet was a humanist; he died for being a humanist. Language will be at the heart of his thinking; he is a philologist and a philosopher because of language.

Biography

Étienne Dolet is born in Orléans in 1508 (see Bingen 2018). He began his literary studies in Paris in 1520, then went to Padua in 1525 to study rhetoric with Simon de Villeneuve, until 1528. After returning to France, he began law studies in Toulouse in 1532, then flew to Lyon in the summer of 1534. As a proofreader, an author, and an editor at the workshop of S. Gryphe, he published several books, among others, his *Commentariorum linguæ latinæ*; he trained in the book trade and owned his own printing shop in 1538. Between 1542 and 1544, he went through three successive trials: the first inquisitorial trial in 1542 sentenced him to the stake; the trial on

appeal in 1543 saved him, and the one on September 1544 sentenced him again, for being an Epicurean, and led him to the stake. He was burnt with his books in place Maubert in Paris on August 3, 1546, on his forty-eighth birthday.

With Etienne Dolet, we touch the complexity of intellectual life in the first half of the sixteenth century: orator, poet, historian, grammarian, linguist, translologist, editor, publisher, and printer, he made the most of each of his competencies to build a very diversified *oeuvre* in only 10 years. The determination of his intellectual and religious positions is much more complex and uncertain. It would be a mistake to pin a simple label on them. The question whether Dolet was a “freethinker” or a “Gospel propagator” (Febvre 1957, p. 231) is not the right one. Etienne Dolet was a humanist; he died for being a humanist. Language will be at the heart of his thinking; he is a philologist and a philosopher because of language.

His polemical first book, *Orationes duae in Tholosam*, published in Lyon in 1534, opens his intellectual carrier, which will develop under the sign of Ciceronian Latin that he will defend, against Erasmus, among others. From 1536, he becomes a popularizer of the French language, quickly understanding the political, historical, medical, and religious stakes. Before his imprisonment in Paris in 1544, he is intensely active in Lyon between 1534 and 1544. He is simultaneously a poet with the *Carmina* (Langlois-Pézeret 2009), the author of a dictionary with the *Commentariorum linguæ latinæ*, a translator, a historian of the reign of Francis I, a scientific publisher, and a printer (Cicero, Terence, Virgil, Suetonius, Sophocles, Aesop, Galen, Marot, Rabelais, Castiglione, Erasmus, the Psalms, the New Testament, etc.). However, his admiration for the pagans, his studies in Padua, and his problematic Christianity will lead him to the stake. At the end of a first trial by the Inquisition in 1542, he is condemned as a heretic for publishing prohibited books and using the word “*fatum*” “non comme devait le faire un chrétien” (Longeon 1977, p. 26); King Francis I grants him his clemency in 1543. Dolet backslides willfully in 1544 with the publishing of the *Second Enfer* (Dolet 1544) as well as two of Plato’s dialogues

dedicated to the king. One of the dialogues contains the sentence that will kill him. One sentence from the *Axiochus* (ascribed at the time to Plato) enables the Sorbonne to accuse him on 4 November 1544 of denying the immortality of the soul: “Quant à ce dialogue mis en français intitulé *Axiochus*, ce lieu et passage, c’est à savoir “attendu que tu ne seras plus rien du tout” est mal traduit, et est contre l’intention de Plato, auquel n’y a, ni en grec, ni en latin, ces mots *rien du tout* [. . .] “attendu que tu ne seras plus rien du tout” est *dictum epicuraeum*” (Longeon 1977, p. 71). The *Parlement* of Paris condemns him to death on 2 August 1546. The sentence is executed on 3 August. Using a word that questions Christian providentialism (*fatum*), translating a sentence in a radical way, and printing forbidden books, these are the reasons for his execution. Like Berquin in 1529, Michel Servet in 1553, or Giordano Bruno in 1600, Dolet dies an intellectual, because he contributed to the richness of public space without self-censorship or caution.

Providing the texts from antiquity without Christianizing them is one of the risks that Dolet takes, just as he risks the printing and circulating texts which have been condemned by the Sorbonne. Dolet is defined by the intellectual risk that combines philological strictness and audacious transmission. The risk was covered by the king until 1544 (“privilege” of 1538; “lettres de rémission” of 1543) (Longeon 1977, p. 41). Did Dolet overestimate the king’s authority in the face of the power of the Church and the *Parlement*? In his jail, the philosopher is naked.

Doni, Agostino

Born: Mid-sixteenth century, Cosenza

Died: After 1583, unknown place

Viviana Strangis

Department of Humanities, University of Calabria, Arcavacata, Italy

Abstract

Agostino Doni was an Italian physician, philosopher, and heretic of the second half of sixteenth century. His work, *De natura hominis* (1581) is strictly related to the Italian context of the first *novatores* in the field of natural philosophy. He can be partly considered as a follower of Bernardino Telesio, partly as a freethinker of his own.

Biography

Agostino Doni was born in Calabria (Southern Italy) in the mid-sixteenth century. In the frontispiece of *De natura hominis*, he defines himself *Augustini Doni cosentini, medici et philosophi*. During his youth, Doni was detained for 5 years in the prisons of the Inquisition due to

religious reasons. This information is obtained from one of Doni's letters, in which he says "religionis causa me habuit in carcere adolescentem per quinquennium" (Rotondò 2008, p. 762). No explanation is given for his arrest but it is reasonable to assume that it is related to the cruel massacre of the Waldensians that took place in San Sisto and Guardia Piemontese in June 1561.

In the late 1570s, he probably studied philosophy and medicine at the University of Padua, learning the new critical approach to the Aristotelian-scholastic tradition. Soon after, he left Italy, persecuted by accusations of heresy. In the winter of 1579, he went to Basel, a city well known for religious tolerance and freethinking. Here he formerly received a kind hospitality, getting acquainted with some eminent men of the university. In fact, he had the support of personalities known as protectors of those thinkers who fled for religious reasons: Basil Amerbach, rector of the university, and Theodor Zwinger, physician and professor of medicine. Doni was then able to devote himself to his studies, achieving, in 1580, his doctorate in medicine.

He received hospitality in the house of Francesco Betti (1521–1590) and worked with the famous printer Pietro Perna (1557–1582). He spent a brief period far from Basel, because of some preposterous accusations moved against him, which later he proved to be unfounded. About 1581 Doni came back to Basel, working out, with the support of Zwinger, to the publication of the *De natura hominis*, which came out the same year, by the prestigious printer Hieronymus Froben.

De natura hominis (dedicated to Stephen Bathory, King of Poland), Doni's only known work, was soon considered one of the most original in the field of the natural philosophy, causing his name to appear among the number of the new philosophers of late Renaissance Italy.

Since the beginning, Doni explains the focus of his study: the investigation of human nature. He can be considered an innovator because for the first time his psychology of human nature is examined from a physical point of view. Like every other living being, the human is the result

of the cooperation of two active forces, heat and cold, operating on a certain portion of matter. In the first book of his work, Doni gave a critical reading of the medical tradition of Hippocrates and Galen (on one hand), and of the Aristotelian philosophy (on the other). In the second book, which represents the *pars construens* of the work, Doni holds the vital core of his philosophy: “Omne quod natura constat vim sentiendi habet et sine ea esse non potest” (Doni 1973, p. 333). The *spiritus-sensus*, the only vital force acting within the nature, is equivalent to the mind, in a continuous process of self-organization of the knowledge. It is a new philosophy *sub species hominis*, where human is not considered as a set of two distinct parts, but as a single living body able to perform thoughts and actions. It is the unity of the spirit to ensure the unity of the human being. In the effort to be faithful to its radical naturalism, Doni decides to start from the faculties belonging to the spirit.

The hectic events of the months following the publication of his work remain shrouded in mystery: the philosopher of Cosenza precipitously left Basel to travel to Poland hoping to find the protection of King Bathory.

At this point in his restless wandering, it becomes difficult to reconstruct the events of the last part of Doni's life: some witnesses reported that he had religious controversy with some Italian intellectuals exiled in Krakow, especially with the historic Venetian Gian Michele Bruto (1517–1592).

The difficulties, the isolation, and the “melancholy humor” pushed Doni most likely to abandon the Polish city, as we learn from the latest news transmitted by the nuncio Alberto Bolognetti (1538–1585) in 1583. From that moment we lose track of him.

Doni, Anton Francesco

Born: 16 May 1513, Florence

Died: September 1574, Monselice (Padua)

Alessandro Arienzo

Università degli Studi di Napoli “Federico II”,
 Naples, Italy

Abstract

Anton Francesco Doni was born in 1513 in Florence. Writer, musician, painter, and printer, he is credited as being the first Italian bibliographer for his two collections, *La libreria* (1550) and *La seconda libreria* (1551), in which he lists and discusses contemporary volumes as well as imaginary texts. His most relevant works are *I marmi* and *I mondi* in which (in witty, malicious, and sometimes melancholic tones) he laments the corruption of his age and the decay of civil and religious sentiments. While in his basic features Doni's humanism is the expression of courtier cultural world, he distinguishes himself for his moralistic critique, and sometimes melancholic rejection, of the ideology of the court.

Biography

Mostly renowned as a writer and a printer, Anton Francesco Doni was born in 1513 in Florence, son of Bernardo d'Antonio, a humble scissors-maker. Little is known of his youth, except that he probably served militarily under Giovanni Bandini in 1530 and Luigi Guicciardini in 1534 or 1535. Out of economic need, at an unknown date, he entered the Servite Order in the Santissima Annunziata Monastery of Firenze and was ordained under the name of Fra' Valerio. In 1538, he wrote a laudatory letter to Pietro Aretino, showing a profound knowledge of his works and an interest in literature and writing. Uncomfortable with religious life, in the early months of 1540, Doni left the monastery and Florence and moved to Genoa, embracing the life of the "letterato" and started living by his pen. During his journey, he also visited Alessandria, Pavia, and Milan in search of patronage, which he may have enjoyed for some time from Duke Alessandro De' Medici and Cardinal Ippolito de' Medici. In January 1543, he arrived in Piacenza where, having failed to read law and having a greater interest for letters, he joined the Accademia Ortolana with the nickname of "Semenza" (seed). The Accademia Ortolana was a literary circle of literati and nobles with an interest in light forms of literature and worldly pleasures. Its members also shared a strong anti-clericalism. Within this context, Doni published his first literary work, a long letter with an annex of sonnets written by other members of the Accademia.

In 1544, Doni moved to Venice where he printed a collection of *Lettere* (1544) and a *Dialogo della musica* (1544). Doni had a lifelong interest in music, and his *Dialogo* is, in fact, a collection of madrigals, dialogues, and music of various authors, intermixed with his own dialogues and verses. In Venice he probably met Aretino, to whom he offered the first book of his *Lettere*. The following year, he published an enlarged edition of his collection and his reputation grew, but his earnings were not sufficient to live from his art. He struggled to find a position as a courtier and unsuccessfully offered his

services to a variety of nobles and prelates. Following the split of the Accademia Ortolana, and having alienated the nobility of Piacenza in search of patronage from Duke Pier Luigi Farnese, Doni moved to Florence and reinvented himself as a printer for Duke Cosimo de' Medici. His first printing effort was a new edition of his own *Lettere*. At the beginning of 1546, he was chosen as secretary of the Accademia Fiorentina, and his printing shop began to prosper. He then broke with Lodovico Dominici, a former friend and a member of the Accademia, whom he accused of being a heretic and a Calvinist. Having alienated the sympathy of his former associates, in late 1547, he closed his printing shop and departed to Venice to work as an editor for the printer Aurelio Pincio. The following year, he edited Ortensio Lando's translation of Thomas More's *Utopia*, to which he added a valuable introductory letter. Between 1548 and 1550, he also benefited from the support of Pietro Aretino, which provided him with occasional work. In 1549, he wrote a treatise on sculpture and painting, the *Disegno*, and the following year, a historical work on the life of Caesar, *La fortuna di Cesare*. In 1550, he then moved to Giolito's shop, at the beginning to work as an editor and translator and then as an author. With Giolito he published his *La libreria* (1550), the first Italian bibliography of Italian contemporary authors and classics. While in Venice, Doni helped to create the Accademia Pellegrina of which he was the secretary from 1553 to 1563.

It was from the 1551 to 1553 that Doni enjoyed his most fruitful years of his literary life. In 1551, he printed his *La seconda libreria*, a work that also includes lists of imaginary authors and books filled with comments seldom related to the works in question. It also includes short stories, observations, and comments intermingled with mythology, moral advice, ancient histories, novels, and his own observations on the contemporary world. His next book published was *La zucca*, a collection of moral tales, witticisms, aphorisms, and letters, printed in four parts in late 1551 and in 1552. In 1552, Doni also published *La moral filosofia* (1552), a large edition of his *Lettere*, and the *Pistolotti amorosi* (1552), a satire of

Petrarchism and love treatises. However, it was in 1552 and 1553 that Doni wrote his most relevant works: *I marmi* and *I mondi*, the latter with its accompanying *Inferni*. In 1553, he also gave in print a new treatise of moral philosophy, *L'asinesca gloria*, in which the humble and patient ass is contrasted with the cruelty and ambition of mankind.

The prosperity that the success of these works gave Doni did not last. Because of a serious fever, he was unable to write, and in 1555, he had to leave Venice in circumstances not completely understood due to an altercation with a Florentine priest. Despite the previous good relations with Aretino, in 1556, he published the *Terremoto* subtitled "with the ruin of a great Colossus, bestial Anti-Christ of our age" (Grendler 1969: 62). The book is deemed to be "the finest example of diffamatory writing in the sixteenth century, for Doni hurled every imaginable insult against Aretino in language worthy of the Scourge of Princes himself" (Grendler 1969: 62). The quarrel, however, did not last for long, as Doni had predicted that Aretino would die in the year 1556, "and Aretino obligingly expired in October of that year" (Grendler 1969: 62).

Little is known of Doni's activities in 1556 and 1557; in 1558, he tried to open a printing press in Ancona but was forced to leave the city because of Paul IV's order that all vagant friars were to return to their convents. From the middle of 1558 to August 1562, there is no trace of his activities. Probably in 1559, he wrote a comedy, *Lo stufaiuolo*, which was not printed until 1861. In 1562, three new works by Doni were published. Of these the most significant is a cabalist numerology (an expansion of a section of *I marmi*), which tried to prove that Luther was the great beast of the Apocalypse. In 1654, he wrote *Le pitture*, a collection of allegorical word pictures, and, after his retirement to Monselice (near Venice), he wrote *La lumiera*, a poem lamenting man's miserable fate and failings. In late July 1574, Doni journeyed in Venice aiming to present the French King Henri III a poem on the battle of Lepanto. In September of the same year, he died.

Doni's Literary Activity

Anton Francesco Doni is a very complex humanist intellectual. A writer, musician, painter, and publisher, his works are rich in observations, wit, and inventions, described in his *Zucca* as "chiacchiere, filastrocche, frappe, chimere, castelli in aria, [...] novelle, cicalecci, parabole, baie, proverbi, motti, umori ed alter giravolte e storie" (chitchat, rhymes, fripperies, chimeras, castles in the air [...] tales, chatters, parables, jests, proverbs, jokes, humor, and other twists and stories) (soni 1656: c.72). This quotation is representative of Doni's prose, strongly influenced by the Florentine tradition established by Dante, Petrarch, and Boccaccio and by the "regionalistic" belief in the superiority of the Florentine tongue, clearly expressed in *I marmi*.

Doni is a very typical figure of a late Renaissance literato, who struggled to live by his pen while at the margins of courtly society. In a letter of 7 February 1553 to the sculptor Giovan Angelo Fiorentino, Doni confessed that "io scrivo del continuo, per non passar la vita malinconica più tosto che cercar fama, con ciò sia di che di tutte le cose che hanno fine terreno mi fo beffe, e ridomene come sono le mie carte" (I restlessly write, so that I will not spend my life in melancholy, rather than for seeking fame. I laugh at all earthly things, as I do in my writings) (soni 1994: 401). In all his works, the witty, malicious, and sometimes melancholic tone depicts his complaints about the corruption of his age and the decay of civil and religious sentiments.

Doni's religious ideas can be deduced from his constant polemics against monasticism and from his desire for a Christian renewal that, while sympathetic to the critical spirit of the Reformation, never questioned Catholicism. In this sense, Doni participates in a very common aspiration toward the Erasmian ideal of a Christian religion based on charity and modesty. He was certainly in contact with a few representatives of the Italian Reformation, such as Francesco Linguardo and Lelio Sozzini, and in an interesting letter to B. Guerrieri, a well-known leader of the Reformation in Siena, dated 28 November 1546 (ed. by

Grendler 1969), he expressed his faith in a manner not too distant from Lutheranism and Calvinism.

I marmi and the *Mondi* are probably Doni's two most notable literary and philosophical works. *I marmi* (*The Marbles*, 1552) gathers a series of dialogues, on various themes, by *Accademici pellegrini* or by ordinary Florentines. They are set on the marble steps (*i marmi*) of the cathedral of Santa Maria del Fiore in Florence. Through a very distinctive style, in his dialogues Doni expresses his literary inventiveness and his moral resentment of his contemporaries, as well as an acute reading of human instability and of the restlessness of human dispositions. Doni is convinced that men are inevitably trapped between their insatiable appetites and the vanities and frailties of their mortal being (Borrelli 2000). *I mondi* is probably Doni's most successful and best-known work. In his huge volume, "seven worlds" are imagined: the small, the large, the greatest, the mixed, the imaginary, the laughable, and the world of fools. It develops through these imaginary worlds that are discussed by different Members of the Accademia Pellegrina under pseudonyms. Social and moral criticism, together with moral advice, witty observations, and critique of man dominate a work that is significant for its inventiveness and imaginative style. The best-known dialogue is the one between two academicians named "Il Savio" (the wise man) and "Il Pazzo" (the madman), to whom Jove and Momus send the vision of a new utopian world. The ideal city they describe, in fact, is ruled by a communitarian utopia, most likely influenced by More's *Utopia*, and by the wise laws of Garamanti, the utopian people narrated in the *Relox de los Principes* (1529) by Antonio de Guevara. The use of Pazzia (Folly) to praise simplicity and authenticity is borrowed from Erasmus. While always maintaining his light and satiric tone, Doni gives voice to a critique of his contemporary society and to the desire for peace and the greatest possible degree of social justice. Doni's utopian city follows the typical model of the radical ideal city of Italian renaissance being "fabricata in tondo perfettissimo a guisa d'una stella" (fabricated in the perfect round shape of a

star). This is a rational utopia, in which conflicts are repressed through a strict regulation of the passions, from love to greed and religion, in a paradoxical order that converts itself into folly "onde, levate via le occasioni, ci sarebbe pochi pazzi, o noi saremmo tutti pazzi a un modo" (thus, having removed the occasions, there will be few madmen, or we all will be mad in the very same way).

It is been argued that Doni's view is profoundly different from that of the other renaissance utopians, for he belonged to a smaller group of social critics who, in their exasperation with the injustice of the social order, "rejected also the most of the values of Renaissance civilization" (Eliav-Feldon 1982: 21). In this sense, the scholar Giorgio Simoncini interpreted Doni's utopia as a utopia opposing the principles and values of courtly society and as being "against the prince" (Simoncini 1974). However, if Doni's utopia gives an answer to the aspiration for a new well-ordered world as a reaction to the decay of contemporary society, this new world reproduces the needs of social and political control expressed by princely and courtly literature. In his own ambiguous and contradictory way, Doni participates in the court ideology of his age. The political and social topographies of his utopia have the temple at their center and show a need for order, simplification, and coercion. However, his adherence to the literary universe of the court is constantly challenged by his unease with the injustice and corruption of contemporary society.

Anton Francesco Doni's humanism is thus the expression of a specific cultural world centered on the court and its artistic and social representation. However, he distinguishes himself from the most typical discursive world of courtly literature as he constantly moves from acceptance to a melancholic rejection of the court's values and orders. In this sense, it may be argued that his anxieties about and acquiescence toward courtly society, in their mutual interconnections, do express Doni's imbalance between the acceptance of a conventional social order and the social critique that is implied in his moral philosophy (Pissavino 1991).

Donne, John

Born: 22 January 1572, London, England

Died: 31 March 1631, London, England

Peter Craft

Felician University, Rutherford, NJ, USA

Abstract

This encyclopedia entry provides information about the life, heritage and rupture with tradition, and innovative and original aspects of metaphysical poet John Donne. Its purpose is to inform readers of how Donne, a Roman Catholic living in a time when his religion was considered "illegal," used his poetry to express how he attempted to live justly in an unjust society. While only his later works explicitly discuss the topic of religion, references and allusions to religion can be found even in his love poems. His belief in God was central to who he was as a person, and his fear of being persecuted for worshipping the same God, but in the outlawed branch of Christianity, permeated through this writing.

Biography

John Donne was born in London in 1572 to John Donne, of Welsh descent, and Elizabeth Heywood. His maternal lineage, as well as his parents' refusal to conform to the Church of

England, meant that Donne was a nonconformist from birth. In fact, Heywood's great-uncle was Sir Thomas More, recognized as a saint in the Catholic Church as well as a dissenter because of his refusal to acknowledge King Henry VIII as the head of the Church of England. Both his mother and father were considered "recusers," a position punishable by law. Donne's father died when Donne was only 4, and his mother married a wealthy doctor, adding three step-siblings to his 5 biological siblings (one of whom perished in jail for being a Catholic sympathizer).

Continuing with his reactionary beliefs and practices, Donne remained privately educated at schools like Hart Hall and Cambridge University; however, he left school before graduating because he did not want to take the Oath of Supremacy required by King Henry VIII. This act of refusal would have been considered treason, so he sacrificed his degree to honor his beliefs. In his post-collegiate life, he spent much of his inheritance and most of his time womanizing. Eventually, a few years later, he met and fell in love with Anne More. At the time he was working for the Lord Keeper of the Great Seal as his Chief Secretary, but he jeopardized his career when he secretly eloped with Anne. Anne's father was furious and had Donne arrested. He was imprisoned and subsequently lost his job.

Following his release (and the forgiveness of Anne's father), he took whatever job he could to support his wife and growing family. Anne bore 12 children, but ultimately only 7 survived. During this time, Donne and his wife relied on the charity of their friends and her family in order to survive. Donne could have accepted a position with the church and had gainful employment, but from 1614 to 1620 when offers were abundant, he resisted. Anne died delivering a stillborn baby in 1617, and in 1621, Donne accepted a job as Dean of St. Paul's Cathedral in order to support his children. Though he was a womanizer in his younger years, Donne vowed that he would never marry again and remained faithful to his wife despite her death.

Donne was a passionate writer, and the emotional highs and lows he experienced are ever-

present in his works. His content is classified as metaphysical, and he is known for his artful use of extended metaphors. Since he only authorized nine of his poems to be published in his lifetime, the dates of his works are uncertain. It is estimated that the elegies and *satires* were written in the 1590s. His poetry manuscripts were shared among the literary community, and he only gained fame posthumously. His originality lies in the fact that while he was a religious man, he often wrote of man's carnal desires. These themes were present in his initial works, but upon the death of his wife, his themes changed to a melancholic tone.

For example, assumed to be his first works are his elegies, which are about love and lust. Most famously, his poem "The Flea" employs an extended metaphor that requests his object of desire to consider having sex on the basis that a flea biting him and then her would be essentially like consummating their desire anyway. He argues that the lovers being bitten and their blood mixing together would be far worse than the act of sex. The metaphor in this particular poem is quintessential Donne: he connects the seemingly unrelated in a fanciful, inventive manner (Schoenfeldt 2019). As he matured, his poems showed an even more introspective side where he contemplated the unfairness of having to align with the Church of England.

Donne is among other famous metaphysical poets, such as Andrew Marvell and George Herbert; however, he is unique in that his content shows that humans can have complex, complicated feelings and relationships. For instance, he can fall in love with a woman, her body, and her soul all while remaining faithful to his religion. Once he found his true love, the woman who embodied all of the qualities in his love poems, he wrote more about his search for how to truly be faithful to God and religion as a practice. The anxieties he felt during his conversion from Roman Catholicism to Anglicanism are illustrated in his *Holy Sonnets*, where he explores the problem of faith in a tortured world (Eckhardt 2019). Donne fell ill with typhoid fever, and after his recovery, he developed stomach cancer. While ill, he wrote what many consider to be his own funeral sermon, *Death's Duell*.

Drebbel, Cornelis

Born: Alkmaar, 1572

Died: London, 1633

Vera Keller

Robert D. Clark Honors College, University of Oregon, Eugene, OR, USA

Abstract

An alchemist, inventor, engineer, and natural philosopher, Drebbel fits in the vernacular

maker's knowledge tradition (Smith 2004) during a period of changing status for meteorology and alchemy.

Alternate Names

[Drebbel, Cornelius](#); [Dremmel, Kornelis](#)

Biography

Drebbel began his career as an inventor and engraver, marrying the sister of artist Hendrick Goltzius. He and Goltzius also practiced alchemy, and Drebbel composed a natural philosophical work, *On the Nature of the Elements*. The first surviving edition is a German translation (Drebbel 1608). In 1604, Drebbel moved to Ipswich, England. In 1607, he offered King James I a “perpetual motion” device (Drebbel 1607). James assigned Drebbel to Prince Henry's service. Drebbel installed a complex of “perpetually” moving devices in Eltham Palace outside London, all sensitive to slight changes in temperature.

This was a period of rising epistemic status for the study of meteors, as scholars sought to identify consistent causality for impermanent phenomena and to use contrived demonstrations to measure and depict meteorologic change. Drebbel's theory of the origin of the winds, in which he was preceded by Giambattista Benedetti (1585), opposed dominant views (Borrelli 2008; Martin 2016). Drebbel's recognition of weather patterns was also significant (Dove 1866). Drebbel deployed his meteorological ideas in the design of his “perpetual motion” devices and “glasses of thunder and lightning,” as well as in his more utilitarian thermostatic oven, which engineers today consider a milestone in feedback control (Mayr 1970; Keller 2013b). His discussion of vital substances borne within the elements also contributed to debates concerning the “aerial nitre” (Keller 2013b).

Drebbel was invited to Prague to reproduce his perpetual motion for Rudolf II, a trip which coincided with Rudolf's death in 1612, and Drebbel's brief imprisonment,

followed by the death of Prince Henry (Jaeger 1922). The next 8 years saw straitened finances but fertile inventions, including the submarine, a new mordant for scarlet dye, a method of chemical air-conditioning, and various improvements to telescopes and microscopes. Drebbel's *On the Fifth Element* was published in Latin (Drebbel 1621). No surviving works relate closely to the inventions of this stage of his career, his optical writings having been lost (Keller 2008).

Around 1620 Drebbel met the Küffler brothers of Cologne in England. They peddled his microscopes and telescopes in France and Italy, married his daughters, and after his death, further developed his inventions, including the scarlet dye and an improved oven for drying malt. Drebbel also developed a relationship with the brothers Sir William and John Heydon, in the circle of Prince Charles (Keller 2012). With the support of Charles, William Heydon developed a plan for deploying Drebbel's submarine and air-conditioning in India in 1622. This plan was not realized, but Drebbel enjoyed renewed courtly employment (Keller 2013a). He worked for the Duke of Buckingham's building, gardening, and collecting project at New Hall in 1624 (McEvansoneya 1986). With the accession of King Charles I, William Heydon was appointed Lieutenant-General of the Ordnance Office, overseeing Drebbel's development of military technology. Drebbel traveled to France to serve as engineer in the battle of the Isle of Ré in 1628 and continued to serve in the Ordnance Office in the position of Chief Engineer until his death (Keller 2008).

Drebbel's career has been considered in light of Francis Bacon's *New Atlantis* (Colie 1954). Drebbel claimed to discover his ideas with "his own hands," through the use of "living instruments," but without difficult mathematics or lengthy writing. His texts proved popular, with twenty-six editions in Dutch, German, French, and Latin until 1785 and an enthusiastic reception within the new discipline of academic alchemy (Keller 2010). His modern reputation has been mixed, due to heated debates over his role in the invention of the thermometer, barometer, and

microscope, and in other discoveries (Naber 1907; Jaeger 1922).

Du Chesne, Joseph

Born: 1546, Lectoure (Armagnac)

Died: 20 August 1609, Paris

Miguel López-Pérez

Departamento de Historia Moderna, Universidad Complutense de Madrid, Madrid, Spain

Abstract

Joseph Du Chesne advocated for the fusion of chemistry and medicine, claiming that chemical medicine could offer substantial benefits to academic or Galenic medicine. This advocacy was contemporaneous with bitter controversies, ranging from the agitation of Paracelsus's followers to the rise of Spagyrist, and the debates over the need to purify Galenism. A backdrop to all of this was the changes in and growth of alchemy. Du Chesne proposed two things: first, a conceptual framework that would serve as the theoretical basis for chemical medicine and, second, a practical, demonstrative system, characterized by distillation. In addition, Du Chesne was well aware that he faced significant challenges in proposing his chemical innovations, but he persevered in

the hopes that his new medical system would gain adherents.

Alternate Names

[Quercetanus](#)

Biography

After studying surgery for 3 years at Montpellier (1564–1566), Du Chesne worked as an army surgeon in Germany. It was there that he came in contact with the Paracelsian movement and the work of Théodore Birckman. Birckman introduced Du Chesne to the Danish Paracelsist Petrus Severinus in Köln, and by 1573, Du Chesne was studying medicine in Basle. In 1575 he earned a doctorate under Jakob Zwinger (Gilly [1979](#), 57–137). After marrying Anne Trye, a Calvinist, in 1574, Du Chesne became a Calvinist himself and moved to Geneva. There, Du Chesne began practicing a form of medicine heavily influenced by alchemy and Paracelsism. At this point, he became involved in a heated controversy with Jacques Aubert, a dogmatic Galenist; the substance of the controversy had to do with the new Paracelsian medicine (Aubert [1575](#), 8; Aubert [1576](#)). In 1575 Du Chesne published his answer to Aubert, *Ad Jacobi Auberti Vindonis De ortu et causis metallorum contra chymicos explicationem Josephi Quercetani* (Quercetanus [1575](#)); this book marked Du Chesne's first step in reconciling Galenism and Paracelsism. One year later, he published *Sclopetarius* (Quercetanus [1576](#)), in which he advised the use of both chemical and traditional remedies. A decade later, in 1587, he published *Le Grand Miroir du Monde*, a long alchemical and philosophical poem, in which Du Chesne expounded on the intellectual bases of his alchemical ideas, as well as the relationship between medicine and alchemy (Hirai [2005](#); Kahn [2004](#)). Upon being named royal physician of Henry IV of France, he moved to Paris in 1596. From then on forward, Du Chesne practiced his particular form of medicine (Kahn [2007](#), 233–250). In 1603 he published *De priscorum*

philosophorum verae medicinae materia, where salt is identified as the key element in both medicine and alchemy (Queretanus 1603; Frankowiak 2010, 281–283). In addition, he made and developed a system to classify schools of medical thought and practice: “Hermétiques,” “Empiriques,” “Méthodiques,” and “Dogmatiques.” University medical faculty at Paris, headed by Jean Riolan, criticized and censored Du Chesne’s *De priscorum philosophorum*. Chemist Théodore Turquet de Mayerne was also swept up in the controversy. Both Du Chesne and Turquet de Mayerne received vociferous support from German physicians who attacked Riolan and the Parisian medical faculty; the controversy had escalated and become an international debate. In the end, Henry IV came to the defense of Du Chesne and Turquet de Mayerne, ordering the Parisian faculty to back down. In 1607, according to the royally mandated conciliation between Dogmatiques and Paracelsians, Du Chesne published his famous *Pharmacopea dogmaticorum restituta*. Du Chesne died 2 years later, on August 20, 1609.

Heritage and Rupture with the Tradition

Du Chesne’s life coincided with the rupture with dogmatic Galenism that has been called a Paracelsian revival (Debus 1977, 149–154). Defending several novel approaches (such as the use of chemical remedies, alchemical ideas, and distillation), Paracelsism broke with medical tradition. But Du Chesne’s embrace of chemical medicine did not imply a complete break with the classical tradition: he rejected many of Galen’s theories but reserved a special place for Hippocrates. This put him at odds both with Paracelsians and with Galenists.

To a great extent, Du Chesne advanced chemical medicine by providing it with a systematic framework that included guidelines and norms. In his rendering, chemical medicine was not merely alchemy, nor was it simply an elevation of Paracelsianism; Du Chesne’s chemical medicine was a universal system for the explanation of natural phenomena. He believed that even Galenists

should incorporate at least the use of chemical remedies, even if they rejected his theoretical bases. In the end, Du Chesne is notable for his work to reconcile academic, Galenic medicine and novel, chemical medicine. All this he did for the improvement of medicine.

Impact and Legacy

His *Pharmacopea dogmaticorum restituta* was reedited 25 times during the first half of the seventeenth century (Chesne et al. 1607). Du Chesne’s goals were largely realized, and chemical medicine became the principal avenue for the development of medicine broadly for a century. The impulse he gave to chemical medicine at the beginning of the seventeenth century bore fruit when chemistry became consolidated as a science during the early eighteenth century.

Du Pont, René

Born: Unknown

Died: Unknown

Simone Guidi

Sapienza Università di Roma, Rome, Italy

Abstract

A French polemicist of the first half of the seventeenth century. He was the author of

a *Philosophie des esprits* published in two editions (Paris 1602, Paris 1612), in which he defended and developed, in opposition to the materialists, the concept of intelligent spiritual substance. Du Pont's views were close to those of Marsilio Ficino and Pico della Mirandola, and he put forward a theory of human nature in the scholastic tradition, with strong influences from Hermetic, Augustinian, and neo-Platonic thought.

Innovative and Original Aspects

A French polemicist of the first half of the seventeenth century, Du Pont is known mainly as the author of a *Philosophie des esprits* published in two editions (Paris 1602) in which he defended and developed, in opposition to the materialists, the concept of intelligent spiritual substance. Here he took up Pico della Mirandola's anthropocentrism, putting forward a theory of human nature in the scholastic tradition, with obvious roots in the Hermetic, Augustinian, and neo-Platonic schools of thought. Du Pont was a fervent Catholic who on various issues fell into line somewhat uncritically with the Aristotelian-Scholastic orthodoxy. His work is nonetheless an original and deeply felt appeal for a spiritual life expressed through a theological account of spiritual realities, notably featuring angels, demons and blessed souls, and the rewards and punishments of the next world. Throughout his work Du Pont drew abundantly on the imagery of mysticism, neo-Platonism, and Augustinian thought, often taking positions close to those of the Italian Renaissance thinkers.

Du Pont's views are particularly well illustrated by the sixth book of his *Philosophie des esprits*, dedicated to the order that, in governing the universe, brings together all God's creatures under the sign of His omnipotence. Nature, he argued, considers and brings together within itself all the possible combinations and patterns of the living, in a kind of universal and reciprocal reflection of everything. That means, he says, that even living beings are connected to each other by a set of analogies and that even explains

the existence of mythological animals and other wonders and resemblances among living beings. By contrast, intellectual and angelic substances are quite unlike the bodily creatures living on earth. In this case too, proceeding from a tradition that we could trace back to Thomas Aquinas, spiritual and bodily creatures are the opposite sides of a contrasting and complementary polarity, characterized by completely different attributes.

Man, the point of connection in this cosmological dualism, is, as he had been in Pico's thinking, at the center, as a third element able to reconcile the contrast and as a microcosm summing up the whole variety of creation. From the point of view of his theory of mind, Du Pont draws on the hylomorphist tradition, but, as many sixteenth-century neo-Platonists had done, he revived various elements inspired by Platonistic or dualistic thinking (see Rodis-Lewis 1990) which he reconciled with the idea of a soul that was clearly identified as *forma corporis*. In line with Ficino before him (and with Pascal after him), Du Pont identified Man as an "animal and angel," a creature between sense and intellect. It should be noted, however, that to illustrate the spiritual nature of the soul, he recommends a particular thought experiment of "removal" of the body from the human combination that perhaps illustrates the transition that had occurred in the sixteenth-century Aristotelian theory of mind, a shift toward a kind of "moderate" and intellectualistic hylomorphism that looked with interest at the common spiritual nature of angels and souls. According to Du Pont, by imagining the body not existing, Man can know what it feels like to be pure intellect (as Aquinas, e.g., could not do, except as far as the first principles are concerned), which amounts to knowing what it feels like to be an angel.

Dupleix, Scipion

Born: Condom, 1569

Died: Condom, 1661

Violaine Giacomotto-Charra
 Université Bordeaux Montaigne, UFR
 Humanités, Pessac, France

Abstract

Scipion Dupleix was a magistrate born in the southwest of France and renowned for his historiography of the Bourbons. He was also a pioneer in the popularization of scholastic philosophy in France. Between 1600 and 1610, he produced four works, his *Logique* (Paris, Salis, 1600), *Physique* (Paris, Vve Salis et Sonnius, 1603, followed in 1604 by the *Suite de la Physique*, dealing with the question of the soul), *Métaphysique* (Paris, Vve Salis et Sonnius, 1610), and *Éthique* (Paris, Vve Salis et Sonnius, 1610), along with two other works, the first entitled *Les Causes de la Veille et du Sommeil, des Songes, de la Vie et de la Mort* (Paris, Vve Salis et Sonnius, 1606), inspired by Aristotle's *Parva Naturalia*, and *La Curiosité Naturelle Redigée en Questions* (Paris, Vve Salis et Sonnius,

1606), inspired by the *Problemata* genre and classifying each “problem” in alphabetical order, a singularly new idea at the time. These texts were later brought together and published under the title *Corps de Philosophie*. This was a commercial, mass circulation edition, free of royal censorship, first printed in Lyon by Rigaud in 1620 and subsequently in Rouen and Geneva. A further edition, entitled *Cours de Philosophie*, was published with the author’s approval by his customary publisher, Sonnius. Dupleix’s complete works met with resounding success up until 1645 and his *Curiosité Naturelle* was even translated into English (*The Resolver or Curiosities of Nature*, London, 1635).

Short Biography

Scipion Dupleix became an orphan at the age of 11. He was educated at the Collège de Guyenne, where he followed the teaching of Scottish scholastic philosopher Robert Balfour to whom he claimed he owed his learning. Contrary to popular opinion, he was not appointed preceptor to the Comte de Moret (there is no historical proof to corroborate this (Blanquie 2008a)) and did not embark upon his career in philosophy on the instigation of Queen Margaret of Valois, first wife of King Henry IV of France. Dupleix had published *La Logique* and *La Physique* before meeting her and put his work to good use in winning the Queen’s favors (Blanquie 2008a, 2008b). She took him into her service in 1605 and encouraged him to pursue his philosophical reflections. In 1619, he published his *Memoires des Gaules* and became king’s historian, in the service of King Louis XIII and Cardinal Richelieu. Despite the fact that he entered into the King’s service, he remained a magistrate until his death (he became “Premier consul” of Condom in 1626 and State Councillor).

Innovative and Original Aspects

Dupleix was both a philosopher and pioneering figure in the popularization of philosophy. In the

latter role, he was the first person to produce a complete work on scholastic philosophy in French that was more than the mere digest or abridged version like those hitherto penned by Noël Taillepied (*Œuvres de philosophie, à Sçavoir Dialectique, Phisique, et Ethique d’Aristote*, 1583) or Jean de Champaignac (or Champeynac: *Sommaire des Quatre Parties de la Philosophie, Logique, Ethique, Phisique et Metaphisique*, 1606). Dupleix was also keenly interested in pedagogical questions and takes great care to accompany his reader, even the novice, step by step down the path towards philosophical enlightenment. He coined or disseminated a number of philosophical terms in French directly borrowed from scholastic Latin and peppered his treatise with numerous quotations from Aristotle which he translated into French, at a time when not a single of the treatises of the *corpus naturale* had as yet been translated. His writing is characterized by the values of humanism and clearly expresses a desire to please those most bookish among his readers – his texts are enriched with snippets of Latin or Greek poetry, and he refers abundantly to the work of the great French poet Guillaume du Bartas who worked in the field of science in the 1580s (Balsamo 2004; Giacomotto-Charra 2014). Dupleix unites his desire to disseminate a philosophical train of thought, faithfully translating scholastic works and drawing its inspiration directly from Latin manuals, with that of striking a happy medium between the scholarly idiom of French philosophy and a more amiable style capable of winning over readers with no natural predilection for philosophy.

In many ways, Dupleix was a true philosopher. He resolutely adopted instrumental logic and, in his other works, made clear philosophical choices. He regularly (albeit not systematically) voiced his opposition to Thomist interpretations, preferring Duns Scot or Durand de Saint-Pourçain (Ariew 1992; Faye 1986, 1998). He discussed the philosophy of his day and was a vehement critic of Jean Bodin and his *Universae Naturae Theatrum*, integrating contemporary ideas on medicine formulated by Jean Fernel into his treatise and correcting Aristotle on certain points. He explored such questions as

metempsychosis and demonomania, thereby directly responding to commonplace concerns of his day. While Roger Ariew considered him a scholastic philosopher, in *Wonder and the Order of Nature*, L. Daston and K. Parks regarded him as a preternatural philosopher, providing ample proof if any were needed that his philosophy, hitherto so little studied, is worthy of far greater exploration.

Duplessis-Mornay

Born: Buhy, 5 November 1549

Died: La Forêt-sur-Sèvre, 11 November 1623

Hugues Daussy

Centre Lucien Febvre, Université de Bourgogne
Franche-Comté, Besançon Cedex, France

Abstract

Philippe de Mornay is Lord of Plessis-Marly, called Duplessis-Mornay or Du Plessis-Mornay, and baron of La Forêt-sur-Sèvre (Buhy, 5 November 1549, to La Forêt-sur-Sèvre, 11 November 1623). He is a Huguenot diplomat, polemicist, man of letters and theologian who devoted his life to the defence and promotion of the Reformation in France and Europe.

Biography

French gentleman born in a catholic family, Philippe Duplessis-Mornay made his conversion to Calvinism when he was still a child, after the death of his father and under the influence of his mother. He received a good education which ended by a “grand tour” through Europe. Well integrated in an international protestant network, he was at first a theologian, but in order to promote the French protestant cause, he moved to a political action. After the Saint Bartholomew's Day massacre, which he miraculously escaped, he took his part in the elaboration of monarchomach thought, writing one of its most important treatise, the *Vindiciae contra tyrannos*. He entered then in the service of the king Henry of Navarre and developed a less subversive political thought, writing tens of pamphlets in order to defend the

rights of his master to the throne of France and the right, for the Huguenots, to get a legal status allowing them to live in the realm of France. After his disgrace, in 1600, he remained a major leader of the Huguenot movement.

Two clearly distinctive aspects can be perceived in the political thought developed by Duplessis-Mornay. The first is his secret involvement in the monarchomach movement. Recent researches tend to prove that he was the real author of the *Vindiciae contra tyrannos*, first published in 1579 under the pseudonym Stephanus Junius Brutus but written a few years earlier. In that treatise, Duplessis-Mornay developed the theory of the contract between the people and the prince founded on the sovereignty of the people given by God. The conditional obeisance to the prince, submitted to the respect, by him, of the terms of the contract, allowed the magistrates leading the people to destitute the prince in case of tyranny. The regicide right was strictly limited to a fight against a tyrant who usurped his power. The authorship of this very subversive treaty has never been recognized by Duplessis-Mornay.

The second dimension of his political thought also has an innovative dimension, but without any subversive aspect. Simultaneously, he fought for the accession to the throne of France of the protestant first prince of the blood, the king Henry of Navarra, who became Henry IV, king of France, in August 1589, and for the defense of the Huguenot minority. His reflection was based on the absolute defense of the Salic law, a fundamental law of the realm, which had to prevail on any religious consideration. He tried to demonstrate that the religion of the prince had no importance in the process of succession, which had to remain only politic. He thus worked in favor of the separation of the political and religious spheres, which were absolutely confused. His effort in that way played an important role in the process of negotiation and elaboration of the Edict of Nantes which was the concretization of the distinction, in each person, of the citizen as the political personality and the Christian as the religious personality.

During his whole life, Duplessis-Mornay was in close relation with the most important

protestant theologians and philosophers of his time. Above them, we can quote François Hotman, who developed a similar thought on many subjects, or Theodore Beza. But he was also in touch with many diplomats, like Hubert Languet, statesmen and princes, as well as with catholic writers as Michel de Montaigne.

Dupuy, Claude

Born: Paris, 1545 [bap.: 13 August 1545]

Died: Paris, 1 December 1594

Shanti Graheli

University of Glasgow, Glasgow, UK

Abstract

Claude Dupuy was a jurist, a humanist, and a bibliophile (Dupuy et al. 2001). He trained in Paris under prominent scholars like Jean Dorat, Adrien Turnèbe, and Denis Lambin, completed his studies in jurisprudence at the University of

Toulouse, and was a pupil of Jacques Cujas in Bourges. He travelled in Italy between 1570 and 1571. Gian Vincenzo Pinelli in Padua, Carlo Sigonio in Bologna, and Fulvio Orsini in Rome were among the most important connections he made during this time. He was based in Paris for most of his professional life, mixing his duties at the *Parlement* as *avocat* and later *conseiller* with his passion for the letters. He was of a sickly constitution and died of kidney stone disease at 49 years of age. His wife Claude Sanguin bore him eight children, two of which, Pierre and Jacques, were prominent bibliophiles in the Parisian circles of the seventeenth century.

Alternate Names

Puteanus

Biography

Claude Dupuy was born in Paris in 1545, the eldest child of Clément Dupuy and Philippe Poncet. His father was a lawyer, originally from the Forez region, who had moved to Paris in his youth. His mother came from a prominent Parisian family. Clément Dupuy died in 1554, leaving his wife and three children under the protection and support of eminent figures such as Cardinal François de Tournon and Ippolito d'Este (Delatour 1998). Being of frail constitution, Claude was more naturally led to studying than to physical exertion (Delatour 1998). He grew up having access to the circle of Paris humanists, such as Jean Dorat, Adrien Turnèbe, and Denis Lambin; he was initiated early to the study of Greek, and completed his humanities education by the early 1560s. He completed his studies in jurisprudence in Toulouse and followed the lectures of Jacques Cujas in Bourges. By the end of 1566 he had been appointed a lawyer of the *Parlement* of Paris.

Familiarity with the great humanist circles in Paris nurtured Dupuy's interest in Classical Antiquity and philology. In 1570 he undertook the then

traditional *voyage d'Italie*, provided with letters of introduction and a well-trodden itinerary including Venice, Padua, Bologna, Rome, and Florence among his destinations. In Venice he met Aldus Manutius the Younger; their exchanges left a trace in the editions published by the Aldine Press in the following months, acknowledging Dupuy's assistance (Delatour 1998). In July 1570 Dupuy was in Padua, where he met Melchior Wieland (director of the botanic gardens), renowned physician Girolamo Mercuriale, and he became fast friends with the great bibliophile, Gian Vincenzo Pinelli. Their long-lasting correspondence is representative of their efforts in seeking and correcting ancient and modern texts (Dupuy et al. 2001; Lastraioli 2001). Dupuy met Carlo Sigonio in Bologna, strong of a letter of introduction signed by Pinelli, and later continued his journey to Rome, where he spent the remaining months of his Italian tour. There he had the opportunity to use the Vatican Library, collating the works of Sallust, and private libraries such as that of Fulvio Orsini (Delatour 1998). He also followed the lectures of Marc-Antoine Muret in November 1570. On his return journey Dupuy stopped in Florence, where he met Piero Vettori, this time recommended by Fulvio Orsini.

Thanks to the contacts he made in Italy, Dupuy was now able to rely on an extensive epistolary network, to which were added in the following years important names such as Joseph-Juste Scaliger, Jacques-Auguste de Thou and Jacopo Corbinelli (Calderini De Marchi 1914). In 1575 he was made *conseiller au Parlement de Paris*, taking the office of Jean Morelet du Muiseau (Delatour 1998; Dupuy et al. 2001). He married a niece of Christophe de Thou, Claude Sanguin, who bore him eight children. Among them, the most prominent were Pierre (1582–1651) and Jacques (1591–1656), who followed in their father's steps as bibliophiles. Pierre was born in Agen in late 1582, when Claude and his wife were travelling throughout Guyenne on his assignment for the chamber de justice at Bordeaux, Agen, Périgueux, and Saintes. As well as keeping faith with his professional engagements, Dupuy also took this

opportunity to strengthen his ties with the humanists of the south-west (Delatour 1998).

With the aggravation of the political turmoil in France, Dupuy took refuge in his studies and his garden; having close friends among both the Catholic and the Huguenot parties, he took no sides for one faction or the other (Delatour 1998). As the city of Paris fell into a state of disarray during the War of the Three Henrys (1587–1589), several magistrates of Dupuy's standing were rounded up by the Catholic League's forces and taken to the Bastille. Dupuy himself was imprisoned for over 2 months, a sore trial given his bad health (Delatour 1998; Dupuy et al. 2001). In the summer of 1589 he took his family to safety to a property in the country owned by his brother-in-law, Claude Séguier; here his wife gave birth to their seventh child, who did not survive. The last period of Dupuy's life was characterized by financial difficulties and ill health. He was reinstated to his former office after pledging his disassociation from the Catholic League, and he was present at the crowning of Henry IV in Chartres in February 1594. The king entered Paris in March 1594. Dupuy did not live long to enjoy the newly restored peace and died of kidney stone disease on 1 December 1594.

Duran, Profayt

► [Duran, Profiat](#)

Duran, Profiat

Born: Perpignan, c. 1355

Died: Valencia, 1433 (?)

Maud Kozodoy
New York, NY, USA

Abstract

Profiat Duran was a fourteenth-/fifteenth-century Jewish polymath who was born in Aragon/Catalunya and was forcibly converted to Christianity during the 1391 Iberian anti-Jewish riots but continued writing in Hebrew, including anti-Christian polemics.

Alternate Names

[Efod](#); [Efodi](#); [Bonafide](#), [Honorat](#); [de Bonafide](#), [Honoratus](#); [ha-Levi](#), [Isaac ben Moses](#); [Duran](#), [Profayt](#)

Biography

Born most likely in the mid- to late 1350s, Profayt Duran lived in Perpignan and worked as a physician. He wrote exclusively in Hebrew, but must have spoken the local vernacular, Catalan, and could read Latin. Forcibly converted to Christianity around 1391, Duran took the name Honoratus de Bonafide; afterward he wrote in Hebrew under the pen name “Efod.”

Duran studied and privately taught astronomy, medicine, mathematics, and philosophy, producing notes on the first book of Ibn Sina's *Qanun fi-l-tibb* (*Canon of Medicine*) and a well-known Hebrew commentary on Moses Maimonides' *Guide of the Perplexed*. He did not compose original astronomical works but was technically and theoretically proficient; he did compose a commentary on Ibn Rushd's *Abbreviation of the Almagest*, comparing it with a “Correction” of the *Almagest* by Jabir ibn Aflah, and criticized a fourteenth-century work on theoretical astronomy by Joseph ibn Nahmias.

In 1393, Duran wrote a funeral eulogy for a rabbi who had perished in the 1391 riots. There he asserts that although the outward deeds of his fellow forced converts might be characterized as idolatrous, their hearts were pure – and they therefore merited redemption along with the rest of the Jewish people. Two years later, Duran wrote *Heshev ha-Efod* (*Cincture/Computation of the Efod*), a concise elementary work on the astronomical concepts behind the Jewish calendar, reconciling rabbinic sayings with current astronomical knowledge.

Best known among his post-conversion writings are two anti-Christian polemical works: *Al tehi ka-avotekha* (*Do Not Be like Your Fathers*, c. 1395), a sarcastic epistle of “praise” that actually pours scorn on a recent voluntary convert to Christianity, attacking the irrationality of Christian dogma and pointing up the absurdity of a philosophically educated Iberian Jew converting to a religion based on faith rather than reason, and *Kelimat ha-goyim* (*Shame of the Nations*, c. 1397), a serious historical and textual critique of contemporary Christianity as a corruption of Jesus' words and life, from the perspective of the historical development of religion.

The *Ma'aseh Efod* (*Work of the Efod*, 1403), Duran's most important work, is a treatise on Hebrew grammar. It argues that, as against the obligation to observe ritual practices, the ultimate purpose of Jewish religious life is to study and internalize the Hebrew Bible and its grammar. Duran offers an entire curriculum of study as well as advice for pursuing it, touching as well upon the origin of Hebrew, the place of Hebrew

Scripture in the order of the universe, and the potency of words – in particular the Tetragrammaton – in the working of miracles. As he conceived it, reading, studying, fully understanding, and remembering the biblical text, or select parts of it, can provide the means of attracting divine emanation and divine providence and of atoning for transgressions. The salvific powers of the Bible are not limited to those persons able to apprehend the meaning of the text on the highest intellectual level; it is a source of salvation even for those who do not or cannot fully understand it. Duran's reshaping of Judaism as a system of intellectual meditation on divine texts, functioning by means of an occult virtue, bears distinct similarities to Jewish and Christian magical thought of the late-medieval Iberian and southern French world.

At some point after his conversion, Duran spent time in Navarre and Italy; he returned to Perpignan in 1411. The following year, he was a minor participant in the Compromise of Caspe. A *magister in medicina Honoratus de Bona Fe* registered his will in Valencia on May 26, 1427, and died there January 20, 1433.

Dürer, Albrecht

Born: 21 May 1471

Died: 6 April 1528

Giovanni Maria Fara

Ca' Foscari University of Venice, Venice, Italy

Abstract

We have a large amount of documents concerning Albrecht Dürer, one of Renaissance Europe's most important artists, an amount which is much more significant than that concerning any other German artist of the time and comparable to the amount available about Italy's great masters of his time, such as Leonardo, Raphael, and Michelangelo. Engraver, painter, and art theorist, Dürer has left us about a thousand drawings, as well as about 300 prints, a little less than 200 paintings, three amply illustrated treatises on art theory and a large body of theoretical studies more or less linked to the drafting of these treatises.

Biography

Dürer was born on May 21, 1471 in Nuremberg, the city to which his father Albrecht the Elder (1427–1502) had moved 16 years earlier in order to exercise his goldsmith profession with more and more success. Dürer's initial training was with his father. However, in 1486 he had already moved into Michael Wolgemut's (1434–1519) workshop, Nuremberg's most famous painter and engraver at that time. Dürer stayed in Wolgemut's workshop until 1489, perfecting his training and collaborating to drawing some of the illustrations contained in *Liber chronicarum* by Hartmann Schedel. Afterward, between April 1490 and May 1494, Dürer was engaged in a series of travels along the Rhine, still partly mysterious because of the very little surviving documentation. He stayed with certainty in Colmar, Basel, and Strasbourg. In this decisive

period, the young artist came into contact with the art of Martin Schongauer (c. 1450–1491), the master who had revolutionized German painting and engraving in the last quarter of the fifteenth century, and with Basel's and Strasbourg's leading typographers. Between 1494 and 1495, he completed his training and education, studying the Italian art of the time: a number of drawings, accurate copies of Italian models (Andrea Mantegna, Antonio Pollaiuolo, Lorenzo di Credi, Gentile, and Giovanni Bellini) date back to this period.

The obvious influence of these models, which led to a substantial change in Dürer's art style, led scholars of the second half of the nineteenth century to believe that Dürer had spent a short amount of time in Venice between the autumn of 1494 and the spring of 1495. However, this fact is still debated, since Dürer could also have received these decisive Italian art influences in Nuremberg through the mediation of prints and drawings, whose trade was widespread north and south of the Alps at that time. From the spring of 1495 until his death on April 6, 1528, Dürer kept a workshop in Nuremberg, a city which he left only in a few significant occasions, among which a long, essential, and well-documented stay in Venice between the late fall of 1505 and January of 1507 (from Venice the artist then travelled to Bologna, Ferrara, and probably Padua) and an equally long and important journey to the Flanders and the Netherlands in 1520–1521, during which he wrote a detailed diary which has fortunately survived to this day.

Dürer had direct relationships with leading Nordic humanists: citizen and imperial counsellor Willibald Pirckheimer (1470–1530), with whom he had the friendship of a lifetime, with very important effects on his engraver, painter, and most of all art theorist activity; lawyer Christoph Scheurl (1481–1542), whose works are a primary source for the reconstruction of a proper biography of Dürer; Pope Alexander VI's bedroom master and, later, canon of Bamberg Lorenz Beheim (c. 1457–1521), who wrote Dürer's first horoscope; poet Conrad Celtis (1459–1508), who

celebrated him as the new German Apelles; and philosopher Erasmus of Rotterdam (1466/1469–1536), who, after being portrayed in a touching pencil drawing as well as in a famous engraving, supplied the first incisive praise of Dürer as an engraver.

In 1525, in his workshop in Nuremberg, Dürer printed the *Unterweisung der Messung*, the Course in the Art of Measurement with which he began the publication of his art theory, a book for practical use and not a treatise on pure mathematics. The *Unterweisung der Messung* “served, so to speak, as a revolving door between the temple of mathematics and the market square. While it familiarized the coopers and cabinetmakers with Euclid and Ptolemy, it also familiarized the professional mathematicians with what may be called ‘workshop geometry’” (Panofsky 1943). Two years later, in October 1527, Dürer printed his military architecture text, one of the first books on the subject (*Etliche Unterricht zu Befestigung der Stett, Schlosz, und Flecken*, <https://books.google.com/books?id=JyS5-tUNtskC>), and in November of the following year, about 6 months after his death, came his essential treatise on the proportion of the human body (*Vier Bücher von menschlicher Proportion*). This vast *corpus* of theoretical treatise – which Dürer had started drafting much younger, immediately after returning from his travel to Italy in 1505–1507 – was immediately translated into Latin and printed from 1532 on in Nuremberg (at the home of Dürer’s widow, Agnes) and Paris (in Christian Wechel’s workshop). In just 3 years, a new and impressive Latin-written work by “Albertus Durerus” was ready to be widely read and studied throughout Europe, until the end of the seventeenth century.

For the first approach to Dürer’s vast bibliography, the following sources can be consulted: Mende (1971) and Hutchison (2000); moreover, the following bibliography is available online: http://duerer.gnm.de/wiki/Dürer-Bibliografie_nach_1971. More recent and updated biographies are Hutchison (1990) and Rebel (1996).

The following classic monographic works can also be consulted: Thausing (1884), Wölfflin (1926), and Panofsky (1943). Recent studies are *The Essential Dürer* (Silver and Smith 2010) and

Smith (2012). The catalogues of two important exhibitions held at Nuremberg’s Germanisches Nationalmuseum are also essential: *Albrecht Dürer 1471–1971* (1971) and *Der frühe Dürer* (2012). The most important catalogue *raisonné* of the artist’s drawings is still Winkler (1936–1939), only partially integrated by Strauss (1974). The most thorough catalogue of Dürer’s paintings is Anzelewsky (1991). As for printed work (prints, prints bound in volumes, illustrated treatises), the following publication is now available with broad and inclusive references to previous catalogues: *Albrecht Dürer. Das druckgraphische Werk 2001–2004*. The standard edition of the artist’s many manuscripts is contained in *Dürer. Schriftlicher Nachlaß* (Rupprich 1956–1969). In English language is now available: Ashcroft (2017). Dürer’s impressive success in Europe, namely, the varied reception of his art during the Renaissance and the Baroque period has been the subject of many recent publications, among which: Fara (2007), Dürer and Bartoli (2008), Vogt (2008), Grebe (2013), and Fara (2014).

Ebu's-su'ud

Born: 30 December 1490 [?], Müderris, near Istanbul

Died: 23 August 1574, Istanbul

Marinos Sariyannis
Institute for Mediterranean Studies/FORTH
(Foundation for Research and Technology – Hellas), Rethymno, Greece

Abstract

Ebu's-su'ud, son of Mehmed son of Mustafa al-ʿImad (Müderris, near Istanbul, 30 December 1490 [?]-Istanbul, 23 August 1574), was one of the most prominent Ottoman jurists and contributed greatly to what we came to regard as Ottoman law.

Biography

Son of an Anatolian scholar and dervish with strong links to the Ottoman palace and intellectual elite, Ebussuud studied under his father and other scholars and begun his own teaching career in

various *medreses* in Istanbul, Bursa, and other towns from 1516 on. In 1527/1528 he became a teacher in the *Semâniye* medreses in Istanbul, the highest educational post at the time, and then jumped to the judicial career with his appointment as judge of Bursa in 1533. Only 6 months later he became judge of Istanbul and 4 years later military judge (*kazasker*) of Rumili. Finally, in 1545 Ebussuud was appointed by the Sultan Suleyman the Magnificent as *şeyhülislam* or chief *müfti*, i.e., the head of the religious hierarchy who gave definitive responsa (*fetva*) on questions regarding the Holy Law. He kept this post under two Sultans till his death in 1574. Apart from his *fetvas*, which virtually formed Ottoman law in the Suleymanic era, Ebussuud also wrote commentaries on juristic issues and the Quran, as well as legal treatises.

Heritage and Rupture with the Tradition

By the time Ebussuud became *şeyhülislam*, there was already a huge literature on *fiqh* or Islamic jurisprudence regulating everyday aspects of the *şer'iat* or Holy Law; on the other hand, Ottoman Sultans from the late fifteenth century onward had issued several codes of law (*kânûnnâmes*), especially on landholding, tax, and penal issues, which in various ways departed from the precepts of the *şer'iat*. Ebussuud's task became to reconcile the religious law with the *kanun* or secular law, in order to produce a coherent body of legal precepts which would respond to the needs of a quasi-feudal

empire as the Ottoman was in this period. In practice, what Ebussuud did was to create Islamic foundations for a secular legal building, i.e., to provide justifications based on *şer'iat*-based stratagems and precepts for institutions and practices which had a clearly secular basis; the emphasis on the enhanced authority of the Sultan was facilitated by Ebussuud's redesignation of the former as Caliph. Moreover, Ebussuud's rulings had often clearly political goals, justifying the Sultan's policies in various disputable issues (such as the executions of Princes Mustafa in 1553 and Beyazid in 1559, or the breaking of the peace treaty with Venice in 1570).

Innovative and Original Aspects

Ebussuud brought important transformations in the posts he served: as a *Rumili kazaskeri*, he organized the system of rotation and promotion of judges, which prevailed for the period to come; as a *şeyhülislam*, he institutionalized this office and the production of *fetvas*. His most important contribution, however, was the identification of Sultan's rule with the rule of *şer'iat* and of the Sultan as a guardian of the faith and of the Holy Law; under his rulings, the competence of judges was to depend on the Sultan who appointed them, and thus their applying the *şer'iat* was bound to the Sultan's directives. With his legal devices, and in close collaboration with Süleyman (and perhaps less with his successor, Selim II), he legitimized current Ottoman practices under Islamic terms. In landholding, Ebussuud established state ownership over the land (a key notion for the Ottoman feudal and taxing system) using an elaborate distinction between *dominium eminens* and possession and usufruct and redefined the relevant terminology (and taxation) on the basis of traditional Hanefi theorizing on rent and loan.

As for religious endowments (*waqf*), he argued that the Sultan maintains the ultimate control over the endowed land, but also defended the legitimacy of donation of cash, i.e., of using lending money with interest for charitable purposes. Ebussuud's arguments in this case are of special interest: he stressed that such endowments had

been legitimized by constant usage for centuries and also that a possible annulment of these established endowments would jeopardize the welfare of the community. On this issue he embarked on a bitter debate with Birgivi Mehmed b. Pir Ali (1523–1573), a scholar who insisted that such endowments would constitute usury and thus should be condemned (another issue of debate with Birgivi was Ebussuud's permitting remuneration for religious services).

Impact and Legacy

Ebussuud's legal edifice dominates over Ottoman law of (at least) the century following his death, all the more so since his period came to be considered a "Golden Age" for the empire, deviations from which were held responsible for any signs of "decline." Only in the 1670s, under the influence of Birgivi's successors (the followers of Kadızade Mehmed, q.v.), did the Ottoman administration begin to experiment with a revival of purely Islamic law, especially in land and taxation systems.

Economics, Renaissance

Germano Maifreda

Università degli Studi di Milano, Milan, Italy

Abstract

How did Western economic learning come to claim the status of a separate discipline? When – and how – did it begin to define and organize its own field of specialization, vocabulary, areas of interest, and methods of study? What kind of methodological problems were raised by the attempt to make economic knowledge a real science? In order to answer these questions, this chapter suggests that we need to resist the temptation to treat the Renaissance as a mere repository of “premises,” “forerunners,” and “anticipations” of the present discipline of economics. Instead, the discontinuity between Renaissance and modern economics, as well as the culturally fragmentary nature of the Renaissance “economic” knowledge, will be emphasized. Rejecting the conventional narrative that takes for granted a homogeneous and necessary development of modern “economic thought,” it is maintained that this notion is a cultural artefact constructed by choosing, among various past “economic” discourses, those on which our present reality casts a false glow of inevitability.

Synonyms

[Economie](#); [Economy](#); [Oikonomia](#)

Methodology

We can define “economic knowledge” as the body of attempts to furnish a fairly general view of the functioning of economic life in society. Joseph A. Schumpeter (1981, 2) defined “History of Economic Analysis” as “the history of the intellectual efforts that men have made in order to *understand* economic phenomena or which comes to the same

thing, the history of the analytic or scientific aspects of economic thought.” This interpretative ambition also distinguishes economic knowledge from the mind-sets brought into play by the separate groups – merchants, farmers, laborers, and consumers – historically engaged in acts of production, exchange, and consumption, for these figures did not intend to interpret economic life as a whole; they meant simply to act in ways which may be judged economically important according to specific theories or points of view.

Inevitably, any attempt to study the forms which economic knowledge took in Western culture between the Middle Ages and the early modern era is conditioned by the forms and methods the field assumed in mid-eighteenth century, when it became a distinct discipline among other human and social sciences. The intellectual operation fixing the premises which led to its classification as a science is in some measure conditioned by what that science has become today, so it is difficult to resist the temptation to pick and choose from among past economic discourses those which are closest to, or perhaps overlap with, positions espoused by economists of our own time.

It is almost inevitable that if one takes a narrow neoclassical view of economics, equating it with the study of competitive market prices, one will not find any “economic” knowledge in the Renaissance (Ekelund and Hébert 1999). But the privileged theories and objects of today’s economic debate (production and the exchange of goods and services, effects of public policies and expenditure on the distribution of income, causes of unemployment, determinants of richness or poverty of some countries, origin of trade flows, and so on) are such precisely because a specific discipline – economics – has chosen, and distinguished, them from other theories and social phenomena. It is well known that the term “economics” has been used in English since the 1890s; before then, the name commonly used was “political economy,” indicating “the connection between the study of the economy and the political life and institutions of society” (Sandmo 2011, 3).

Textbooks, even when they admit that descriptions and analyses of the economic organization

of society and of economic decisions can be traced far back in history, usually begin with a short bird's-eye view on economic thought before Adam Smith ("pre-Adamite," in the words of Mark Blaug (1997, 10)), the aim of which is to identify a selection of various views or "schools" presenting the functioning of an economic system or a set of economic policy prescriptions. The attention of such research, moreover, is almost always concentrated on the strictly logical and argumentative dimension within a rather rigid canon of authors, works, and theories (Psalidopoulos 2000), under the assumption that this canon gradually developed into classical and postclassical theories of political economy. This approach does not, however, fully resolve the historical and cultural problem posed by the "origins of scientific economics" (Letwin 1963).

With reference to the Middle Ages, Joel Kaye (2000, 14) has had the merit of emphasizing how scholastic natural philosophers began to create a new model of nature, one that could explain the order and logic of the marketplace – "dynamic, self-equalizing, relativistic, probabilistic, and geometrical . . . It was within the new model of nature that science emerged." Terence Hutchinson's seminal book (1988, 14–24), in turn, identified throughout the seventeenth and eighteenth centuries two distinct streams of economic "thought and literature" which "flowed mainly independently of one another": the mercantilist literature on current policy problems and the ideas of the natural law philosophers, which introduced the concepts of natural order and natural law and contributed to the formation of value and price theory. Another interesting approach, following Emil Kauder (1965) and Albert Hirschman (1997), consists of inquiring into the genealogy of single economic principles, placing axiomatic choices in their historical and philological context.

The relationships which these research agendas set up between that culture and the economic science that took shape between the eighteenth and nineteenth centuries might be defined, in Michel Foucault's (1966) terms, as archaeological: just as someone uncovering the remains of a Roman basilica below a Christian cathedral is led to examine the nature of the basilica in question

and the relationship between the two human constructs, the reader of this chapter will be referred back to a period in which some of the *topoi* of what would become political economy, and later economics, were slowly taking on the visible traits of objects of study and observation.

Heritage and Rupture with the Tradition

Iconology, or a Description of Universal Images (Iconologia, overo descrizione dell'immagini universali), an influential encyclopedic repertoire of human images personifying abstract concepts, composed by Cesare Ripa (1593) as an aid to artists and printed in Rome, had no image for economy. Only in the revised 1603 edition, consulted by Jan Vermeer and the artisans decorating Versailles, was "economy" offered: a "matron of venerable mien, crowned in olive leaves, holding in her left hand a compass, and in her right hand a wand, and having by her side a rudder." This, Ripa advised, was her aspect "for the happiness of common political life requires the union of many families, which live under shared laws and with them govern themselves." And since "for each family to support itself with proper decorum, it needs laws that are more specific and limited than universal [laws]," the "private order of family government is passed on to us in a word that comes from the Greeks – Economy" (ibid., 118). The familiar dimension of the word-concept "oikonomia" induced Ripa to suggest that artists who might wish to represent it should portray the profile of a mother "with the wand signifying the authority the householder has over servants and the rudder signifying the care and guidance a father must exercise over his children." The "olive chaplet" with which the woman was crowned further showed that "the good economist must of necessity keep the peace in her home. The compass marks how much each person must measure his forces and, govern himself accordingly, in spending as in other things, to support his family and perpetuate it through careful [management]." Guidance, consensus, and measure, these were the characteristics of all good economy, and in virtue of this, "it is to be pictured as a matron, almost as

if that were the age most apt for the government of the household, because of the experience she has of worldly things" (ibid., 118–119).

This iconographic stereotype, inasmuch as it is an image created for immediate identification, offers us the contemporary sense of the term at its most banal and usual. Its origins are to be found in chapters eight, nine, and ten of the first book of Aristotle's *Politics* and in the fifth chapter of the fifth book of his *Nicomachean Ethics*. Xenophon had also contributed to this view with the *Economicus*, and so, too, had the pseudo-Aristotelian *Oeconomica*, along with the treatises on agriculture by Cato, Varro, and Columella, as well as Pliny the Elder's *Natural History* (Brunner 1968). The belated inclusion of a personification of economy in the *Iconography* also suggests the lack of popularity of the term, chiefly employed among scholars and in learned treatises. In the second half of the fifteenth century, Marsilio Ficino (1548, 62) wrote to Angelo Poliziano that he had set out an *Economia*, the structure of which must have been quite similar to the one proposed in Giorgio Valla's appositely entitled *On Economy, or Domestic Administration* (*De æconomia, sive administratione domus*) (1501), which was part of his general encyclopedic system *Of the Things to Pursue and Those to Avoid* (*De expetendis et fugiendis rebus*) composed in the same period.

The place assigned by High Renaissance culture to economy within the realms of knowledge was, then, that of a branch of "real, practical, philosophy," as the Florentine humanist Benedetto Varchi (1841, 763) explicitly stated:

Real, practical, philosophy is divided into two principal parts. The first and more worthy is called practicable, treating things that are not necessary – and consequently incorruptible and eternal – as real contemplative philosophy does, but things which are contingent and made by men – and consequently may or may not be; and this part is, in turn, divided into three parts: Ethics, or Morality, which considers chiefly the habits of a single person; Economy or Familial, which teaches how a father should govern his household; the third and last [part] is called Political, that is Civil, and declares the way in which states and republics should be maintained and governed; and this is nobler than the other two and is commonly called civil science and, in a single word, prudence.

So, the traditional etymology of the word "economy" continued to be current. In 1583, Tommaso Garzoni's notorious *Universal Marketplace of Every Profession on Earth* (1996, I, 386), though aspiring to present an authoritative *summa* of all the arts, crafts, and occupations of the time, still advised its readers that "the economy is nothing other than a discipline pertinent to the correct and worthy government of one's own family or what one has taken on as one's own." And economists are "those who follow with attention the care and government of their own households, so that they become capable of political and civil administration." As late as 1650, the *Summa politica* written by the Portuguese Sebastian Cesar (1650) gave a reading of *The Prince's Economy* based on Renaissance display and liberality. This conception is shared by a number of tracts on domestic economy of the same period; among these is Giovanni Battista Alessandri's (1616) *Regarding Economy*, which counsels generosity to its readers and censures those who "in bestowing" feel "displeasure, as the illiberal and the avaricious are wont to do" (Guerzoni 2007, 60). These recommendations are based on the conviction – which in 1635 Leone Zambelli stresses in *The Wise Man Industrious in Economy* (*Il savio industrioso nella economia*), a project for the education of noblemen dedicated to Odoardo I Farnese – that the dichotomy between "raison d'état" and "economia" in the domestic management was only formal. The activity of the prince, as "head of the family" and as ruler, must rest on the same value system. Therefore, education combined the two areas of activity (raison d'état and "economia") indicating the same moral attitude toward both as proper behavior for the young man being formed.

Innovative and Original Aspects

Minute and apparently secondary linguistic developments signal the way in which the declensions of *oikonomia* in the early modern period produced semantic vibrations, metaphors, and rhetorical strategies which were still instable and in evolution. Even where the "economic" lemma seemed

to hit on meanings which seem familiar, its echoes and shadings refer us back to less evident substrata of discourse and epistemology. Let us then try now to broaden the scope of our observations, noting that such transformations mature in contexts of discourse that are strongly diversified.

We should first recall that Christian theology had, from the start, used the word *oikonomia* in the context of one of the two interpretative paradigms dominating the reading of political relationships. The first of these paradigms was political in the strict sense since it was primarily public, situating in the one God the transcendence of sovereign power. A second paradigm of economic theology coupled to the first conception was the idea of an *oikonomia* conceived as immanent order, in divine as well as human life. The contemporary philosopher Giorgio Agamben (2011) has argued that political philosophy and the modern theory of sovereignty derive from the first paradigm; in the second, instead, he finds the roots of a genealogy leading to modern biopolitics, that is, the affirmation of discourses and techniques aimed at regulating populations and adapting, intensifying, and distributing human energies. In the second century, patristic writings began to articulate what – with the Councils of Nicaea and Constantinople – became the Trinitarian dogma; the re-employment of the word and the category of *oikonomia* (formulated by Aristotle) helped to conciliate the Trinity with monarchy and monotheism. This was true in an anti-monarchical sense as well, that is, in positions which affirmed that the oneness of God could not in any way be resolved into a plurality of divine figures without falling into polytheism. In the organizational paradigm of *oikonomia*, early Christian theology found the instrument which made the conciliation of monotheism, monarchy, and the Trinity possible. It did so on the basis of the argument that God, who both in essence and nature is one, may, insofar as regards his *oikonomia* – that is, the organization of his *oikos* and his divine life – have a son and may be articulated in a threefold figure. This is an *oikonomia* that is not, then, science in itself, for it is not bound to an internal system of discursive coherence. Rather, it was a group of decisions and

dispositions that were declared “economic” since they coped with specific, ever differing, problems concerning the functional order of the various parts composing the *oikos*. This was already the case in Aristotle, where the term “householder” (*despotes*) “does not indicate a science [*epistemen*] but a certain way of being” (*Politics*, 1255b, cited in Agamben 2011, 17).

After Nicaea and the other great councils, Christian philosophical and theological language became more sophisticated with the introduction of the concept of the *homousian*, the unity of substance; as a result, the economic paradigm with which the Trinity had originally been presented, which was too pragmatic for the new linguistic and conceptual arrangements, was officially abandoned. We should, however, note that this “organizational” sense of the theological *oikonomia* took on a certain vigor once again in religious debates – especially among Protestants – during the sixteenth and seventeenth centuries (Maifreda 2012). This was especially true of works which, like the Lutheran theologian Justus Menius’ *Christian Œconomie* (*Œconomia Christiana*) of 1529, had as their object the governing of the Christian family. For example, the Huguenot Jean Daillé (1594–1670) gave the word economy a distinctly organizational tone when, in his sermons, he affirmed, “This œconomie of the Lord in the work of our health is the foundation of the exhortation which St Paul in other times addressed to the Philippians and which today he addresses to us in the verses we are about to read to you” (Daillé 1659, 472–473). His fellow Calvinist Jean Claude (1619–1687) made an analogous observation in his *Treatise on the Composition of a Sermon* (*Traité de la composition d’un sermon*): “Nearly all these motifs may be found consolidated in Jesus-Christ, and in the mysteries of his Economie: and they are such that there is no soul which is not touched by them, unless it be – I say – not hard and insensible, but entirely dead or possessed by the devil” (Claude 1688, 402). The eighteenth-century English translation of Claude’s *Treatise*, in turn, used the word *æconomy* in the text (“In this meeting of the angels and shepherds you see a perpetual character of the *æconomy* of Jesus Christ,

wherein the highest and most sublime things are joined with the meanest and lowest”) (Claude 1788, I, 272), as well as in Robert Robertson’s annotation to his comments on the work: “The Mosaic *œconomy* included the patriarchal religion” (Claude 1788, 155). Robertson went on:

The Son presents to the Father at the last day, an account of his whole œconomy for public approbation. The world judged – the righteous rewarded – the wicked punished – he devils confined – death swallowed up in victory – eternal election accomplished. Heaven peopled with a holy multitude – Behold me, and the children, whom [sic] thou hast given me! (ibid., 333)

Another interesting seventeenth-century example of English use of the term *oikonomia* with reference to the divine activity of ordering is found in *Contemplations Moral and Divine* by the judge and natural philosopher Matthew Hale (1609–1676): “There is an admirable (Economy of the divine Godness and wisdom, to bring his creature Man both to his duty and happiness” (Hale 1699, 422). “Motion, order, and divine (Economy” were, in any case, terms whose “qualities, causes and operations” he intended to examine (ibid., 232). Richard Allestree (1619–1681), provost of Eton, also spoke of a divine economy of God regarding men: “God who is essentially happy in himself, can receive no accession to his felicity by the poor contributions of men”; he wrote those with an allusively financial choice of words. “How can it therefore be suppos’d to have made them upon intuition on increasing, but communicating his happiness. And this original design is very visible in all parts of his Economy towards them” (Allestree 1677, 2). Allestree, an able administrator of his college, was even more explicit in mentioning the divine organizing activity in another work, *The Causes of the Decay of Christian Piety*:

What then are our clamorous repining, but so many loud invectives against Fods decree; a desire to subvert his fundamental law, and confound the distinction her has irreversibly set between our earthly and our heavenly state: and, alas, what mad insolence is this, to expect that the whole (Economy of the world must be chang’d only to humour us? (1667, 211–212)

There are some examples of a theological use of the category “economy” in Catholic contexts, too.

An especially significant one is that advanced by the Jesuit historian Daniello Bartoli (1608–1685) in *The Sage’s Recreation* (*Ricreazione del savio*) of 1659. After recalling the variety of languages, laws, customs, and forms of government in the world, Bartoli concluded that for God:

That great Father of the family (since God so names himself), the whole world is a home and as St Cyprian shows, all the generations of men are a family. Thus, the economy of his providence, in so far as regards the universal motives of public sustenance, is the same for all: in the perpetual movement of the heavens, in the infallible rising of the Sun, in the fecund influences of the stars, in the stable coming of the night and the day, in the ordered succession of the seasons, in the opportune administration of the rains and the winds.

Bartoli turns from the economic dimension of the household to the organization of the system of the universe, in turn economic. He does this through the agency of God who, as father of the family, diffuses governing intelligence throughout reality. The theological foundations of the systemic sense of “economy” could not be put more explicitly nor more explicitly linked to exchange, since, as Bartoli went on:

If, because of their different positions and their various relations to the heavens, to heat and to cold, to cloudy and to fine weather, and to day and night, one or another country holds diverse shares [of natural bounty], this, too, as we shall presently demonstrate, is wise foresight on the part of that great householder Providence, in order to unite what is divided and bring those far apart closer through abundance and need, so that commerce is born: otherwise, if every clime were to have everything, none would bother with the others; and that they do not have certain things and possess more of certain other things than they can use is the work of Providence, which causes the variety of climates and, in accordance, the varying participation of the superior influences. (Bartoli 1992, 444–445)

The encounter between the economic and theological paradigm and scientific knowledge is an especially important phenomenon. It is necessary to note that significant methodological affinities link the interpretative paradigm of theological economy to another important “economic” qualification which appears frequently in the same period: animal economy. The concept of animal economy, both as a heritage of its use by

Hippocrates and Galen and as a modification of the ancient theological acceptation discussed above, occurred in the medical and alchemical literature of the sixteenth century. This happened mainly through the Hippocratic school of Paris and Paracelsus' pupils (Balan 1975). In Paracelsus' view, the real power of stars lies in the firmamental coordination and correspondence by which phenomena and objects are chained together. There is a double firmament, he maintains, one in the heavens and one in each body, and these are linked by mutual concordance. Once again, the concept of economy becomes central in describing systemic interrelations based on an intrinsic balance. "If, for example," Paracelsus writes, "a discord takes place in the coordination of the firmament on one hand and the human economy on the other, the latter will be broken" (Pagel 1982, 68).

On this basis, the category of animal economy entered Renaissance medical culture, designating a functional internal order of any organism in which a healthy condition is the result of the sum of the health of every single individual part through a harmonious balance. In this way, animal economy became central in the writings of chemists and biologists such as Georg Ernst Stahl (1660–1734), Buffon (1707–1788), and, above all, Charles Bonnet (1720–1793), who made a comparison between animal economy and world economy as a harmonic equilibrium of single parts (Balan 1975).

In 1615, Antoine de Montchrétien (1575–1621), a poet and dramatist, published what is sometimes considered the founding text of political economy: *Patronal Political Œconomie. A Treatise in Political Œconomie: Dedicated in 1615 to the King and the Queen Mother of the King (Œconomie politique patronale. Traicté de l'æconomie politique: dédié en 1615 au Roy et à la Reyne mère du Roy)*. It was his only "economic" work and the last work he published (Panichi 1989). Montchrétien wrote of "economy" at the end of his literary career; this is the same course taken some decades later by another author from Normandy, Pierre de Boisguilbert (1647–1714), though his production was more ample.

A dramatist and translator from the Greek at Port Royal from 1674 to 1685, Boisguilbert wrote *France in Detail, the Cause of the Waning of Its Goods and the Ease of Remedy, furnishing in a Month all the Silver which the King Needs to Enrich Everyone (Le Détail de la France, la cause de la diminution de ses biens et la facilité du remède en fournissant en un mois tout l'argent dont le Roi a besoin et enrichissant tout le monde)*, printed in 1695 but written much earlier, as well as *Facts of France (Factum de la France)* and *A Dissertation on the Nature of Riches (Dissertation sur la nature des richesses)*, which can be dated to 1707 (Faccarello 1999).

The prior literary experience of these two authors had a significant bearing on the development of "economic" discourse. The habit of referring to economic operators as "actors" who "play their roles in the Republic" and "contribute" in this way to "the perfection of all sorts of projects and exchanges" was launched by Boisguilbert who also used the term "applause" to indicate the approval of those who were directly interested in perpetuating the state of crisis in French finances, which he dated back to 1660 (Faccarello 1999, 11). That Montchrétien's education was not that of a merchant was quite evident in his style of discourse, which was almost wholly lacking in quantitative aspirations, relying instead on ample metaphorical, philosophical, and political argumentation. Well aware of the scarce estimation in which the elites of the time held his theme and of the distance between what the public expected of him and what *Œconomie politique patronale* really had to say, Montchrétien excused himself to his sovereign, in the work's dedicatory letter, "for the minute things which seem to be treated here," warning him that "the principles I propose are not the most striking and magnificent [ones]" (Montchrétien 1899, 5).

Montchrétien situates his presentation on a consciously scientific plane, inviting those to whom he dedicates it – and other readers – to look at "the truth" of a nation, of France, as a single great living organism. A "mighty plane-tree, such as [the one] Themistocles compared himself to, where everyone seeks cover and then, departing again, breaks off and carries away a

branch or two” (ibid., 5). The national economy and organized political action could be identified with a natural cycle and were, therefore, themselves natural in the double sense of their inalterability and their “truth” when subjected to the analytic instruments of a philosophical observation of nature. Given that “those who are called to the government of the estates should have the glory, the increase and the enrichment of it as their chief object,” Montchrétien’s project was first of all a re-evaluation of the function of government. “To that great and most honourable design,” he wrote, “your pacific majesties can apply yourselves; in what may the persons whom you choose to admit to the administration of your affairs be more worthily and usefully employed, if not to vigil over and work for the order, employment and reconciliation of your people?” (ibid., 5). In this question was the very definition of the “patronal political *œconomie*” named in the title: order, labor, and “reconciliation,” which might be obtained through work and government vigilance.

So, an economy at once can be political and patronal: political (since it represents “the true maxims of estate and police” (ibid., 3)) because it was an essential part of the functions of royal power, the science of the administration of the property and resources of the state, and the end result of a process of a separation of the “civil” and the “political” (or public) which had been in course at least since Bodin (Panichi 1989, 68–70) and patronal because it envisioned a decisive governing action on the part of the sovereign and his functionaries, fathers, and masters of the *oikos* (“household”) in the Aristotelian sense (Montchrétien 1899, 12). The *oikos* with which political economy is concerned is not then the state in its entirety: its components are the lowly, the subjects who appear negligible to a sovereign, used to seeing in the first two *états*, the clergy and the nobility, the very essence of the nation. In contrast to what occurred with regard to justice, in the context of which the three estates of the national body acted and were placed in relation to one another, society was once more divided up into its fundamental components in order to serve the ends of *political œconomie*. The theory of

political œconomie can act on the meaner parts of the body politic, leaving the ordering of the high, “delicate,” parts in the hand of the sovereign (“Your Own hands”)—once again, a metaphor that is, as we know, full of theoretical implications. Economic science is, then, a science of the third estate: the one “made up of three kinds of man – workers, artisans and merchants.” Farmers, artisans, and merchants, inasmuch as they are holders of the dignity afforded by labor, are considered as a single culturally and socially homogeneous entity: “They mingle and join together easily, since they symbolize the same quality and tone of life, manners and humours, of action and condition” (Montchrétien 1899, 12; Maifreda 2012).

Impact and Legacy

In the early decades of the eighteenth century, the prince of the physiocrats, François Quesnay (1694–1774), physician to the Duke of Villeroy, placed the lemma *œconomie animale* in the title of his first work, the *Physical Essay on the Animal Economy* (*Essai physique sur l’œconomie animale*) (Quesnay 1736; Groenewegen 2001). The content of the treatise, which indicates yet again the long life of the Hippocratic-Galenic hypothesis, was divided into three parts. A first chapter was devoted to the elements, posing questions as to matter and its movements, as well as to fire, air, water, earth, oil, and salt. A second section regarded the humors; in this, Quesnay discussed digestion and the blood and proposed a general classification of the humors. The third and final part treated the “solid parts,” describing the various temperaments. In virtue of this work, Quesnay – who was already a member of the Académie de Lyon and the author of tracts concerning the utility of bloodletting (*Observations sur les effets de la saignée*, 1730, and *L’Art de guérir par la saignée*, 1736) – was elected secretary of the Académie de Chirurgie in 1739. When, in 1755, Etienne Bonnot de Condillac (1715–1780) – who had taken a degree in theology at the Sorbonne – published his *Treatise on Animals* (*Traité des animaux*), he credited Quesnay with having, in the *Animal Economy*,

“destroyed . . . the mechanism imaged by the Cartesians” and repropounded by Buffon as the theme of the cerebral origins of movement (Bonnot de Condillac 1798, 465).

In any event, when François Quesnay put the term *œconomie* in the title of his volume, it had been in use for some time, especially in the context of the first efforts to give a firm basis to physiological knowledge. In 1659, Walter Charleton (1619–1707), who was physician to both Charles I and Charles II and who popularized Harvey’s physiology, published an *Œconomia animalis*, which came out simultaneously in English under the title *Natural History of Nutrition, Life, and Voluntary Motion*. Another work, entitled *Medical and Physiological Dissertation on the Œconomy of Animals (Dissertatio medico-physiologica de Œconomia animali)*, by Johann Adolf Wedel (1645–1747) was printed in Jena in 1717. It is significant that Charleton declared himself to be one with the chief atomist scientists in the full title of his most important work, the *Physiologia Epicuro-Gassendo-Charltoniana: Or a Fabrick of Science natural, upon the Hypothesis of Atoms, Founded by Epicurus, Repaired by Petrus Gassendus*. His writings were, in fact, the main vehicle for the diffusion of Epicureanism in England, and his work represents an important element for understanding atomism and theological voluntarism in English natural philosophy during the latter half of the seventeenth century (Parkin 1999). In this way, the “economic” investigation of physiology or of other human and animal functions became common usage: in 1803, for example, Vincenzo Monti, when inaugurating the academic year at the University of Pavia, referred to Marcello Malpighi’s discoveries. “For us Italians,” he stated, these discoveries meant that “the entire economy of animal motion has felt the laws of calculation and even perspiration has been weighed on scales” (Monti 1841, 224).

With the outstanding success of Robert Dodsley’s *Œconomy of Human Life*, first published in 1750, the word became increasingly present everywhere. In fact, the volume ran to some two hundred editions, including forty eight in the United States, as well as translations into

Latin, Hebrew, Russian, German, Italian, Spanish, Portuguese, French, and Danish (Eddy 1988). Widely popularized and parodied in daily newspapers as well as in magazines, the book’s first part, entitled “Duties that Relate to Man Considered as an Individual,” included treatments of “Consideration, Modesty, Application, Emulation, Prudence, Fortitude, Contentment and Temperance” and the second part, “On the Passions,” treated the themes of “Hope and Fear, Joy and Grief, Anger, Pity and Desire and Love.” The following parts were dedicated to “Woman,” to the family (“Consanguinity, or Natural Relations”), and to hierarchical relations (“Wise and Ignorant,” “Rich and Poor,” “Masters and Servants,” “Magistrates and Subjects”). The last two parts discussed the themes of “Social Duties (Benevolence, Justice, Charity, Gratitude, and Sincerity)” and “Religion.” Dodsley’s *Œconomy*, which appeared anonymously, was a veritable psychological and social physiology, offering an integrated image of the human spirit and a social and religious system with a strongly moral cast. The final page of the text presented a unified vision of this *œconomy*:

O fear the Lord, therefore, all days of thy life; and walk in the paths which he hath opened before thee. Let prudence admonish thee; let temperance restrain; let justice guide thy hand, benevolence warm thy hearth, and gratitude to Heaven inspire thee with devotion. These shall give the happiness in thy present state, and bring thee to the mansions of eternal felicity in the paradise of God. This is the true ŒCONOMY OF HUMAN LIFE. (Dodsley 1781, 94; capitals are in the original)

Again, what is most interesting for us in the “economic” production, insofar as it relates to social and naturalistic themes, is the methodology which it applies to reality. This affirms a systematic epistemology of observation regarding the links between diverse phenomena, illustrated in metaphors that sink deeply into successive economic language. The one present in the very title of the book Johann Bohn (1640–1718) dedicates to Malpighi, printed in Leipzig in 1686 – *The Anatomic-Physiological Circle, or the Œconomy of Animal Bodies (Circulus anatomico-physiologicus, seu œconomia corporis animalis)* (1686) – is especially significative. Marcello Malpighi’s own monumental

compendium (*Opera omnia*), published in London in 1687 by the Royal Society, was greeted enthusiastically by the *Bibliothèque universelle et historique* with the typically “economic” metaphors of separation and medley:

Here is the beginning of the discoveries of our author regarding the liver, the spleen, the kidneys, and the brain, from which one gathers that these organs are sorts of sieves or drains, that filter through their glands various kinds of juices, to serve the needs of the *animated body*; that almost all the *animal Economy* turns chiefly on the separation, and a part on the mixture, of certain liquors. (Le Clerc et al. 1688, 59)

We should also recall that the metaphor of the circulation of liquidity within society – proceeding from circle-oriented theoretical formulations widespread in cosmology and physiology during the sixteenth and seventeenth centuries (Lowry 1974) – finds a classic formulation in Thomas Hobbes. When, in the dedicatory letter prefacing *On Bodies* (*De corpore*, 1655) he listed the members of what he considered the tiny group of true scientists, Hobbes included Galileo Galilei, Nicolaus Copernicus, Johannes Kepler, Marin Mersenne, Pierre Gassendi, and William Harvey. The last of these, in *On the Motion of the Heart and Blood* (*De motu cordis et sanguinis*, 1628), had dedicated his discovery of the circulation of blood to King Charles I (Martinich 1999; Sorell 2000). Hobbes, who was interested in autopsies, saw those carried out by Harvey himself and by his personal secretary, William Petty, who, from 1650, was professor of anatomy at Oxford and, contemporaneously, taught music at Gresham College (Martinich 1999, 218–219; Aspromourgos 2001). In Chapter 24 of *Leviathan*, entitled “Of the Nutrition, and Procreation of a Common-Wealth,” Hobbes could thus adopt Harvey’s innovations and re-elaborate them in monetary terms. The circulation of wealth was represented by Hobbes as an autonomous force intrinsic in “artificial man,” in line with the mechanistic, Cartesian structure which characterizes *Leviathan* as a whole: the state there is a mechanical body, a clock, or an automaton:

The conduits, and ways by which [money] is conveyed to the public use, are of two sorts; one, that

conveyeth it to the publique coffers; the other, that issueth the same out again for publique payments. Of the first sort, are collectors, receivers, and treasurers; of the second are the treasurers again, and the officers appointed for payment of severall publique or private ministers. And in this also, the artificial man maintains his resemblance with the natural; whose veins receiving the blood from the severall parts of the body, carry it to the heart; where being made vital, the heart by the arteries sends it out again, to enliven, and enable for motion all the members of the same. (Hobbes 1998, 168)

Harvey’s discoveries were a decisive, foundational component of the whole physiology originally conceived as an “economic” science of nature. The heart took on the role of a muscle or pump, whose chief function was to exert pressure on the blood, permitting circulation. The blood, in contrast to Descartes’s hypothesis that it boiled like crushed grapes in a fermentation vat and increased in volume like heated milk, was instead pushed. The heart thus found itself at the center of a mechanical system in whose conception the heritage of Aristotle may still be discerned: Harvey’s demonstration of his theory was based on the perfection of circular movement as an imitation of celestial and atmospheric phenomena, especially the water cycle (Lennox 2006). He had, in fact, received his doctorate at the University of Padua, where he studied between 1599 and 1603, when he was a pupil of Fabrizio d’Acquapendente, whose fame is linked to the discovery of the venous valves (formalized in *De venarum ostiis* of 1603), which were the central feature of his anatomy lessons in Padua. And it was precisely in thinking about the relationship of the venous valves to the heart that led – as he told Robert Boyle – to Harvey’s intuition about the circulation of the blood in the years before 1628. Hobbes himself travelled to Italy twice: firstly, on a trip in 1610–1613, when he spent most of his time in Venice, and, secondly, in 1634–1637, when he went to visit Galileo, who was under house arrest in Arcetri. It has recently been suggested that, in the course of one of these trips, Hobbes – perhaps through Paolo Sarpi – became acquainted with Bernardo Davanzati’s *Lesson on Money*, which termed money “a second blood” – probably the oldest example of recourse

to such an analogy in monetary theory (Pagel 1967; Boldizzoni 2005).

The physiological-circulatory category of “flow” is also the basis of the conceptual model of the market formulated by Thomas Mun who, somewhat imprecisely, is considered the creator of the idea of “balance of trade.” In the three tracts he wrote in the 1620s (*A Discourse of Trade, from England unto the East Indies*, 1621; *England’s Treasure by Forraign Trade*, written in 1623, but published only in 1644; and *The Petition and Remonstrance of the Governor and Company of Merchants of London trading to the East-Indies*, 1628), Mun, an East India company magnate and member of the Privy Council subcommittee instituted to gather information on the contemporary English economic situation and possible remedies, in reality built up an interpretative model of international commerce for which the metaphor of the scale is inappropriate (Oldham Appleby 1978, 37–39). Mun did not evoke a system of weights and counters capable of balancing one another, but rather a persistent, complementary, and orderly flow of goods and money. Omitting entirely any expression of the propulsive force of the movement of purchase and payment and scanting the role of the consumers, he delineated a transmission of fluids, linking country to country, supported by the private interest of merchants, landowners, and their dependants. As one of the most acute scholars who have studied him observed, Mun’s universe of commercial exchange is “essentially a coherent and mutually supporting community” (ibid., 38), which might be damaged by any restriction, destroying a chain of emulation like a cancer reaching out to devastate a body. The flow of trade must then remain free, so that “the particular members do accommodate each other, and all accomplish the whole body of the trade, which will ever languish if the harmony of her health be distempered by the diseases of excess at home, violence abroad, charges and restrictions at home or abroad” (ibid., 39).

As the seventeenth century wore on, the term “economy,” then, consolidated into a synonym of systemic interrelation. For example, Danilo

Bartoli, in his treatise of 1682 *On Coagulation (Della coagulazione)*, wrote the following:

I know there are those who, considering a certain little creature, deny that it has well-formed organic parts, but only a something or other – that not even they themselves know – that substitutes everything. I regret that to show them, I can find no anatomist, nor any anatomist can find tools – if not a thousand times larger than the body they would have to cut up. If such might be found, perhaps we would not be without a microscope with many lenses, and so excellent, that it would be able to show each of the parts large: and then, oh how much more worthy a spectacle would the economy of the body of that undefinable little creature be, than that of a huge elephant! (Bartoli 1682, 198–199)

Pierre Gassendi (1592–1655), in his treatment of the generation of animals (summarized under the title *De la generation des animaux* in François Bernier’s *Abrégé de la philosophie de Gassendi*), used the term economy to designate the extremely complex and shadowy system governing the relationships between parts of the body of animals. Its significance – and, indeed, the very recognition of its existence – implied no knowledge of the single parts which composed it. It had characteristics of uniqueness and reproducibility, exactly like the objects of what would become the economic science of society:

When, I say, we shall have managed to express all that, and a hundred other things of the same sort, all our sagacity and all our eloquence will at last be obliged to stop there, and it must be declared that we will have done nothing that gives us a true knowledge of this internal – hidden – Economy and that we glimpse this sort of artisan, or labourer, who has used such exquisite little organs with such address to work a matter – and has made so right a work of it, so well proportioned and so well organized. That is why we have only to admire these inimitable works and this divine and incomparable labourer who in the seeds of things to be created, placed, fixed, these sorts of tiny workers, so wise, so prudent, so far-seeing, so industrious. (Bernier 1984)

It is, in any case, significant that the linguistic diffusion of the economic-physiological metaphor came about in the same years in which the nearly synonymous Latin word *organismus* and its derivatives re-emerged in the work of Georg Ernst Stahl (1660–1734), a chemist who was Friedrich Wilhelm I of Prussia’s physician. The first use of

the term *organisme* in French can be found in the early eighteenth century, parallel to the progressive affirmation of *organism*, *organismo*, and *organismus* in medical-physiological literature in English, Italian, and German, always with reference to a specific, systematic, ordering principle applicable to plants, animals, or the entire terrestrial globe. At the end of the eighteenth century, the term “organic” began to assume its contemporary sense of a generic way of indicating individual living entities. It was probably around 1830 that the adjective finally became a noun, commonly used in the sense of “organic body,” with the emergence of biology in its contemporary forms (Cheung 2006).

In this manner, the physiological-systemic sense of “economy” links up to the equally evocative sense of procedures of organic coordination: that is, the sense, already current in the classical period, of harmonious order of the parts of a work (Maifreda 2012). The *œconomy* in question referred to the meditated and functional reorganization of a subject or a group of enunciations, according to usage that was fully consonant with the period. In any case, the physiological and discursive-organizational senses of “*œconomy*” found perfect accordance in volumes like *Œconomia Hippocratis alphabeti serie distincta* (1588) by the Metz physician Anuce Foes (Foesius, 1528–1595), a doubly “economic” treatise in its organization and its theme. Foes’ other great effort, the *Opera omnia* of Hippocrates, the first virtually complete collection of his Greek texts with Latin translation, printed in 1595, was certainly among the volumes possessed and read in a seventeenth-century edition by another famous philosopher with a medical education and strong economic interests: John Locke (Locke 1989, 341).

Finally, we should not forget that Linnaeus himself, in *Academic Specimen of Œconomy of Nature* (*Specimen academicum de œconomia naturae*), printed in Uppsala in 1749, put forward a precise definition of the expression “economy of nature.” He did so using concepts and terms that were theological and scientific, building a heuristics of the natural world founded on a theological and systematic view of phenomena:

For “natural economy” we intend the most wise disposition [*dispositio*] of natural beings, instituted by the sovereign Creator, according to which these tend to common ends and exercise reciprocal functions. All the things comprised within the limits of this universe celebrate aloud the wisdom of the creator. All that which falls under our senses, all that which is present in our minds and is worth existing, concurs, through its disposition, to manifesting the glory of God, that is to producing the end that God has willed to be the scope of all his works. (quoted in Agamben 2011, 306)

It has been demonstrated that a strict relationship exists between Linnaeus’s epistemology of nature and the economic categories set out by him in various parts of his work. Linnaeus believed that science, with its practical effects, was the primary instrument in pursuit of an ideal of national autarchy by substituting importations through the development of agronomic knowledge. That is why he engaged in an ambitious project of research aimed at discovering techniques for growing exotic plants and essences, studying together the substitution of species which could not be grown in Sweden and domestic plants carrying analogous qualities. In addition, Linnaeus’s economic interests informed his agenda for a reform in educational and administrative systems founded on the assumption that *œconomy*, viewed as the science of natural production relative to human needs, must be included in obligatory university programs. Linnaeus’s economy is, then, a “new science” and a pedagogical tool capable of providing a secure methodological foundation for a culture of the administrative apparatus of the state and, at the same time, a systematic discipline of the allocation and exploitation of natural resources (Koerner 1999). We should also note the way in which – even in the botanic and classificatory research which made his fame – Linnaeus applied a criterion of onomastic selection basically drawn from a market metaphor regulated by specific institutions. In his *Botanic Critique* (*Critica botanica*) of 1737, he wrote that “the generic name” of every plant “has the same value on the market of botany, as the coin has in the commonwealth, which is accepted at a certain price – without necessitating a metallurgic examination –

and is received by others on a daily basis, as long as it has become known in the commonwealth” (Müller-Wille 2003).

Along this road, the term “œconomy” travelled throughout the eighteenth century and a part of the nineteenth century as well, representing an important theoretical model in the development of the physiological and natural sciences. The situation changed at last when, in 1866, Ernst Haeckel declared that the term “œcologie” was more appropriate (Schabas 1990; Schabas and de Marchi 2003), freeing the path for “political economy,” a distant, and by then cumbersome, “relative.”

Eleavoulkos, Theophanes

Born: 16th Century

Died: 16th Century

Georgios Arabatzis
Department of Philosophy, Pedagogy and
Psychology, National and Kapodistrian
University of Athens, Athens, Greece

Abstract

Theophanes Eleavoulkos was a scholar and monk that held the title of the Grand Rhetor of the Greek Church. He engaged in a controversy with the physician-scholar Hermodoros

Listarchos († ci. 1600) about the question of philosophical culture and education. The letters that the two thinkers exchanged constitute a testimony about the condition of post-Byzantine philosophy in Greece under Ottoman rule.

Keywords

Hermodoros Listarchos · Philosophical compilation · Sane philosophy · Greek philosophical culture

Alternate Names

[Eleavoulkos, Thomas](#)

Biography

Theophanes (Thomas by his layman’s name) Eleavoulkos was a Greek scholar and monk; his family came from Peloponnese (Sparta), but Theophanes lived in Constantinople, Mount Athos, and the city of Veroia in Northern Greece. In Constantinople, he held the title of the Grand Rhetor of the Greek Church granted to him by Patriarch Dionysius II (†1556). After the death of the Patriarch, he fell into disfavor and left Constantinople (See Sathas 1868, 144–145; Gritsopoulos 1966, 91–94). The question about philosophical education was the object of a dispute between him and Hermodoros Listarchos (ci. 1500–1577) during the years 1539–1542; Listarchos was a doctor-scholar from the island of Zakynthos in the Ionian Sea who studied in Rome and Ferrara, taught in Chios, and wrote letters about the philosophical culture of the sixteenth century. To oppose Hermodoros, Eleavoulkos wrote, in form of a series of letters, the treatise, “Ἐλεγχος κατὰ τῶν ἀπαιδευτῶς χρωμένων τοῖς λόγοις ἢ κατ’ Ἑρμοδώρου (*Critique of Those Who Exercise into the (Philosophical) Discourse Without Education or Against Hermodoros*) (See Bobou-Stamati 2002, 21–32). The controversy revolved around the nature of the philosophical discourse and

education and provided sparse evidence about some philosophical activity in Greece during the first century of the Ottoman occupation (See Steiris 2009, 182). In particular, the object of the dispute was the criticism of the philosophy in the form of an anthology of opinions and *dicta*. It also includes references to the role of the new and the old (Aristotelian) positive sciences and the concept of true philosophy. Although the quality of the arguments is not particularly high, it is possible to identify there themes that were destined to occupy post-Byzantine and Modern Greek philosophy philosophical activity up to the time of Enlightenment.

Elements, Renaissance Theory of Natural

Rodolfo Garau

ERC Project Early Modern Cosmology,
Università Ca' Foscari, Venezia, Venice, Italy

Abstract

For centuries, the conception of natural elements in the Western world was dominated by Aristotle's four elements-theory. In addition of being part of university curricula, such theory scaffolded the alchemical conception of matter. Starting from the seventeenth century, mechanical philosophers claimed that different material qualities were due to quantitative differences among their components. This new understanding of matter – also informed by the revival of classic atomism – paved the way to the emergence of chemistry.

Heritage and Rupture with the Tradition

For centuries, the conception of natural elements in the Western world was dominated by Aristotle's four elements-theory. Aristotle expounded this theory mainly in book II of *On Generation and Corruption*. Accordingly, everything is composed by a material substratum – called by Aristotle “matter” – that has no separate existence from, but is always bound up with, what Aristotle calls “contrary qualities” – hot, cold, dry, and moist. Hot and cold are characterized by a certain “power to act,” while dry and moist by “susceptibility.” Contrary elements – hot and cold, dry and moist – cannot be in the same subject; from this, it follows that the material substratum can be characterized by four couplets: hot and dry, hot and moist, cold and dry, cold and moist. These couplets correspond to the four elements – fire, air, water, and earth – but just in the sense that their characterizing quality (heat, moist, cold, and dry) predominates in the couplet – so fire, for instance,

is a blend of heat and dry, but where heat is present in excess, etc. As these elements are active, they continuously turn into one another in a process that is described by Aristotle as one of “coming-to-be”; however, this takes place through the change of one of the two qualities of each couplet characterizing the element. For instance, fire, which is hot and dry, will turn into air, which is hot and moist, if the moist will overcome the dry. This is important because Aristotle excludes the possibility of alteration, that is, the idea that an element, being univocally characterized, turns into another – for instance, that air, being “only air” and thus not a combination of different qualities, turns into fire, or water, or earth. The exclusion of alteration has an important role in Aristotle’s theory, because it allows him to deny the pre-Socratic theories of the origin of the universe from a single element. The coming-to-be of the elements can be cyclical (as one turns into another which turns into another, etc.), or due to combination: for instance, from fire (hot and dry) plus water (cold and moist), it will result air (hot and moist) and earth (cold and dry). The change of both qualities at once (and so the possibility that, for instance, fire turns into water) is not completely ruled out by Aristotle, who however described it as very difficult.

It is important to keep in mind that Aristotle’s theory of natural elements was integrated in his description of motion. Elements have indeed different “natural places” – or, as Aristotle puts it in *On Generation and Corruption*, belong to different “regions” – namely, the “center” of the Earth and the “limit” of the Earth’s sphere. Cold elements belong to, and (if not impeded) tend to move towards, the center, while hot ones to, and towards, the limit. Though all hot and cold elements tend towards the same places, the elements that Aristotle deems as “purest” – namely, fire and earth – tend to occupy the regions that are close to their natural places, while water and air, which for Aristotle are more intermediate and blend, tend to occupy intermediate positions.

As a consequence, Aristotle’s theory of natural elements was part of a doctrine that provided a comprehensive account of sublunary phenomena; for centuries, it enjoyed wide acceptance and institutional endorsement. This theory represented also the basis for the alchemical matter theory, which was often complemented with additional elements – sulfur and mercury – and provided the rationale to understand the possibility of transmutation.

In the Renaissance, a number of natural philosophers developed criticisms of the Aristotelian theory of natural elements. The criticisms were inspired by an array of sources. For instance ancient atomism (whose re-popularization had started in the fifteenth century with the rediscovery and publication of Lucretius’ *De rerum natura*) provided the rationale for quantitative explanation of different material qualities. Copernicanism, to quote another, contradicted the Aristotelian claim that the center of the Earth corresponded to the center of the universe, and so the idea of the natural motion of elements. Other criticisms were even more comprehensive, to the point of offering the basis for a new system of natural philosophy.

In the seventeenth century, quantitative, corpuscularian explanations of the nature of different qualities begun to challenge first, and then replaced, Aristotle’s theory of natural elements, thus paving the way to the emergence of quantitative chemistry.

Innovative and Original Aspects

Renaissance thinkers offered original and eclectic criticisms of the Aristotelian theory of natural elements. In *The Ash Wednesday Supper* (1584), for instance, Giordano Bruno endorsed Copernican heliocentrism, and on that basis denied that elements have absolute natural places. While his idea of an infinity of worlds was inspired by Lucretius, he later argued that the universe was composed by a Universal Soul informing an undifferentiated and passive Universal Matter. To make another example, in *De rerum natura*

iuxta propria (firstly published in 1570) Bernardino Telesio provided a comprehensive rethinking of Aristotelian cosmology based on a new conception of matter. Telesio argued for the existence of two active principles – heat and cold – endowed with sensibility and constantly fighting for the reciprocal information of matter, otherwise inert and deprived of qualities. A strong addition came also from alchemy, and especially from Paracelsus (1493–1541). Paracelsus argued that the Aristotelian four elements were not simple, but in turned composed by the mixture of other three: sulfur, salt, and mercury. In addition to this, many inquirers – such as Julius Caesar Scaliger (1484–1558), Angelo Sala (1576–1636) – started developing corpuscularian conceptions of matter.

In the seventeenth century, a number of philosophers began to offer corpuscularian and mechanical interpretations to natural elements. Elements of a corpuscularian conception of matter can be found in various works of Francis Bacon's (1561–1626); they coexist with elements derived from Paracelsian alchemy. Pierre Gassendi (1592–1655) offered a comprehensive revival of Epicurean atomism and thus a decisive contribution to a quantitative understanding of natural elements. Gassendi presented the hypothesis that all things in nature are made of atoms (which in the 1649 *Animadversiones* he described as endowed with motion and gravity, while in 1658 *Syntagma philosophicum* he described as inert). Atoms form in turn “molecules.” While all atoms have the same motion, molecules are endowed with different texture and a specific motion – on which grounds Gassendi explains the emergence of different biological and chemical properties. But it was especially René Descartes (1596–1650) to provide a comprehensive corpuscular rethinking of natural elements. In the *Principles of Philosophy* (1644), Descartes argued for the existence of three natural elements – earth, air, and fire – corresponding to corpuscles of different shapes – respectively, coarse and irregular, spherical, fine, and elongated – and size – with the corpuscles of earth being the biggest and those of fire being the smallest. Descartes believed that

the universe is a material continuum where no vacuum is given and that the different celestial bodies are set in motion by vortices of matter. The corpuscles of different elements are brought about by the friction of these different vortices, with the corpuscles of fires being the smallest debris – and for this reason most susceptible to motion – of such process.

Impact and Legacy

The new understanding of natural elements offered by alchemy and corpuscularianism had a significant impact in the development of modern chemistry. Robert Boyle (1627–1691), one of the founding figures of modern chemistry, was particularly receptive of them. In the *Sceptical Chymist* (1661), Boyle argued against the Aristotelian conception of elements, showing that it was impossible to combine the four elements to form any substance, and equally impossible to resolve any substance in the four elements. On the contrary, Boyle provided a new definition of element that approached the modern definition of chemical element. He defined elements as perfectly unmingled bodies, which, in other words, are not made by any other body and compose other bodies, into which they are ultimately resolved. In *The Origine of Formes and Qualities* (1666), he provided a mechanistic underpinning to this theory, by claiming that matter is composed by minimal corpuscles that have only mechanical properties. However, these corpuscles form clusters of higher degrees, which are endowed not only with mechanical properties, but also chemical ones.

Emblem, Renaissance Origin of

David Graham

Provost and Vice-President Academic Affairs,
University of Ottawa, Ottawa, ON, Canada

Abstract

Fortuitously created in 1531 when the Augsburg publisher Heinrich Steyner published an unauthorized collection of Latin epigrams by the legal scholar Andrea Alciato to which he had added woodcuts, the European emblem rapidly became a pan-European phenomenon that lasted some two centuries. As a bimodal construction in which a visual image combines with one or more textual fragments in a unique way to impose a moral lesson on the reader, the emblem is similar to other such Renaissance genres, including the device, the *impresa*, and the beast fable, but differs from them semiotically in several important respects. Modified emblematic forms quickly spread beyond the confines of the printed page to find a home in the applied arts. Emblems frequently appear on and in both public and private buildings, usually without the bulk of their accompanying text, no doubt with the purpose of signalling or bringing to mind the moral lessons the originals had conveyed and of linking them with the proprietor of the built space. As emblems moved from the realm of moral literature to that of design and pedagogy, many emblem books were dismembered for their woodcuts, and derivative compilations of visual emblematic material appeared late in the seventeenth century for use in the applied arts. Emblems and the emblematic reading process survive today in advertising, propaganda, flags, corporate logos, and elsewhere.

Heritage and Rupture with the Tradition

The European emblem has at times been considered the intellectual heir and successor of the

heraldic tradition, of the *Physiologus* and bestiary literature, of Egyptian hieroglyphics, and of the *Hypnerotomachia Poliphili*. In reality, however, it was essentially the brainchild of one Andrea Alciato (1492–1550), an Italian legal scholar of Milanese origin living in Bourges, France. In the 1520s, Alciato had composed and circulated in manuscript form a collection of moralizing Latin epigrams – which he called *emblemata* – inspired by a variety of sources: the *Greek Anthology*, Ovid’s *Metamorphoses*, memories of Roman monuments and tombs he had seen as a student in Italy, and his deep knowledge of classical literature. Alciato’s use of the term appears to derive both from his use of found textual fragments and his view that humanists could adopt such epigrams as a kind of “badge.” His manuscript came into the possession of the Augsburg publisher Heinrich Steyner, who added a set of woodcuts to them and published them without seeking permission. Alciato had not foreseen the addition of illustrations to his texts, but was quick to recognize the commercial potential of the combination, and authorized editions overseen by him until his death began to appear from 1534 onward, ultimately expanding the number of emblems from the original 100 or so to 212. Alciato was quickly emulated by scores of other authors wishing to capitalize on the new craze, and both vernacular and Latin emblem books began to appear in the 1540s, spreading throughout Europe as far as Russia, Spain, and England.

The canonical emblem is often said to be a tripartite form (the *emblemata triplex*), consisting of a visual image (or *pictura*), a motto, title, or caption (the *inscriptio*), and a short explanatory verse or prose text (the *subscriptio*). In reality, however, the number of emblematic forms is so large and varied as to defy systematic description or codification, despite valiant attempts by theorists from the seventeenth century to the present day. The emblem is both a moralizing polyform and the process of reading it: a bimedral combination of image and text – the so-called “naked emblems” published by Denis de Harsy and others may safely be considered aberrations published purely for commercial reasons – encoding a generalized moral lesson that is

personalized and transferred to the reader’s own life through an iterative reading in which text and picture take turns to direct the reader’s attention back and forth among the emblem’s parts. Though the initial visual image is enigmatic – and a given *pictura* may thus appear in various emblems with different meanings – the riddle is meant to be unambiguously resolved by this reading process, so that the final meaning is unequivocal. The emblem differs from such other bimedral Renaissance genres as the *impresa* and the device, which function by signalling a personal aspiration or quality of the owner (as in heraldry) rather than by presenting a moral lesson to the reader for his or her own use.

Impact and Legacy

The emblem’s legacy is astonishingly pervasive. Quickly leaping from print to the applied arts, emblematic reminiscences soon appeared in literature, in painting, and across the entire spectrum of material culture: in tapestry, embroidery, ceramics, glassware, furniture, trenchers, book-binding, tombstones, numismatics, personal adornment, and architecture. The Jesuits were particularly keen adopters of the emblem, which was well suited to their spiritual practices and to their pedagogy, producing many collections of manuscript emblems in their colleges. Emblems were carried by Christian missionaries to Africa, to South America, and to East Asia, resulting in new and exotic productions. European publishers also produced enormous compilations of emblematic visual material for the use of designers. Emblematic survivals in our own time include the semiotic processes at work in advertising and propaganda, as well as flags and corporate logos, not to mention a few modern emblem books and several excellent emblematic websites.

Empire, Renaissance

Thomas Dandeleit

University of California, Berkeley, CA, USA

Abstract

This entry traces the evolution of the meaning of empire during the long Renaissance from roughly 1340 to 1700. It focuses on the rebirth or revival of knowledge concerning the ancient

Roman Empire and the central role that this new historical consciousness played in shaping both the political meaning and reality of the new European empires of Early Modern Europe. Beginning with the foundational work of Petrarch for the revival of historical interest in Caesar as a political role model and example to be imitated in the fourteenth century, the early section also notes Petrarch's fifteenth-century disciples, Guarino Guarini and Flavio Biondo, who embraced and furthered a distinct form of *imperial humanism* that was produced for the Renaissance courts of Ferrara and Rome and that was meant to inspire and instruct princes such as the d'Este and Gonzaga. They, in turn, patronized artists such as Mantegna and Alberti whose artistic and architectural work was instrumental in giving early material form to the idea of imperial revival. In the sixteenth century, the Renaissance idea of imperial revival that had previously remained a literary dream took on powerful new meaning with the rise of the empire of Charles V (1500–1557), the first Renaissance Caesar who rivaled the ancient Caesars in power and authority, as the Florentine humanist Francesco Guicciardini noted. Ruling over a global empire that included most of Iberia, much of Italy, substantial parts of Germany and the Netherlands, and the conquered American empires of the Inca and Aztec, Charles V was surpassed only by his son, Philip II (1527–98), who added Portugal and all of its empire to the territories inherited from his father. Spanish royal historians such as Pedro Mexia and Juan Gines de Sepulveda provided political guidance and models as they added to the literature of imperial humanism that also served to provide justification for this new Roman Empire. For the sixteenth century, the meaning of empire was subsequently expressed by and embodied in the Spanish Empire. Envied by the French and British, it became a model for their own imperial pursuits that came to fruition in the later seventeenth centuries bolstered by the same imperial humanist ideals of empire and aesthetics that first rose in early Renaissance Italy.

The Medieval Heritage

In the middle of the fourteenth century, as the Petrarchan Renaissance was just beginning to take root in Italy, the word empire for western Europeans first and foremost referred to the Holy Roman Empire. A fragmented collection of Germanic territories ruled over by an emperor whose title was originally bestowed by Pope Leo III on the Carolingian king, Charlemagne, in 800, the Holy Roman Empire by the fourteenth century was a weak pretender to the ancient empire whose name it partially claimed, the ancient Roman Empire. Nonetheless, the political prestige and rank of the Holy Roman Emperor among European monarchs pointed to the continuing power of the *idea* of the Roman Empire in late medieval and early Renaissance western Europe. For the educated class, in particular, empire also referred to the other competitor for the title of true heir of ancient Rome, namely the Byzantine Empire centered in Constantinople.

While both the western and eastern empires ruled over a small fraction of the territories once ruled by Rome, they both claimed to be direct descendants from ancient Rome to increase and legitimize their political status. Thus, the meaning and memory of empire in the ancient Roman sense of the word was never far beneath the surface in the political and historical commentaries on empire in the late medieval period. Dante's *Divine Comedy*, for example, made many references to the ancient empire while stopping short of providing any substantial historical or political reflection on the Roman imperial model.

Petrarch and the Renaissance Rupture with the Medieval Idea of Empire

The clear rupture with the medieval idea of empire that entertained a romantic notion of continuity between ancient Rome and medieval Europe came with the writings of Francesco Petrarch (1304–74), the father of Renaissance humanism in the fourteenth century. He was the first to develop a more expansive and detailed meaning of empire that aimed at reviving ancient Roman

imperial greatness and the fullness of its past political meaning. More specifically, it was in Petrarch's letters and his historical writings that we find expansive reflections on the ancient Roman Empire that inspired a large body of humanist literature on that theme in the following centuries and that established what we can describe as the Renaissance philosophy of empire. Aiming for nothing less than the rebirth of the ancient Roman Empire in all of its intellectual, cultural, military, and political grandeur, this *imperial humanism* privileged historical writing above other modes of scholarly analysis (Dandeleit 2014). Indeed, it was history that was the "teacher of life" for Renaissance writers reflecting on the meaning of ancient Rome and its empire.

A foundation stone of this literature, for example, was Petrarch's "Life of Julius Caesar," a long biography of the first emperor included in the author's largest historical work entitled the *Lives of Illustrious Men* (Petrarch 2007). It presented Caesar as one of the greatest military leaders who had ever lived, and the person who had imposed upon Rome and all of its conquered territories **the rule of one**. This was a central principle and defining characteristic of empire for humanists throughout the Renaissance, and again, it was Petrarch, in one of his letters focused on the ancient Roman military, who explained the idea concisely using the Roman Empire as the central example: "With its valor and arms it overcame Italy, Europe and the entire world, and ordered it to be content with one ruler" (Petrarch 2005: 251).

For Petrarch, the purpose of studying the Roman Empire and the Caesars was anything but antiquarian. Rather, the ancient ideas and example of empire were held up as models to the rulers of his own day. The Holy Roman Emperor Charles IV, for example, was encouraged by Petrarch to follow the example not of his Germanic predecessors but of the ancient Roman emperors. That was the path to glory, honor, fame, and real military strength. Broadly speaking, it was Petrarch's emphasis on the primacy of the ancient Roman Empire as the imperial ideal that came to dominate the scholarly focus and meaning of empire for Renaissance Europe.

The Flowering of Imperial Humanism in the Fifteenth Century

Prominent fifteenth-century Italian humanists including Guarino Guarini (1374–1460) and Flavio Biondo (1388–1463) followed Petrarch's lead in turning their attention to the ancient Roman Empire both as scholars and as political advisors. Guarino's new edition of Caesar's *Commentaries* (1433), dedicated to the marquis of Ferrara, Leonello d'Este (1407–1450), served as a pedagogical text for the young ruler as it explicitly called upon him to imitate Caesar and the politics of the rule of one, albeit in the limited setting of Renaissance Ferrara. At the same time, the idea of empire also inspired the transformation of the material culture of the city as Leonello commissioned a new equestrian statue of his father, Niccolò d'Este, from two disciples of Brunelleschi in the classical Roman style. Artistic representation in the form of statues, medals, paintings, and palaces subsequently joined new literary productions as part of the language of empire in Renaissance cities. These were the most innovative, original, and transformative aspects of the meaning of empire in the early Renaissance, and they set the stage for the next two centuries.

In some instances imperial texts and images went hand in hand as in the case of Flavio Biondo (1392–1463) and Andrea Mantegna (1431–1506) who produced, respectively, a text and series of paintings on the theme of ancient Roman triumphs. Reviving the memory of imperial victories, conquest, and the accompanying rewards of the ritual triumphs awarded to Roman generals added further meaning and depth to the idea, ambition, and lure of empire. Dedicated to the papal rulers of Rome in the case of Biondo's text, *Rome Triumphant*, and to the Gonzaga rulers of Mantua in the case of Mantegna's paintings, both works articulated an exalted image of empire that begged imitation from rulers for whom real empire was but a distant fantasy (Biondo 1544). From Biondo's perspective, especially, the Roman Empire was presented as the political ideal that united the peoples of the Mediterranean world through language, law, commerce, and

culture. In the fourteenth and fifteenth centuries, this was the political dream of many rulers, even if it remained a far off fantasy.

But the sixteenth century witnessed political developments that transformed the meaning of empire in both theory and practice. More precisely, it was the global empire of the Holy Roman Emperor, Charles V (1500–1558), that constituted a European empire that surpassed even the Roman Empire in its geographical size, wealth, and military power. As such, it was also the first Renaissance empire to actually realize many of the goals of imperial revival advanced by Petrarch and his disciples over the previous two centuries. The hybrid empire of Charles V was created first through the dynastic alliance of the Spanish monarchs Ferdinand and Isabella and the Habsburg Holy Roman Emperor Maximilian. They collectively left to their grandson, Charles V, all of the Spanish kingdoms in Iberia except Portugal, the Caribbean territories in the New World, the kingdoms of Sicily and Naples, the Balearic islands, and the Habsburg territories in Germany and the Low Countries. Charles V added to these through conquest two previously sovereign empires of the Inca and Aztecs in the New World, and the Duchy of Milan.

Perceived as a new Caesar not only in title but also in “theory, authority, and power,” as the Florentine historian Francesco Guicciardini (1483–1540) described him, Charles V and his empire established the meaning of Renaissance empire as a realized political entity that both equaled and surpassed the previous model of ancient Rome (Guicciardini 1857: 384). Conquering previously sovereign empires and extracting huge sums of wealth from these new colonies to fund large armies, navies, and colossal building projects and artistic programs, this empire also coincided with numerous humanist texts that expanded upon the meaning of empire for the newly emerging imperial era (Pagden 1995).

Among the earliest of these was Niccolò Machiavelli’s *Art of War* (1521) that took as its main protagonist one of the most celebrated Italian generals of the empire of Charles V and his grandfather Ferdinand, the Roman nobleman Fabrizio Colonna. Presented as a real dialogue

that took place in the Rucellai gardens in Florence between Fabrizio and the Rucellai prince, the text revolved around the Colonna general’s reflections on war both ancient and contemporary. While the example of the Roman Republic dominated the first chapters of the book, by the end of the text, it was the ancient Roman Empire and Julius Caesar that provided the most useful examples and lessons for the waging of war. Like *The Prince*, *The Art of War* was thus marked by an imperial turn as it provided instructions for rulers who sought to impose the rule of one. The Republican age was passing as the theories and practices and ideologies of empire came to dominate European political thought, a development that the debate over the rights and legitimacy of the Spanish Empire in the New World highlighted (Pagden 1990).

Prompted by the criticism of the Spanish conquistador turned priest and advocate of Indian rights, Bartolomé de las Casas (1474–1566) in his famous treatise *A Brief Account of the Destruction of the Indies*, a formal debate over whether the wars of conquest were justifiable was ordered by Charles V in the early 1550s. His royal historian, Juan Ginés de Sepúlveda (1489–1573), a scholastic theologian trained at Alcalá and Bologna, argued against Las Casas that the war was justified using a combination of Aristotelean natural law theory and the historical example of ancient Rome. In his treatise, *Democrates Segundo*, Sepúlveda, following St. Augustine, argued that “God conceded to the Romans a very expansive and glorious empire to impede the great evil that spread among many people” (Sepúlveda 1997: 63). Just as the superior civilization of the ancient Roman Empire justified their conquest of so many inferior peoples and the enslavement of those who lacked the marks of civilization, so too the superior civilization of the Spanish Empire justified their conquest of the native peoples of the Americas. Merging the tools of Aristotelean natural law theory applied to contemporary conquest and humanist history rooted in the example of ancient Rome, Sepúlveda subsequently bolstered the political philosophy of empire for the supporters of the Spanish imperial project.

In the same period, another Spanish royal historian, Pedro Mexia, added to the Renaissance understanding of empire with an important piece of humanist history entitled *Historia Imperial y Cesarea* (Mexia 1547). Dedicated to Philip II (1527–98), the son of Charles V, the work urged the prince to not only learn from the emperors dating back to Julius Caesar but to move beyond them. It was a challenge Philip II accepted, and when he conquered Portugal in 1580 adding all of that empire's lands to his own, he created the largest global empire in terms of territory that the world had ever known. Empire in the second half of the sixteenth century first and foremost meant the Spanish Empire. The old Holy Roman Empire ruled over by Philip II's uncle was a medieval shadow of the new Rome, a title increasingly given to the Spanish empire by a long line of humanist writers and artists.

This new political reality of empire inspired envy and competition among Spain's foes, primarily the French and British, who increasingly pursued imperial ambitions of their own in the late sixteenth and seventeenth centuries. For the French monarchs, Jean Bodin's text, *The Six Books of the Republic* (1576), was a central example of a high Renaissance political treatise and that drew upon the history of ancient Rome as a political model while also including an extensive reflection on Roman law. The combination of historical and legal analysis was described by Bodin himself as the new discipline of political science. At its heart was the common imperial humanist premise that "The Romans had the greatest empire that ever was" (Bodin 1606: 620). It followed that the political lessons that he drew from ancient Rome encouraged expansive monarchical power and a military agenda that include maintaining a strong standing army as did Augustus.

Both the French and British humanists followed the lead of the Italians in reviving the texts and memories of the Caesars and the ancient Roman Empire, but it was the Spanish Empire that their monarchs sought to imitate and displace in the New World. Colonies were central to the meaning of Renaissance empire, and by the middle of the seventeenth century, the French

and British had claimed parts of North America and the Caribbean for their own. With the colonies they also claimed the title of empire, and increasing numbers of French and British humanists described their monarchs as emperors and their collective kingdoms as empires (Armitage 1998). Thus by the late Renaissance, the term empire was used by multiple European powers all competing for the title of heir to ancient Rome.

The fact that Renaissance imperialism had given birth to numerous new empires by the late seventeenth century also contributed to increasing scholarly reflection on the meaning of empire. A large collection of essays produced by members of the Palatine Academy of Naples between 1698 and 1700, for example, produced over 127 essays one-third of which focused on themes related to the theme of empire. As a late Renaissance production, this work represents a culminating synthesis of the meaning of empire in its most expansive and mature form. Themes and interpretations ranged widely from the dominant school of very positive Petrarchan reflections on the best individual ancient emperors, to more nuanced philosophical reflections on the origins of empire, to a quite negative critique of empire as a whole. At one end of the spectrum, the author Gregorio Calaprese, in his essay "The Origins of Empire," saw empire as a divine remedy to human weakness: people "are constrained to create a person above them, with authority to make laws and impose penalties and prizes with the goal of obligating everyone to act within the boundaries of honesty and justice. It is this which constitutes the nature of empires" (*Raccolta*: f. 48r). At the other end of the spectrum, the anonymous author of an essay entitled "On the Roman Empire" concludes after recounting the violence of the civil war that gave birth to the Roman Empire that "Every new Empire, as Rome then was, is violent and hateful" (*Raccolta*, f. 326 v).

By the end of the Renaissance, then, the meaning of empire had been complicated by the emergence of new empires as well as by a large body of scholarship on ancient Rome. Subsequently, the most substantial development in the philosophy of empire in the Renaissance was that it had gone

from being a largely academic reflection on empire lost to being an urgent and pressing reflection on the consequence of European empires reborn. The revival of imperial ambition had an unmatched impact on the development of European and global political life as the dream of a Renaissance of empire as an intellectual, cultural, and political project became the dominant master narrative that drove European political life for over four centuries. Moreover, the numerous global empires that reshaped the world during the early modern period set the stage for even more expansive nineteenth- and twentieth-century European empire building, the most lasting legacy of Renaissance Empire for better or worse.

Encyclopedia and Encyclopedism

Christopher D. Johnson
The Warburg Institute, London, UK

Abstract

Renaissance encyclopedism can be understood in terms of the history of problems, the history of concepts, book history, and cultural history. Remaking classical and medieval models, encyclopedic writing ranged from modest plans to provide a “general education” to the impossible ideal of securing universal and complete knowledge in all the sciences. Given a changing disciplinary map, the flood of books, and new epistemological criteria, the notion of encyclopedic *paideia* increasingly competed with more systematic, if often idiosyncratic, efforts to order, transmit, and evaluate kinds and quantities of knowledge. Prospective as well as retrospective, synchronic and diachronic, propelled by the timeless desire to “know all” while responding to historical contingences of all kinds, Renaissance encyclopedism undertook a massive, multifaceted *translatio studiorum* variously driven by pedagogy, philology, antiquarianism, curiosity, faith in scientific and philosophical progress, as well as numerous material, cultural, and political motives. Central to this *translatio* was the problem of finding the correct order for organizing materials. Some encyclopedic writers followed a Plinian model which encouraged adducing ever more material without overmuch concern for contradiction; others preferred either the Platonic-Stoic

or Aristotelian division of the disciplines; still others made the liberal arts their model; more analytic orders were also cultivated, as was, conversely, alphabetical order. Whatever order was adopted, though, compilation and the use of the commonplace book were generally the rule. Sites and genres of encyclopedic knowledge were as numerous as they were varied: from the book to the museum, from the miscellany to the *theatrum*.

Synonyms

Circle of learning; Paideia; Pansophy; Polyhistory

Heritage and Rupture with Tradition

As distinct from its Enlightenment successors, Renaissance encyclopedism assumed a wide variety of discursive and material forms, particularly as the classical ideal of attaining sufficient knowledge of all the liberal arts was transformed in the course of the sixteenth and seventeenth centuries into systematic attempts to secure complete and unified knowledge of all subjects. At once synchronic and diachronic, such encyclopedic writing represented a timeless *desideratum* shaped by concrete contingencies and shifting historical forces. As the sixteenth-century Aristotelian natural philosopher Ulisse Aldrovandi observed, recycling an ancient Greek maxim: “Nothing is sweeter than to know all things” (Aldrovandi 1645). Or as the seventeenth-century pansophist Johann Amos Comenius wrote, with one eye on Plato and the other on Francis Bacon, the hope is to teach “omnes omnia omnino” (“all people all things in light of the All”) (Comenius 1960). Such idealism notwithstanding, Renaissance encyclopedism was also a belated, derivative form of thought that tried to inventory and organize what others had written, even as it endeavored, though with limited success, to respond to the mathematization of nature promoted by the “new science” and to mediate the explosion of empirical facts (especially as the *orbis terrarum* expanded with the discovery of the New World) and other forms

of “early modern information overload” (Rosenberg 2003). It was encouraged, that is, by the invention of the printing press, which precipitated an enormous growth in the publication and circulation of old and new texts. Further, as with Pliny the Elder’s *Naturalis historia* written in imperial Rome, Renaissance encyclopedic writing was informed by a culture of curiosity and collecting (Goering et al. 2013) and, less benignly, as it acquired political and economic value, by imperialism and colonialization.

Renaissance encyclopedism was both utopian (Schmidt-Biggemann 1983) and destined to fail. As a central vehicle for the *translatio studiorum*, it aimed eventually to encompass all knowledge and to save the classical legacy from another eclipse; but it also reflected the growing historical consciousness that such knowledge might be incorrect, in need of contextualizing or supplementing in the light of new discoveries, theories, and methods. In brief, Renaissance encyclopedism ranged from the purely retrospective to the increasingly prospective. Its history, accordingly, can also be viewed through the prism of changing emphases on authority, reason, and experience. As Renaissance humanist habits of mind underwent greater scrutiny, authority, as a form of cultural memory, became pejoratively associated with mere opinion. Encyclopedic writing, in turn, tried to find forms of representation that could mediate between old and new learning. Bacon, for example, targeted those humanist and cognitive modes that fueled most species of Renaissance encyclopedism, even as he wanted to reconfigure the encyclopedia according to his novel program for the “advancement of learning” (Bacon 2000, 2004).

As for precedents, Renaissance encyclopedism was partially rooted in late classical and medieval thought. Works by Martianus Capella, Isidore of Seville, Bartholomaeus Anglicus, Vincent Beauvais, and Raimond Llull were edited and widely read throughout the period. And in attempting to give such encyclopedism novel, less static form, Renaissance authors reworked the medieval metaphors of the *theatrum mundi* and the Book of Nature, even as they supplemented these with metaphors associated with the circle,

journey, path, labyrinth, architecture, digestion, bees, etc. Isidore of Seville's seventh-century *Etymologiae sive Origines*, with its 448 chapters in 20 books, offered medieval readers a *summa* of classical knowledge about a nearly vanished world and the meanings of the Latin words which described that world. But reprinted in 1599 in a heavily annotated edition sponsored by Philip II of Spain, its *mise-en-page* at once confirms and undermines the original text's authority. Further, while vernacular texts and translations constituted a relatively small, if growing, portion of early modern encyclopedic writing, it was mainly Latin's universality that enabled encyclopedism to become a primary vehicle of humanism and that facilitated the migration of encyclopedic texts and notions about content (*inventio*) and arrangement (*ordo* or *dispositio*) across Europe and the Americas.

Renaissance thinkers also mined a variety of classical encyclopedic models: Pliny's omnivorous *Naturalis historia*; Valerius Maximus' eclectic *Factorum et dictorum memorabilium libri IX*; Solinus' thoroughly derivative and unsystematic *Collectanea rerum memorabilium*; the motley, pseudo-Aristotelian *Problemata*; and Quintilian's *Institutio oratoria*, with its pragmatic notion of what an orator's general education or *orbis doctrinae*, which translates the Greek ἐγκύκλιος παιδεία, should be (I.10.1). These canonical texts provided Renaissance encyclopedic writers with matter and words (*res et verba*) to be imitated, adapted, and, increasingly, challenged.

Other, more structured, classical models were used to order the human sciences. One model followed the seven liberal arts: grammar, rhetoric, logic, arithmetic, geometry, music, and astronomy. Alfonso de la Torre's *Visión delectable de la filosofía y artes liberales, metaphísica y filosofía moral* (1435) refashions *De nuptiis Philologiae et Mercurii*, Martianus Capella's early fifth-century allegorical journey through the *artes liberales*. An oration attempting to classify all the branches of learning, Angelo Poliziano's *Panepistemon* (c. 1492) envisions a "philosophy" beyond the reductive confines of the Aristotelian *cursus philosophicus* to include not only all the liberal arts but also the mechanical

arts, even cooking and carpentry (Poliziano 1994). An impossibly ambitious program, the *Panepistemon*, nonetheless spurred more realized efforts, such as Symphorien Champier's *Libri VIII de dialectica, rhetorica, geometria, arithmetica, astronomia, musica, philosophia naturali, medicina et theologia, et de legibus et republica eaque parte philosophiae quae de moribus tractat* ... (1537), and Conrad Gesner's *Pandectarum sive partitionum universalium ... libri XXI* (1548). More influential, though, was Gregor Reisch's *Margarita philosophica* (1503), a carefully structured, twelve-book compendium meant to teach boys the liberal arts as well as natural philosophy, natural history, faculty psychology, and moral philosophy. Reisch's diagrammatic illustrations and tables also played instrumental roles in his pedagogy (Siegel 2009; West 2002, 24–28).

Another model corresponded to the Aristotelian division of philosophy into theoretical, practical, and poetic (or productive) philosophy – a triad often conceived via the categories furnished by faculty psychology: reason, memory, and imagination. Bacon relies on this schema in *Instauratio magna* (1620), where he redefines each faculty to meet the needs of his experimental program. Indeed, one way of grasping Renaissance encyclopedism is to track the shifting emphases put on these three faculties: most accounts stress the interplay of memory and reason, but others stubbornly focus on the imaginative aspects of encyclopedic writing (Kenny 1991).

Alternatively, some Renaissance encyclopedists adapted the Platonic-Stoic division of the sciences into logic (or metaphysics), ethics, and physics. Borrowing from a bevy of authors, Pierre de la Primaudaye's *Academie françoise* (1577–98) begins with a volume on ethics, followed by two volumes on natural history and natural philosophy, and then a fourth volume dedicated to "Christian philosophy" or religious doctrine. Reacting in part to Michel de Montaigne's skepticism, La Primaudaye's text proved popular in France and abroad – both Shakespeare and Bacon used it. A century later, G. W. Leibniz' *De ratione perficiendi et emendandi Encyclopaediam Alstedii* (1669–1671) and – in the course of

refuting Locke's philosophy – *Nouveaux essais sur l'entendement humain* (1704) urge that the Platonic-Stoic division of knowledge be given new, encyclopedic unity. Such unity abandons all previous attempts to classify and to define and delimit content; instead, it consists in a “metaphysics of a referential system” (Selcer 2010, 78) which enables each proposition to potentially entail every other proposition.

Innovative and Original Aspects

In the fifteenth century and throughout much of the sixteenth, the *encyclopaedia* signified a pedagogical ideal that no longer corresponded to its classical origins. Humanists misread, that is, the Greek phrase, ἐγκύκλιος παιδεία, which they found in Quintilian and Pliny, so that it came to denote not “general learning” or *paideia*, but rather an ever growing “circle of learning” (*orbis doctrinae*) and, eventually, an exhaustive, systematic knowledge of all things, often in the material form of a book (Dierse 1977; König and Woolf 2013). *Paideia*, or being well educated in the *trivium* and *quadrivium*, did not suffice, nor did efforts to reform the curriculum. Instead, a second ideal emerged, which saw the encyclopedist trying to compile, arrange, and systematize all that had been written about the human sciences (including now the mechanical arts). In the course of the Renaissance, then, there was a shift from encyclopedism as pedagogy to encyclopedism as synthesis or analysis, by means of which the dream of universal and complete knowledge was pursued. As Johann Heinrich Alsted writes in *Philosophia digne restituta* (1612): “Philosophia est omnis scibilis cognitio” (“Philosophy is the understanding of all knowable things”). Alternatively, in England, Bacon envisioned a new kind of encyclopedism grounded in empirical natural philosophy, so did, though with less consistency, Federico Cesi and his colleagues in the Roman Academy of the Lynx-Eyed (Accademia dei Lincei). Meanwhile, there were also more idiosyncratic, imaginative encyclopedic writers, like François Béroalde de Verville and Thomas Browne, who did not so much try to compass the “circle of learning” as to explore and exploit its gaps. Many

encyclopedic writers, especially in paratexts, expressed the irony and pathos of their impossible undertaking, even as their texts proper continue to accumulate unmediated particulars. Montaigne mined his encyclopedic intertextuality to know himself better; as he writes in “Of Experience” (1580): “I have a dictionary wholly to myself” (“J’ai un dictionnaire tout à part moi”). But whether idealist or skeptical, objective or subjective, encyclopedic writers tended to adopt a rhetoric – fueled by figures like parataxis, digression, asyndeton, *distributio*, and *systrophe* – that strove to enumerate, to distinguish, but also to exhaust.

More specifically still, the few sixteenth-century works that featured “encyclopaedia” in their titles were as much treatises on the organization of knowledge as they were containers of encyclopedic content. And even then, the problem of finding the best order was never quite resolved. Praised by Erasmus and later reedited by Girolamo Cardano, Joachim Sterck van Ringelberg's *Lucubrationes vel potius absolutissima kyklopaideia* (1538) ends with a miscellany entitled *Chaos*, which invokes Ovid to justify its jarring juxtaposition of subjects. Notwithstanding its debts to Lullism and the cabala, Paul Skalich's *Encyclopaedia seu orbis disciplinarum epistemon* (1559) often devolves into a kind of Rabelaisian list. In other instances, the “circle of learning” was idiosyncratically or narrowly drawn. Mario Nizolio's Ockhamist Ciceronianism motivates *De veris principiis et vera ratione philosophandi contra pseudo-philosophos* (1553), four volumes that would marry philosophy and eloquence in order to teach the correct “circulus doctrinarum omnium, sive encyclopaedia” – an effort lauded by Leibniz in a preface for a later edition. By contrast, the Erasmian Juan Luis Vives composed *De disciplinis Libri XX* (1531), which consists of three treatises: *De causis corruptarum artium*, *De tradendis disciplinis*, and *De artibus*. Espousing a practical epistemology, which values knowledge gained by experience and doing (a kind of “maker's knowledge”) and so also eschews the pursuit of metaphysical truths, Vives critiques contemporary education and its reliance on scholastic language in order to offer his own reform

program. The humanist, he writes, should be both a “philologist” and a “polyhistor” – the latter, versed in multifarious experience, embodies the ethical ideal of “prudence.”

As these examples suggest, *ordo* was the chief problem riddling Renaissance encyclopedism. Alphabetical order was adopted in most sixteenth-century lexica, but occasionally in other genres, too, such as Domenico Nani Mirabelli’s miscellany *Polyanthea* (1503) and Conrad Gesner’s groundbreaking, annotated bibliography *Bibliotheca universalis* (1545). Yet alphabetical order, for all its indexical utility, had no intrinsic meaning, and so given the early modern thirst for ontological and other hierarchies, it became the rule only toward the end of the seventeenth century (Blair 2010). And while a few thinkers effectively attempted to reconcile encyclopedism with the law of noncontradiction (e.g., Jean Bodin used dialogue to weigh conflicting views), most embraced the implicit principle that it was best to adduce all that has been written about a topic without worrying too much about harmonizing divergent views. In brief, compilation (*compilatio*) rather than selection dominated – a manner of thinking and writing that goes hand in hand with the vastly greater availability of printed texts in the Renaissance. These copious texts adduced methods, ideas, and controversies of all kinds. Still, the hope of finding the proper order remained a constant. As Alsted writes at the beginning of his *Encyclopedia, septem tomis distincta* (Alsted 1630, 1), which aims to be the most systematically constructed encyclopedia: “ORDINE nihil pulchrius, nihil fructuosius esse nemo non videt Ordo siquidem in amplissimo hujus mundi theatro rebus omnibus conciliat dignitatem, et ipsarum est velut anima” (“Nobody has seen anything more beautiful, nothing more fruitful, than order Order provides worth to all things in the widest theater of this world and is like their very soul”).

Yet given the constitutive tension between order and variety – a permutation of the perennial dialectic between the one and the many – that informs all encyclopedic efforts, unsurprisingly, Renaissance encyclopedism featured competing,

often conflicting, methods and epistemologies (Rossi 2000; Vasoli 2005). In the sixteenth century, as religious authority waned, as Aristotelians (in Padua, Oxford, and elsewhere) grappled with the status of universals, as the gathering of empirical facts or “secrets” and the affirmation of mathematical truth claims became more central, and as varieties of ancient skepticism, the shape and status of encyclopedic knowledge were contested with more and more fervor. One exemplary clash is between the polymathic, Neoplatonic Cardano and the more skeptical, Aristotelian J. C. Scaliger (Maclean 1984). Cardano composed the wide-ranging *De subtilitate* (1550); Scaliger responded with the scathing, massive *Exotericarum exercitationum liber XV de subtilitate* (1557). Both encyclopedic texts vainly pretend to epistemological and methodological superiority: whereas Cardano finds subtlety in nature and our understanding of nature, Scaliger blames Cardano for having an overly subtle imagination. Alternatively, in a late work like *De triplici minimo et mensura* (1591), Giordano Bruno promotes an encyclopedic method which insists that to know something in mathematics is always only a partial truth, as it also must be mirrored by natural philosophical and metaphysical knowledge. Put another way, even if the utopian avatars of encyclopedic thought (e.g., Cardano (2004), Bruno, Tommaso Campanella, Bacon, Comenius, Leibniz) have their skeptical counterparts (e.g., Heinrich Cornelius Agrippa, J. C. Scaliger, Béroalde de Verville, Robert Burton), the utopian strain tends to reemerge in new forms. But again, such idealism is always shaped by different biographical, cultural, and political circumstances. Athanasius Kircher’s numerous pansophic efforts, for example, relying partially on a global republic of letters facilitated by his position as head of the Jesuit Collegio Romano, were rooted in the cultural politics of Counter-Reformation Rome, which valued an eclectic, but not heterodox, version of antiquarianism (Stolzenberg 2013).

Another epistemological fault-line riddling Renaissance encyclopedism was between Plinian natural history, on the one side, and Baconian natural history and natural philosophy, on the other. The Plinian model encouraged the

gathering of particulars, *res et verba, naturalia et artificialia*, without overmuch concern for their veracity or for larger structural, organizational questions. Yet Plinian natural history was, of necessity, reconsidered in light of early modern European discoveries in the Americas, Asia, and Africa. Most obviously, encyclopedic histories of the New World became a primary vehicle of Spain's *translatio imperii* and *translatio studii*. In metaphorical terms – though a metaphor with ontological pretensions – the Book of Nature was rewritten by transatlantic discovery and conquest. The encyclopedist's task was now to rewrite this book, to produce new verbal *copia*, new *tesoro* (treasure), out of novel flora, fauna, peoples, customs, and beliefs (Hernández 2000; Bleichmar and Mancall 2011). Encyclopedic writing in the Middle Ages and throughout the early Renaissance confidently ransacked classical sources: Virgil was an authority on agriculture, Livy on political history, and Strabo on geography, etc. But in sixteenth-century transatlantic encyclopedism, classical authority was everywhere undermined (Cañizares-Esguerra 2006). Just as the flood of books, an ascendant empiricism, and the waning of eschatological certainty prevented encyclopedists who remained in Europe from closing the *orbis doctrinae*, the experience of New World novelty led to an ineluctable awareness of the imperfection of classical sources. Such novelty was cartographic, ethnographic, zoological, botanical, even, at times, theological, but it also had a second-order, cognitive effect whereby questions of how to represent such novelty, how to limit multiplicity, and how to forge unity out of this multiplicity acquired new force and urgency.

In his *Historia general y natural de las Indias* (1536–42), Gonzalo Fernández de Oviedo initially follows Pliny's *dispositio*, which begins with cosmographical matters, then considers, in turn, animals (including humans), fish, birds, insects, plants, and minerals, while interspersing throughout accounts of the arts and mores. But in the event Oviedo's massive *Historia* (the first 19 books published in his lifetime, 31 posthumously) falls back on a geographical rather than a topical structure. It also vaunts the primacy of firsthand experience over Pliny's bookish

authority. Oviedo boasts of writing “as copiously as the subject matter,” even as he underscores how the brevity of a single historian's life and a dramatically enlarged world (in comparison with antiquity) greatly complicates his task (Oviedo 1944–45).

By contrast, Bernardino de Sahagún's *Historia general de las cosas de la Nueva España* (1579) was initially conceived as the pedagogic means of instructing the indigenous population of Mexico who had survived the Conquest. Loosely adapting the *ordo* of Bartholomew Angelicus' Aristotelian *De proprietatibus rerum* (c. 1240), which was translated into Spanish in 1529, Sahagún relied on Nahua *informantes*, scribes, and translators for much of his material. Written in Latin, Spanish, and Nahuatl, his *Historia* offers a comprehensive account in twelve books of Nahua deities and religion, astronomy, ethnography, rhetoric, government, vocations, natural philosophy, and political history (ending with Tenochtitlan's fall). The 2,400 thousand pages and 1,850 illustrations of the version of the *Historia general* known as the *Florentine Codex* constitute the first great flowering of New World encyclopedism and a founding document of Mexican *mestizo* culture. While presenting his text as an instrument of conversion, Sahagún, defying post-Tridentine orthodoxy and the perceived interests of Crown and Church, also defends the subtlety and breadth of the Nahua circle of disciplines. Furnishing the *indios* with an encyclopedic account of their culture, he regrets, though, his failure to alleviate their suffering (Sahagún 1990).

For his part, Bacon first wanted to cure various “distempers” of learning (2000), or as he later puts it, to destroy false “idols” which haunt the “human intellect” (2004). Secondly, and more positively, he sought to reorient the encyclopedia around a reformed natural philosophy, whose methods and “progress” were to be paradigmatic for the other disciplines. To this end, the Baconian model encourages the collection of particulars, but judiciously as a part of an inductive method to reach axioms and laws that might then direct the collection of further particulars by distinguishing them from extraneous matters and mere verbiage. In the preface outlining the scope and content of his

never-to-be-completed *Instauratio magna*, Bacon writes: “Now to the human intellect reflecting on it, the fabric of the universe looks in its construction like a labyrinth, where we find everywhere so many blind alleys, such deceptions and misleading signs (*tam fallaces rerum et signorum similitudines*) and such oblique and intricate convolutions and knots of nature. But the journey has always to be made through the woods of experience and of things particular (*per experientiae et rerum particularium sylvas*), guided by the uncertain light of the sense which sometimes flares up and at others dies down” (Bacon 2004, 18–19). Such *sylvae* threaten to become labyrinthine if not illuminated by a proper method that would allow Bacon to be “engaging purely and unceasingly with things.” The encyclopedic natural historian’s initial task, then, is to distinguish these “woods” from “misleading signs,” to discern differences between *res et verba*. (In this way, Bacon skirted another question roiling some instances of Renaissance encyclopedism: whether language is realist or nominalist.) Yet such efforts never entirely succeeded – as Bacon’s own motley *Sylva Sylvarum* (1626), meant to be a cornerstone of the *Instauratio magna*, confirmed. Alternatively, while Descartes’ epistemology sharpened the criteria of what could be known clearly and distinctly – thereby culling what he perceived to be humanist, that is, encyclopedic error and excess – tellingly, his 1619 dream vision, the *Olympica*, which inspired his *prima philosophia*, features a single book, a “dictionary” which “gathered together all the sciences” (Descartes 1908, 10, 179–88).

Given all this, Umberto Eco’s distinction between a “Dictionary” and an “Encyclopedia” model of semantic representation greatly helps to illuminate the dynamics of Renaissance encyclopedism (Eco 1986, 2010). The “Dictionary” offers a limited set of definitions and deductions, the “Encyclopedia” endless descriptions and inductions. But this distinction is more than just a formal one; Eco also identifies a historical transition in the late Renaissance from logical representation that sought the “Utopia of a Porphyrian tree” in the “Dictionary” to writerly expression generated by the “the idea of the labyrinth” in

the “Encyclopedia.” In short, any synchronic or diachronic attempt to exclude contingencies (*accidentia*) and their real and potential encyclopedic relations from accounts of the nature of things was doomed to fail. Or as Michel Foucault’s *Les mots et les choses* (1966) suggests, the Renaissance “episteme” of “resemblance” encouraged more varied kinds of encyclopedic writing than did the subsequent, classical “episteme” of “identity and difference.”

Further, if “Renaissance encyclopedism is primarily a question of genre” (Kenny 1991, 56), then throughout our period encyclopedic genres were very much in flux, in part because the relations between words and things were also extremely fluid. Explicit and implicit debates about *dispositio* fostered a remarkable variety and fluidity of genres, including the catalogue, *biblioteca*, digest, lexicon, thesaurus, commentary, miscellany, essay collection, *theatrum*, natural history, anatomy, atlas, as well as the encyclopedia itself. Exemplary of this generic variety is Poliziano’s *Miscellaneorum centuria prima* (1489), 100 brief essays on specific philological problems that also call for encyclopedic learning and the philosophical interpretation of texts. Alternatively, Juan Pérez de Moya wrote a digest or handbook, *Philosophia secreta* (1585), which leans heavily on Giovanni Boccaccio’s and Natale Conti’s Latin compendia of classical mythology. Translating them into Spanish and reordering their material topically (with the help of an alphabetical index), Pérez de Moya also gave the concept of the “secret” new natural-historical, hermetic, and, above all, moral meanings. More systematic is Bodin’s now Aristotelian, now Plinian *Universae naturae theatrum*, 1596 (translated into French in 1597 as *Le theatre de la nature universelle*), which eclectically, but dialectically, organizes natural philosophical material drawn from his commonplace books into ten hypostases that follow the chain of being from simpler substances to more complex ones, thus showing the way to natural theology. In practice, however, Bodin’s *Theatrum* “often meanders from one topic to the next following no pre-existing logic” (Blair 1997, 30). Then there is Antonio Zara’s nearly 700-page *Anatomia*

ingeniorum et scientiarum (1614), which consists of four *sectiones* containing 54 *membra*. The first section treats the dignity and excellences of man (18 members), the second the sciences of the imagination (16 members), the third the sciences of the intellect (eight members), and the fourth the sciences of memory (12 members). This Aristotelian schema, along with marginal signposts and a detailed 70-page index, enables Zara to consider individual topics in a succinct if also thoroughly intertextual and usually quite credulous manner. Zara, in turn, became one of many models for Burton's inimitable *The Anatomy of Melancholy: What it is. With all the kindes, causes, symptomes, prognostickes & severall cures of it. In three maine Partitions, with their severall Sections, members & subsections. Philosophically. Medicinally. Historically opened & cut up* . . . (1621). However, that Burton despairs that his all-encompassing, humanist learning, his "Encyclopedian," will satisfy his readers or, more urgently, cure his own melancholy, is symptomatic of the subjective doubts affecting much seventeenth-century encyclopedic writing. Indeed, if generic variety and fluidity confirm the dynamism of Renaissance encyclopedism, then they also hint at its methodological inconsistencies, if not aporias. Further, as the elaborate synoptic charts of Burton's *Anatomy* exemplify, there was a crucial dependence in the period on illustrations, diagrams, tables, and maps in the effort to support or clarify the *copia* of discursive claims – even if these visual forms reveal significant epistemological tensions as well (Siegel 2009).

This is also to say that Renaissance encyclopedism was driven by the compulsion to compile. Such *compilatio* may be viewed as augmenting and renovating static medieval models with new material or, conversely, as spurning more abstract, systematic attempts to order materials. In this regard, encyclopedic writing often became a rabid form of intertextuality, one oblivious to or disdainful of the contradictions created by the unmediated addition of more and more voices, opinions, facts, etc. The history of early modern encyclopedic writing is therefore partially the study of the reading and study habits of the learned – specifically of the fundamental role of

commonplace books in the compositional process (Blair 2010). And while most encyclopedic writing presents itself as an individual rather than collective work, as soon as its intertextuality is considered, this distinction tends to collapse.

Compilatio, following various philological and irenic principles, fueled the "heroic" lexicography of early modern Europe (Considine 2008). For example, Niccolò Perotti's *Cornucopiae, sive linguae Latinae commentarii diligentissime recogniti* . . . (1489), nominally a commentary on Martial's epigrams, becomes in the course of its glosses an encyclopedic account of Roman culture. Perotti's text later provided a great deal of the material used by Ambrogio Calepino in his influential alphabetical Latin dictionary (1502, 1509), subtitled *Cornucopiae*. With entries featuring extracts from many classical authors, Calepino's lexicon was expanded and reprinted dozens of times during the sixteenth century by other lexicographers, who effectively transformed it into a polyglot dictionary. *Compilatio* was also the rule in natural history. Theodor Zwinger's *Theatrum vitae humanae* (1565) casts itself as a form of moral philosophy, a "human natural history," rather than a Plinian "natural history of the universe." Borrowing from Aristotle and Petrus Ramus for his *dispositio*, in the course of later editions (1571, 1586), Zwinger triples the book's size and organizes its content more loosely. Although reflecting more on the difficulties of ordering the disciplines, and notwithstanding the analytic complexity of its indices and synoptic diagrams, the *Theatrum* puts growing emphasis on particulars, mainly by mining the commonplace tradition to furnish materials from other authors. Within this welter of particulars, an irreconcilable variety of facts and views are allowed to flourish. It is up to the reader to select and to judge, Zwinger affirms, not the compiler (Blair 2010, 193–202). A still more extreme case is Lorenz Beyerlinck's utterly derivative *Magnum theatrum vitae humanae* (1631), whose seven volumes are billed as sequels to Zwinger's *Theatrum* and whose alphabetical order, table of contents, diagrams, and indices vainly try to give some direction to the interpretation of its copious materials. In this respect, Renaissance

encyclopedia's erudite textuality was at odds with the Baconian and Cartesian desires to reform philosophical method by avoiding the lures of humanist philology and instead attending to things themselves (*res ipsa*). And while such philology was still crucial to the encyclopedia of Alsted and Kircher, in Leibniz' various encyclopedic schemas, language itself became an explicit philosophical challenge.

During the mid-sixteenth century, various thinkers began to fuse Lullian traditions in mnemotechnics and logic with Neoplatonic thought and, frequently, Ramist notions of arrangement to create another current of encyclopedia (Rossi 2000). Giulio Camillo, in *L'Idea del teatro* (1550), and Bruno, in *De lampade combinatoria Lulliana* (1587), invented new forms of Lullian mnemotechnics. For their part, the systematic encyclopedists Bartholomäus Keckermann, Clemens Timpler, and J. H. Alsted preempted the Cartesian call to start philosophy with a *tabula rasa* by relying on *praecognita* (general definitions and divisions), which they thought proper both to nature and philosophy. Leibniz, writing after Descartes, similarly insisted on these axiomatic truths in the schematic text, *Praecognita ad encyclopaediam sive scientiam universalem* (1678/79). Conversely, Alsted, Kircher, and Leibniz continued to assign Lullian combinatorics an essential role in the search for a *scientia universalis*.

In numerous encyclopedic works, but above all his *Encyclopedia, septem tomis distincta* (1630), Alsted borrowed from Platonism, Aristotelianism, Lullism, and Ramism, from Bernard de Lavineta, Zwinger, Jacopo Zabarella, Bruno, and Keckermann, to offer a systematic account of the *cursus philosophicus*. Treating encyclopedia as a pedagogical, ethical, philosophical, and, ultimately, religious undertaking, Alsted methodically reconfigures the *orbis disciplinarum*. In over a thousand chapters, his *Encyclopedia* defines, arranges, and explicates all the disciplines, including "mixed ones" (*farragines*). Adapting Keckermann's method of dividing each discipline into *praecognita*, *lexica*, *systemata*, and *gymnasia*, he reorganizes the encyclopedia so that it might transmit both the

latest learning and still be pedagogically useful. By systematically arranging the diverse material he draws from the commonplace tradition and then trying eclectically, if not syncretically, to harmonize its contradictory elements, Alsted, uniquely among his contemporaries, manages to complete his encyclopedic account of the disciplines and their interrelations (Hotson 2000, 2007). But in the event, in attempting to cram the latest, often conflicting, sources – especially from the physical and empirical sciences and the mechanical arts – into his theoretical frame, Alsted betrays the harmony promised by his theoretical claims and introductory tables. Like so many of his predecessors, he effectively sacrifices the clarity and simplicity he idealizes to strive instead after comprehensiveness. Here, as with various other exemplary instances of Renaissance encyclopedia, pedagogical and philosophical aims conflict. Still, throughout his career, Alsted never wavered from the belief that philosophy should be the chief discipline to establish encyclopedic order and secure the foundations of knowledge.

Kircher's many – several dozen by some counts – encyclopedic tomes cover topics including magnetism, geology, musicology, optics, numerology, Egyptology, and Sinology. His principal method, as detailed in *Ars magna sciendi sive combinatoria* (1669), is Lullian. The world, Kircher writes, is structured like the combinatory intellect, so that the study of one subject necessarily illuminates and is illuminated by all other subjects. Analogy and two species of combinatorics, *combinatio expansa* and *combinatio contracta*, serve as the chief engines of his attempts to achieve an all-encompassing *scientia* and *sapientia* (Leinkauf 1993, 32–33). More concretely, in *Oedipus Aegyptiacus* (1651–1654), combinatorics, informed by Kircher's antiquarianism, cabala, and other forms of *prisca sapientia*, yields an encyclopedia of all things Egyptian that aims, in the end, to decipher a single hieroglyph, which, not accidentally, is made to reconcile unity and multiplicity (Findlen 1996; Stolzenberg 2013).

Leibniz made encyclopedia a key element of his philosophical program. Influenced by Alsted (especially in his "Nova methodus discendae

docendaeque jurisprudentiae” of 1667, which is a mini-history of the encyclopedia culminating in Alsted) and Kircher (with whom he corresponded), Leibniz called for a new “scientific order.” More particularly, he defined the “encyclopedia” as the “system of all things . . . , of true and useful propositions that hitherto have been thought” (cited in Dierse 1977, 27). But rather than ever managing to undertake, let alone complete an encyclopedic project himself, Leibniz, beginning with *Dissertatio de arte combinatoria* (1666), sketched various meta-encyclopedias. These were based, at least initially, on the search for a “universal characteristic” (*characteristica universalis*), which would consistently, ideographically, and so truthfully represent mathematical, scientific, and metaphysical thought. Once secured, such characters were to be arranged by a unique encyclopedic “combinatory art,” a logical calculus, which looks explicitly back to Llull’s *ars magna*, but also anticipates Gottlob Frege’s and Charles Pierce’s work on logic in the late nineteenth century and, by his own account, Norbert Weiner’s idea of a computing machine. “The characteristic that I am proposing,” writes Leibniz, “requires only a new kind of Encyclopedia. The Encyclopedia is a body, where the most important human sciences (*connaissances*) are arranged in order” (cited in Dierse 1977, 32). But in “Nouveaux essais sur l’entendement humain,” Leibniz contemplates the Platonic-Stoic division of knowledge into logic, physics, and ethics, only to reject it as untenable. He proposes instead that every true proposition can be expressible, given the proper form and system of referential meaning, such that disciplinary divisions disappear. It is in this sense that his encyclopedia promised universal *mathesis*.

Besides the purely discursive book, Renaissance encyclopedism assumed many other material forms. Visual encyclopedism included the tabular or diagrammatic efforts of diverse thinkers such as Gesner, Alsted, Burton, Bacon, and Cesi. Drawing on Ramism, logic, and Vesalian empiricism, Johannes Jacob Wecker’s *Medicae syntaxes, medicinam universam ordine pulcherrimo complectentes* (1562) consists entirely of synoptic

tables that arrange and distill the medical knowledge of Hippocrates, Galen, and Avicenna for aspiring physicians. Robert Fludd’s *Utriusque cosmi, maioris scilicet et minoris, metaphysica, physica, atque technica historia* (1617, 1621) incorporates numerous tables and diagrammatic drawings to promote a comprehensive, syncretic, Hermetic science. With his *Orbis sensualium pictus* (1658), Comenius offers a pictorial encyclopedia for adolescents learning Latin. Meanwhile, encyclopedic emblem books by Andrea Alciato, Juan de Horozco y Covarrubias, Jacob Cats, Cesare Ripa, and many others instructed and delighted readers in moral and political philosophy, religious doctrine, and other topics. Cartography, such as Benedetto Bordone’s *Isolario* (1528) and Abraham Ortelius’ *Theatrum orbis terrarum* (1570), also had encyclopedic pretensions. More radically, Antonio Saliba’s *Nuova figura di tutte le cose che sono e del continuo se generano dentro la terra e sopra nell’aere* (1582) distills the known cosmos to a single broadsheet. Encyclopedic “sites of knowledge” also include libraries, academies, gardens, theaters, courts, pharmacies, and artisanal workshops (Findlen 1996, 97–154). Cabinets of curiosity (*Wunderkammer*) assembled by natural historians and *virtuosi* found discursive support in Samuel von Quiccheberg’s *Inscriptiones vel Tituli theatri amplissimi* (1565), the first early modern treatise on museology. Then there is Cassiano dal Pozzo’s “Paper Museum,” which combines antiquarian, art-historical, and natural-historical topics. Dal Pozzo, moreover, was instrumental in helping the Linceans publish their empirical, but also thoroughly humanist, *Rerum medicarum Novae Hispaniae thesaurus* (1651). This collaborative, encyclopedic account of Mexican flora, fauna, and antiquities was based on manuscripts by Francisco Hernández, who traveled to Mexico in the 1570s. Filled with numerous illustrations (but unfortunately not the originals done by native artists) and crowned by Cesi’s *Phytosophicae tabulae*, which aim to reconceive the *encyclopaedia* through a series of tables classifying botanical *res* and the many disciplines that can be used to know them, this hybrid text confirms the global pretensions of late Renaissance encyclopedism (Gabielli 1989; Hernández 2000). All the more

unfortunate, then, that Europeans had no inkling of how encyclopedism in China, in the form of the *leishu* (literally, “classified writings”) tradition, was reaching an apex in the same period.

Impact and Legacy

As Comenius, Kircher, Leibniz, and others pursued various Baroque forms of encyclopedism in the last half of the seventeenth century, another exorbitant strain emerged: polyhistory. Following and expanding on the precedents of Zwinger and Gesner, the polyhistor, with their unwieldy, often monstrous, compendia, earned mockery from many contemporaries for their unbridled pretensions. Yet while their *res publica litteraria* was often more imagined than real, among their number were some of the first intellectual historians to seek to convey the structure, content, relations, and history of all the humanist disciplines. Most notably, Daniel Georg Morhof, in his *Polyhistor; literarius, philosophicus et practicus* (1688), heroically labors, in the face of the “New Philosophy,” to resuscitate the moribund ideals of encyclopedic learning and Renaissance eloquence (Grafton 1985). Polyhistorical attempts at “universal history” also find significant parallels in Giambattista Vico’s *New Science* (1725, 1730, 1744).

Meanwhile, Pierre Bayle’s influential *Dictionnaire historique et critique* (1697) cultivates the new genre of the philosophical or critical dictionary. Employing an elaborate *mise-en-page*, Bayle juxtaposes differing opinions and source texts, while also deploying cross-references to enrich and complicate his alphabetical order. In this manner, he creates a skeptical, subjective, thoroughly dialogic form of encyclopedism that underscores what he takes to be errors in philosophy, history, literary criticism, and theology. Exemplary of this are the articles “Spinoza” and “Rorarius” – the latter disputes with Leibniz on the question of animal souls. In fact, Leibniz corresponded with Bayle and advised him in vain to trim down his annotations and focus on truths rather than errors. But as it stands, “the *Dictionary* is an encyclopedic anti-encyclopedia”

which charts the limits of knowledge and the folly of those who pretend to know with certainty (Selcer 2010, 76). More positively, Bayle espouses the principles of toleration, adumbrates a theodicy, and makes a strong case for fideism. Ironically, J. C. Gottsched’s German translation of the *Dictionnaire* (1740) begins by lauding Bayle as the scholar most deserving the title of *polyhistor*. Yet at the same time, German polyhistory was developing in another direction: J. J. Brücker’s *Historia critica philosophiae* (1742–1744), a cardinal text of philosophical eclecticism, aims to give the history of philosophy a scientific status and so remove the taint of doxography.

By the mid-eighteenth century, with the republic of letters thriving mainly in French rather than Latin (or German or English), *L’Encyclopédie, ou Dictionnaire raisonné des sciences, des arts et des métiers* (1751–65), edited by Denis Diderot and Jean le Rond d’Alembert, adopted an alphabetical order for its 17 volumes (later supplemented by 11 volumes of plates) to achieve a “better linking” of words to things. More to the point, in urging the amending and cultivation of all fields of knowledge, Diderot and d’Alembert enthusiastically proclaim their debts to Bacon (“[c]e génie extraordinaire”). As d’Alembert writes, given the infinite number of particulars, the endless possible perspectives on these particulars, and humanity’s inability ever to achieve a divine perspective, they have pragmatically opted for making “man” and the Baconian division and classification of the human sciences into history (memory), philosophy (reason), and poetry and the other productive arts (imagination) into their organizing principle. This *Tree of the Human Sciences* is, with various modifications, shown in the diagram, “Système figuré,” and then further glossed in another paratext. Likewise, the *Prospectus* for the entire *Encyclopédie* begins by asserting that those who doubt such a project should recall Bacon’s claim in *De augmentis scientiarum* (1623), where the “impossibility” of such a work is rejected, provided that it is undertaken by many capable men and that it is “done in the succession of ages, though not in one man’s life” (Diderot and d’Alembert 2016). Further, in contrast to Bayle, Diderot, in his article

“Encyclopédie,” urges a positive form of encyclopedism. For the sciences, he insists, have already made enormous advances, as has language. Stressing the need for an order that is “clear and easy” rather than “a torturous labyrinth,” Diderot reiterates the utility of Bacon’s division of the sciences, even as he outlines five other ways the material of the *Encyclopédie* is ordered; the fifth way being a network of cross-references (*renvois*), which he provocatively calls the “most important part of encyclopedic order.”

In sum, Renaissance encyclopedism can be understood as a nascent form of intellectual history and, in many instances, of the history of philosophy. Given, then, the differences between “internalist” and “externalist” accounts of intellectual history (a distinction implicitly made by Leibniz and explicitly in recent times by scholars such as Thomas Kuhn and Donald Kelley), externalist approaches more profitably explicate early modern encyclopedic thought and its contingent representations of the nature of and relations between the various disciplines. In other words, what matters in Renaissance encyclopedism is not only what is written, but also how, why, where, and when it is written. For the “larger context” in which to understand the history of intellectual history is the “history of literature – literature in the traditional sense of the total accumulation of humanity’s written remains. This was the view taken by scholars like Alsted, Morhof, and [G. J.] Vossius, for whom philosophy itself, especially in the age of print culture, was in the first instance a form of literature” (Kelley 2002, 6). But already Bacon, in *Advancement of Learning* (1605), calls for a *historia literarum* that would help distinguish between truth and falsity. In other words, the history of most disciplines, like Renaissance encyclopedism itself, operates in the gray area of opinion, in between certainty and doubt. Leibniz’ various, ambitious, but ultimately unrealizable schemas to put the “encyclopaedia” on a firmer, more metaphysical foundation rests on his imperfect efforts to excise historical and linguistic contingencies. In the same vein, Hegel’s “philosophical encyclopedia” – as embodied by his *Encyclopedia of the Philosophical Sciences in Basic Outline* (1817) –

seeks to distinguish itself from inferior, positivist, that is, contingent disciplines like philology or even from a contextualist history of philosophy. But by following exclusively the logic of Absolute Spirit, such an encyclopedia ignores or sublates the very differences that enable the variety and subtlety of Renaissance encyclopedic thought. Conversely, recent direct descendants of Renaissance encyclopedism include *Historisches Wörterbuch der Philosophie* (1971–2007), *Dictionary of the History of Ideas* (1973–1974), the online *Stanford Encyclopedia of Philosophy*, and *Daphnet (Digital Archives of Philosophical Texts on the NET)*. Lastly, there is this *Encyclopedia of Renaissance Philosophy* in which this entry plays a small, if synechdochic, part.

Epicureanism

Ada Palmer
Department of History, University of Chicago,
Chicago, IL, USA

Abstract

Epicureanism posed a unique challenge to dominant belief systems in the Renaissance, because of its attacks on Providence, divine action, planned creation, prayer, and the immortality of the soul, its atomist physics and self-sufficient materialist model of nature, its account of natural selection, its developmental account of the origin of society and government, and its focus on pleasure-seeking as a moral good. After being known in the

Middle Ages mainly through attacks by early Christian apologists, knowledge of Epicureanism expanded thanks to humanist interest in reconstructing the classical world and the recovery of texts. Epicurean content in Cicero's philosophical dialogs was followed by the recovery of Lucretius (1417) and Diogenes Laertius (translated into Latin 1433). In addition to figures who treated Epicureanism extensively, such as Lorenzo Valla, Girolamo Fracastoro, Giordano Bruno, and Pierre Gassendi, Epicurean influence can be seen in the works of figures including Niccolò Machiavelli, Marcello Adriani, Michele Marullo, Bartolomeo Scala, Michel de Montaigne, Edmund Spenser, Henry More, Marin Mersenne, Margaret Cavendish, Isaac Newton, Thomas Hobbes, John Locke, and others. At the same time, heterodox Epicurean doctrines continued to be stigmatized and associated with atheism, hedonist sensualism, sodomy, and general irreligion, so Epicureanism appears as an object of fear and a term of abuse in general accounts of atheism and heresy, especially Reformation and Counter-Reformation literature, and in specific attacks on radical figures, from Luther and Erasmus to Spinoza. Epicureanism's recovery has received particular attention from modern scholars because of the powerful similarities between its core doctrines and characteristically modern secularized science, ethics, and political theory.

Introduction

All the ancient philosophical schools revived by the classicizing efforts of Renaissance humanists contained some elements which combined easily with the religious, scientific and moral doctrines inherited from the late medieval world, and other

elements which challenged them. Epicureanism fell on the most radical and controversial end of this spectrum at every stage of its recovery. This was due in part to the deeply heterodox and secularizing potential of its core doctrines, and in part to the paranoia and stigma attached to Epicureanism by early modern stereotypes about the effects of certain radical beliefs. Epicureanism's core doctrines are closely interlinked, but can be roughly subdivided by their arenas of influence: science, theology, moral philosophy, and political thought.

Heritage: Pre-Renaissance Knowledge of Epicureanism

Between the ninth century and 1417, when no Epicurean authors circulated, Epicureanism was known primarily through a mixture of passing references in classical works and fierce attacks by early Christians. This produced a contradictory as well as fragmentary portrait of the school. Seneca, Cicero, and other ancient thinkers spoke of Epicureanism with some respect, acknowledging it as a peer of the Stoics and Platonists. Seneca specifies that the Epicureans believe pleasure (*voluptas*) is the highest good, and describes the Epicurean ideal life: enjoying a modest, healthy meal in the tranquility of a garden while discussing philosophy with friends (*Epist.* II. xx.10). Fragmentary Epicurean voices, mostly Lucretius, were preserved in single-sentence chunks by grammarians, who did not comment on anything but the language of the *De rerum natura*, but still lent Lucretius status by presenting him as a peer of Virgil, Ovid, Empedocles, Varro, and other valuable authorities. In contrast, Christian apologists including Arnobius, Lactantius, Jerome, Ambrose, and Isidore of Seville presented Epicureanism as a wicked rival to be crushed and an exemplar of the folly of paganism. Lactantius describes Epicurean doctrine in more detail than Seneca or even Cicero, but he claims that Epicurus' aim was to reassure the wicked that they could carry on safely in their sins, by telling the irreligious that the gods are indifferent to their impiety, telling the ungenerous that they share no bond with fellow humans beyond base matter, and

telling all sinners that they need have no fear of posthumous punishment (*Divinae Institutiones* III.17). These apologists usually presented the Epicurean thesis that pleasure is the highest good as advocating sensual pleasure, thus licentiousness, sodomy, and gluttony, a stigma it carries to this day. Such works predisposed late medieval scholars to see Epicureanism as a particularly wicked enemy, and, while Dante placed other classical philosophers with the virtuous in Limbo, he reserved a special punishment in hell for "Epicurus and his followers" who deny the afterlife. Yet, as Petrarch and his successors gave greater weight to Seneca and Cicero, these contradictory accounts of Epicurus became a point of confusion and curiosity.

Heritage: Renaissance Recovery of Sources

Knowledge of Epicureanism expanded first in the fourteenth century, when Petrarch and his peers read with renewed interest the dialogues of Cicero which had already been available in the later Middle Ages: *De finibus*, *Tusculanae disputationes*, *De natura deorum*, *De officiis*, as well as *De divinatione*, *De fato*, *De senectute*, *De amicitia*, *Paradoxa* and the *Topica*. These focused on moral philosophy and Epicureanism's rivalry with the Stoics, whom Cicero preferred, so their presentation of Epicurean material is highly selective. Petrarch recommended Cicero along with Seneca as the central textbooks of humanist moral education, and Cicero's dialogues were printed as early as 1456 (Hankins and Palmer 2008). Cicero was interested primarily in moral philosophy, as were many of his humanist readers, making ethics the first arena in which Epicureanism made a visible impact.

The full text of the *De rerum natura* first returned to circulation thanks to Poggio Bracciolini, who brought his transcription of an unknown manuscript back from the Council of Constance to Florence in 1417, where it entered the library of Niccolò Niccoli. Centers of early interest in Lucretius have been identified in Florence (Brown 2010b), Rome (Palmer 2014a),

Naples (Goddard 1991), and Spain (Vera 2009), and manuscripts were owned and used by prominent figures including Pietro Vettori, Giovanni Sulpizio Verolano, Pomponio Leto, Antonius Panormita, and Bonifacius Amerbach. The poem provided much more detail than was previously available, particularly about natural philosophy, but its structure is unsystematic and its poetic language difficult, more so given the poor condition of the earlier manuscripts, making it far from a straightforward overview of the school and its doctrines. Yet, the poetic form was a powerful asset to the work's circulation, since it appealed to scholars of poetry and literature even if they had no particular interest in the poem's radical content, especially once it became clear that Virgil had borrowed lines from the *De rerum natura*. Printed 30 times from 1473 to 1600, the *De rerum natura* became a focus of controversy over whether it was safe to teach classics for their literary value even if their content was potentially heretical. Starting in the later sixteenth century, the poem sparked philosophical rebuttals. These included the apologetic but critical 1563 commentary published by Lucretius' foremost editor, the Parisian Aristotelian Denys Lambin, Girolamo Fracchetta's 1589 *Breve spositione di tutta l'opera di Lucretio*, Lucy Hutchinson's late seventeenth-century project to translate the epic into English for the express purpose of understanding and rejecting it, and the 1745 Latin verse epic *Anti-Lucretius* by Cardinal Melchior de Polignac.

The only surviving writings of Epicurus himself are letters and a collection of maxims included in the life of Epicurus by Diogenes Laertius (*Lives of the Philosophers*, Book X). These offer a far more direct introduction to the Epicurean system than the more ubiquitous Latin sources. Some content from Diogenes Laertius' lives was known in the high Middle Ages thanks to a twelfth-century translation into Latin by Henricus Aristippus, which did not circulate but became the basis of the popular compendium *On the Lives and Mores of the Philosophers* once attributed to Walter Burley, which was printed as early as 1470. A full Latin translation by Ambrogio Traversari was completed in 1433 and saw considerable

manuscript circulation before its first edition c. 1472, while the Greek of Book X was not printed until 1533 (Hankins and Palmer 2008).

Innovative Impact: Science and Natural Philosophy

Epicureanism's scientific core is atomism, a theory pioneered by Democritus, which posits that matter is composed of vacuum and of atoms, which are the smallest unit of matter, indivisible, variable in shape and size, and infinite in quantity but finite in type, much like the elements of the modern periodic table. While Epicurean atoms are too small to be perceived directly, their shapes and motions generate color, sound, and all sense perception – smoothness generating sweetness, roughness bitterness, etc. – and their finite variety means that their finite possible combinations form the recurring patterns visible in nature. By explaining natural phenomena, such as weather, planetary movements, tides, and magnets, using the natural properties of atoms, Epicureanism became the first account of nature which did not depend on divine participation, radically different both from pagan accounts of Neptune and Aurora and from such Christian models as angelic movement of spheres or Dante's belief that gravity reflected the tendency of base things to fall downward toward Satan.

Epicurean atomism had few direct followers in the Renaissance. Girolamo Fracastoro (c. 1476–1553) taught at the University of Padua and is best known as a physician. His work on syphilis, typhus, and other sicknesses pioneered the contagion theory of disease, and he argued that fossils are remains of ancient creatures now extinct, building upon the Epicurean argument made by Lucretius that in early times the Earth produced many bizarre species, but only those suited to their environments survived to the present day (Lucretius V 837–877; Goddard 2003). In addition to his overt appeals to atomic theory, Fracastoro's debt to Epicureanism is clear in his general rejection of hidden and immaterial causes, and in his decision to follow Lucretius in writing his scientific work

Syphilis sive morbus gallicus as an epic poem (Maurette 2014). Giordano Bruno (1548–1600) was burned at the stake for heretical opinions including rejection of several Catholic doctrines traditionally tied to Aristotelian models, and his Epicurean-influenced views on astronomy, including belief in multiple earthlike worlds. Pierre Gassendi (1592–1655) was a self-proclaimed “Christian Epicurean” and used Epicureanism and classical skepticism to attack Aristotle (Lolordo 2007). Gassendi focused on the Epicurean atomic model of cognition, which states that we can have no direct empirical knowledge of material things, only of the perceptions of things which our sense organs receive from shells of atoms cast off by objects, arguing from it that we can never have true knowledge of things themselves, against Aristotelian claims to offer real knowledge of forms and categories. Gassendi’s project demonstrates how the unique form of “constructive skepticism” or “weak empiricism” used in Epicurean denial of direct knowledge of the atomic substructure of nature contributed to the foundation of the modern scientific method, especially through his friend Marin Mersenne and his association with René Descartes, Galileo Galilei, Tommaso Campanella, Margaret Cavendish, Thomas Hobbes, and others (Popkin 2003; Palmer 2014; Wilson 2008), as well as how late Renaissance thinkers strove to harvest what they saw as the most desirable aspects of Epicureanism and combine them with more orthodox religion. In addition to these overt atomists, many more figures expressed interest in atomism as an example proving that it was possible to develop a model accounting for the operations of nature without divine participation. Its influence can thus be felt as far as the systems of Henry More, Newton, Locke, and Enlightenment clockmaker Deism (Wilson 2008).

Innovative Impact: Theology

Epicureanism is even more radical than Deism in its denial of an afterlife and its rejection of any

Providence or design in nature or history, attributing even creation to chaotic natural forces: the Earth and other worlds formed when atoms floating in the void collided and clumped together by chance thanks to a random “swerve” which randomized their movement. While Epicurus denied the immaterial and the possibility of Heaven or Hades, he did not deny the existence of gods directly. His model of cognition posits that thoughts are formed from atomic impressions received from real objects, so, just as a chimera is a jumble of atomic impressions generated by lion, goat, and snake, so human ideas of Zeus and Venus must derive in part from an atomic impression from some real blissful and eternal being – an argument not unlike Descartes’ thesis that the concept of God can only derive from an infinite source, i.e. God. However, Epicurus claimed that, in order to be happy and eternally unchanging, gods must logically be distant and insensible, free from the stresses of heeding prayers and ordering nature.

This system is technically theist but functionally atheist, in that removing these gods from the system would have no impact except for requiring a new cognitive model, which, by the Renaissance, Ockham and nominalism had already supplied. Consequently, the reception of Epicureanism is inextricably linked to the history of atheism, both because Epicurus and those who studied him were frequently accused of atheism throughout the early modern period, and because modern scholars of early atheism can learn much from Renaissance reactions to and transformations of the first robustly developed philosophy which did not require the divine.

The *De rerum natura* in particular is filled with attacks on veneration of the pagan gods, which can be read as anti-theist, but in the Renaissance they were more often read as anti-pagan attacks on superstition, to which the true faith was presumed to be immune. These were appropriated in their anti-pagan and anti-superstition spirit by fifteenth- and sixteenth-century humanists, for example, by the Florentine literary teacher Marcello Adriani (1464–1521), who used them against Girolamo Savonarola (Brown 2010b), and later by such critics of dogmatic Christianity as Montaigne and Voltaire (Screech 1998).

Denial of Providence and of the afterlife was more directly problematic. The immensely influential Florentine Neoplatonist Marsilio Ficino (1433–1499) later burned in horror a work on Lucretius he wrote in his youth, and devoted large sections of his *Platonic Theology* to rebutting Lucretius' attacks on the immortality of the soul (Hankins 2013). It was a commonplace of Renaissance psychological theory that only fear of God and Hell restrained people from wild criminality, to the degree that wantonness, sodomy, and public lewdness were in themselves sometimes sufficient to invite prosecution for atheism even without any profession of heretical belief. Political theorists from Thomas More to Thomas Paine considered some basic theism mandatory for a good citizen, and Pierre Bayle was accused of atheism himself for saying in his *Philosophical Dictionary* (1697) that it was possible for an atheist (he names Epicurus and Spinoza as examples) to be a moral person. Reformation and Counter-Reformation literature frequently employs Epicureanism as a term of abuse, sometimes using it as a label for denial of Providence, but more often equating it generically with whatever position the author wishes to condemn.

Innovative Impact: Ethics and Political Thought

Just as Epicureanism supplied the first model of self-sufficient nature, so too it supplied the first ethical system which had no concern for the divine. Epicurus' goal in promoting atomism was eudaemonist, to facilitate happiness by freeing people from fear of wrathful gods and posthumous punishment, which he saw as a substantial source of human suffering. Since the soul was destroyed at death, long-term consequences were meaningless, and no external set of divine laws regulated right and wrong. With pleasure as the ultimate good, all actions could be judged good or bad based solely on the effect they were likely to have on the happiness of the subject during his or her lifetime. Epicurus defined happiness negatively as the absence of pain. Thus, he recommended, not positive pleasures such as

delicious food or sexual pleasure, but tactics designed to avoid long-term pain, such as a healthy diet, moderate sexual activity sufficient to satisfy appetites, and avoiding the stressful arenas of politics, glory seeking, and romantic love. The positive experiences prescribed to the Epicurean are those likely to be stable and long term, such as friendship, contemplation, literature, and a retired life in a beautiful garden.

One of the most innovative steps in moral philosophy stimulated by Epicureanism was made before any Epicurean texts had returned, when scholars knew almost nothing about Epicurean ethics apart from the core doctrine, repeated by Seneca and Lactantius, that according to Epicurus pleasure was the highest good. With little more than this and a little Cicero at his disposal, the pugnacious philologist Lorenzo Valla (c. 1407–1457), best known for disproving the authenticity of the Donation of Constantine, wrote *De voluptate* (also called *De summo bono*), which presents a dialog focused on Stoic and Epicurean interlocutors based on Cicero's Philosophical works. Valla's supposed Epicurean outlines a philosophy of pleasure focused on positive pleasures, and boasts of the many delights nature has designed for human enjoyment, fundamentally contradicting Epicurean attacks on Providence, intelligent design, and the centrality of humanity in the cosmos, which, lacking Lucretius, Valla did not yet have access to. Valla's vivid and wholly novel "Epicurean" ethics typifies the tendency of humanists to disguise their original creations by framing them as reconstructions of ancient systems, a self-presentation which increased their desirability and authority in the Renaissance, but has largely prevented humanist innovations from being studied or even recognized by scholars in the post-Descartes world which favors innovators and system builders (Kessler 1988; Nauta 2009).

The Epicurean developmental account of the origin of society, religion, and government was outlined in Lucretius Book V. It combined with Epicurean ethics to exert an enormous impact on radical political thought. Lucretius describes how early humans lived simply, gathering the fruits of nature and sleeping beneath the trees, without

language, law, or religious practices, but gradually gathered in groups to build cities, develop governments, and acquire luxuries which eventually led to corruption and the necessity of law. Much like Aristotle's *Politics* and other classical images of the four Ages of Man, this passage offered a strong alternative to the orthodox model of law descending from Adam and Noah, and kings and governments as agents of divine will acting out the script of Providence. This naturalist account of the origin of society excited considerable attention in late fifteenth-century Italy, fired by attempts to understand travelers' accounts of unknown cultures from the New World and elsewhere.

Machiavelli transcribed the entire *De rerum natura* himself (BAV Ross. Lat. 884) and was part of a concentration of Epicurean activity in Florence, including his colleagues Marcello Adriani and Donato Giannotti, and the broader Florentine intellectual atmosphere shaped by figures including Ficino, the Greek émigré Michele Marullo, Bartolomeo Scala, and Leon Battista Alberti, who had close ties to Machiavelli's family (Brown 2010a). Machiavelli's innovative approach to depicting the human origins and natural evolution of governments certainly resembles Lucretian primitivism, as do his radical historical and utilitarian evaluations of Roman and Christian religion. Machiavelli's annotations in his personal copy of Lucretius demonstrate an unusually keen interest in the technical details of atomic theory, especially the swerve as the origin of free will (Palmer 2014). Arguments that Machiavelli himself was an atomist rely only on indirect evidence (Rahe 2007), but undeniably his pioneering utilitarian ethics divorces human ethical questions from divine concerns. Thus, Epicurean ethics was not Machiavelli's starting point, but it provided ammunition for his argument that – contrary to the common consensus – it is possible to design a functional ethical system isolated from divine concerns. Thus Machiavelli isolated Epicurean secularized ethics from the rest of Epicureanism and reused it for his own purposes, much as Gassendi and his associate Mersenne extracted and reused Epicurean empiricism, and as Isaac Newton and John Locke later extracted and reused the Epicurean practice of evaluating natural phenomena in

isolation from the divine. Both directly and through Machiavelli and others, Lucretian primitivist accounts of the evolution of society and government then exerted substantial influence on Thomas Hobbes and Jean-Jacques Rousseau.

Epideictic in the Renaissance

Véronique Montagne

CNRS, BCL, UMR 7320, 98 Bd Edouard Herriot,
Université Nice Sophia Antipolis, Nice, France

Abstract

The epideictic (derived from the Greek term) or demonstrative (Latin origin) genre is one of the three rhetorical genres – together with the judicial and deliberative – which form part of the cultural heritage passed down by scholars of the Middle Ages and Renaissance. The judicial speech is used to accuse or defend somebody, the deliberative to recommend or warn against something, and the epideictic to praise or blame someone. While the counsel evokes the future (deliberative speech) and the judge the past (judicial), the author of an epideictic text focuses instead on the present but can also take into account the past and future (Aristote, *Rhétorique*, Le Livre de poche, Paris, 1991, p. 94). The concepts discussed are varied: as part of a panegyric or eulogy, one can praise the gods, men, places, and many other subjects (Cicero, *De oratore*, Les Belles-Lettres, Paris, 1869; *Topiques*, Les Belles-Lettres, 1990; *L'orateur*, Les Belles-Lettres, 2002; Quintilian, *Institution oratoire*, Panckoucke, Paris, 1839 III, 7, p.113).

Synonyms

[Demonstrative](#)

Inherited Definitions

In literature, many portraits fall into the epideictic genre, which, in such cases, can be referred to as the “(epideictic) register.” It reflects a fundamental affect or attitude to the world and forms the basis of a wide variety of discourses (Bonhomme 2008). Blason poetry is a classic example, as is encomiastic poetry. Quintilian helped draw the

link between the epideictic register and what would centuries later be called “literature”; this association was inspired by the texts of Theophrastus and supported by the fact that the demonstrative genre essentially seems to have an aesthetic and/or recreational purpose.

Epideixis may, however, retain its argumentative scope (Quintilian 1839 III, 7, p. 99). This type of discourse, a priori better suited for show than action, still has an argumentative interest even if no thesis is proclaimed, “because it reinforces an inclination towards action by increasing adherence to the values it praises.” It therefore “increases the intensity of adherence to certain values” (Perelman et al. 2008, p. 66–67). Although it is part of a broad chronology, the pragmatic scope of *epideixis* should be considered, as this communion of values can/must lead to actions or consequential modification of behaviors.

When it comes to praising or blaming an individual, the notions addressed relate to a specific *topos*, in this case the location or argument of the person. Time is mentioned (the period preceding that person, the one during which they lived, or, when applicable, the events following their death), as well as their country, parents, ancestors, children, qualities of their soul, or external circumstances related to their body (Quintilian 1839, III, 7, p. 101 *et seq.*). Above all, the audience’s preferences must be taken into account (Quintilian 1839 III, 7, p. 111).

Finally, the epideictic genre/register is based on different figures of *elocutio*, such as the macrostructural figure of amplification, with its microstructural variations, which include hyperbole, enumeration, and any figure of syntax that heightens the sentence. It may also include metaphors or comparisons (gratifying or demeaning) and is characterized by a subjective lexicon that can be evaluative, ameliorative, or pejorative, depending on the intentions of the speaker assessor using it (Molinié 1992; Reboul 1984).

Epidemics

► Contagion, Renaissance Idea of

Epigram

Maia Wellington Gahtan
 Florence Campus, Kent State University,
 Florence, Italy

Abstract

The concise and witty genre of the classical epigram enjoyed a significant revival among Renaissance humanists, serving as an important component of school curricula, social exchange, and political and cultural commentary.

Literary and Social Contexts

At the end of his *Lives of the Philosophers*, Diogenes includes one or more epitaphs for the philosopher whose life and career is the subject of that book. Drawing on the tradition of funerary inscriptions and inscriptions used as *tituli* for statues, Diogenes created a precedent that would be widely imitated during the Renaissance by the

likes of Paolo Giovio and Giorgio Vasari, each of whom included epitaphs at the end of their biographies – epitaphs incised on tombstones but also those written by colleagues in literary commemoration of the deceased. The epitaphs' incorporation into these texts betrays not only the importance of ancient models for these Renaissance writers but also the supreme social value of this genre of occasional poetry. Including them in the biographies of important statesmen, writers, and artists identifies such individuals as members of an intricate social web while at the same time raising their social status. Often it is not clear from the text whether the epitaph was inscribed or literary, especially as literary epitaphs were often written on slips of paper and attached to tombs in order to honor the deceased.

Most Renaissance epigrams, including funerary epitaphs, were written as a form of social exchange between friends and colleagues, but they were also popular at court and in learned societies. Epigrams, along with the personal letter, eventually came to characterize Renaissance humanism as these two genres were dramatically revived beginning in the fourteenth century, after having been dormant in the West since Late Antiquity. Characterized by their brevity (consisting in elegiac couplets of usually two to six lines), pointed focus, philological sophistication, wordplay, and double entendre, epigrams addressed a wide range of topics, belonging above all to intimate contexts and dinner parties. They also served as the object of contests and provided political commentary as in the famous case of the ancient Roman statue dubbed “Pasquino” in Rome which received numerous anonymous epigrams criticizing, above all, the papacy and representatives of government in the early sixteenth century.

While some epigrams were encomiastic in function, many others were ironic, critical, ephrastic, polemic, erotic, or even insulting, following such ancient models as were preserved in the *Planudian Anthology* (first published in the original Greek language by Janus Lascaris in 1494) and in the epigrams of Martial, Catullus, and Ausonius. These ancient Greek and Roman poets offered stylistic models but also subject

matter for their Renaissance followers so that epigrams were written about ancient heroes or even lost works of art such as the sculptor Myron's famous bronze statue of a cow which had once graced the Athenian Acropolis but then was taken to Rome sometime after the late Republic and then eventually to Constantinople. While the ancient authors might have seen the statue, their Renaissance imitators surely did not so that their epigrammatic epigrams amounted to a purely literary exercise.

As humanist schooling became ever more prominent over the course of the fifteenth century, the epigram rose in popularity since its short format and simple basic rules made it the genre of choice for the teaching of Latin poetic writing. Since school epigrams tended to be about everyday subjects and surroundings, including classmates' appearance and foibles, it is not surprising that these same individuals would continue to write them in social contexts at university and after their schooling was completed.

Beginning with Andrea Alciati's first edition of his *Emblematum liber* (1531), itself heavily based on the *Planudian Anthology*, epigrams took a new more public turn. Immensely popular, this collection of epigrams with interpretive commentary was soon illustrated with highly abstracted images making for complex image-poem relationships that could generate endless interpretations – and thus the quintessential Renaissance and Baroque genre of the emblem book was born.

The production and eventual collection of epigrams into Renaissance anthologies, including emblem books, precede their theoretical analysis in poetical treatises which takes place only in the later sixteenth and seventeenth centuries, after epigrams no longer fulfilled the same intimate social functions and also began to be written in the vernacular languages.

Epistemology, Artisanal

Pamela H. Smith
Department of History, Columbia University,
New York, NY, USA

Abstract

Craft is often viewed as “knowledge how” and science as “knowledge why,” but the term

“artisanal epistemology” challenges this dichotomy to recognize that the ability of craftspeople to produce material things rests upon experientially derived bodies of knowledge that can be employed rigorously and methodically to extend, categorize, innovate, and accumulate new knowledge. This view, in emphasizing the bodily labor of the crafts-person as the source of knowledge about the world, constitutes a corrective to a long philosophical tradition that views “mind” and consciousness as the primary source of knowledge. The idea that artisans possess a mode of gaining and conceptualizing their knowledge that can be named an epistemology is a recent innovation of the historiography of early modern science; however, several different twentieth-century currents in history and the social sciences led up to the formulation of this term. “Artisanal epistemology” has been used by historians of science since the 2000s in studies that foreground the contribution of artisans and practitioners to the Scientific Revolution.

Innovative and Original Aspects

The idea that artisans possess a mode of gaining knowledge that can be called an epistemology is a recent innovation of the historiography of early modern science. Craft is often viewed as “knowledge how,” while science is seen as “knowledge why,” but the term “artisanal epistemology” challenges this facile dichotomy to recognize that the ability of craftspeople to produce material things rests upon experientially derived bodies of knowledge that can be employed rigorously and methodically to extend, categorize, innovate, and accumulate new knowledge about nature. This view, in emphasizing the bodily labor of the crafts-person as the source of knowledge about the world, constitutes a corrective to a long philosophical tradition that views “mind” and consciousness as the primary source of all knowledge. Moreover, this term works to erase the long-standing division between “mind” and “hand” that has informed philosophical analysis

and helped foster social stratification for millennia.

Although the term itself is new, it rests upon a wide swath of important developments in twentieth-century philosophy, history, and the social sciences. The development of phenomenology by Edmund Husserl (1859–1938) emphasized the primacy of human sensory perception in knowing the world. His followers, especially Martin Heidegger (1889–1976) and Maurice Merleau-Ponty (1908–1961), developed a focus on the body and the lived world of everyday activity as the primary site of knowledge formation. As they saw it, as human beings interacted with their environment, and as they apprehended the world through their senses, they enter into relationships with things, through which meaning is made. The human body, then, is the source of human intention and of meaning-making in the world. From this perspective, the making practices of the productive crafts constitute a prime realm from which human knowledge and culture emerge. Phenomenology has had recent interpreters, for example, the anthropologist Tim Ingold, who regards the development of useful skills of manipulating natural materials as characteristic of both nonhuman and human animals, with the interaction between bodies and environments bringing about the emergence and growth of skills and knowledge (Ingold 2000; Marchand 2010). This view has explicit implications for science and craft, and Ingold’s work has inspired research on crafts and craftspeople in a variety of disciplines.

Similarly foundational developments from the realm of the nascent discipline of the history of science occurred in the 1920s and 1930s when a handful of philosophers, impelled by Marxist historical materialism and the logical and empirical positivism of members of the Vienna Circle, produced germinal works on the history and philosophy of science that gave a role to artisans in the formation of scientific knowledge. These scholars were concerned with the period that later became known in the history of science as “the Scientific Revolution” – a series of shifts in worldview from about 1450 to about 1750 that were viewed as the first steps toward the system of knowledge and

knowledge production about nature called “modern science.” These scholars did not form a unified research program or school, but rather opposed from several different realms of scholarship and activism the prevailing idealist philosophy, instead viewing all knowledge and intellectual change as arising from experience, rather than from ideas. Most influential of this group was the physicist and philosopher, Edgar Zilsel (1891–1944), whose work on the concept of “genius” (and on associated concepts such as “inventor” and “artist”) in the Renaissance sought to show the ways in which social forces, including the decline of feudalism and the rise of capitalism, gave rise to and mediated developments in human consciousness. Zilsel’s essays, “Problems of Empiricism” (Zilsel 1941b) and “The Sociological Roots of Science” (Zilsel 1942), outlined his general view that the emergence of the new sciences of the seventeenth century was a sociological process, rooted in the transition from feudalism to early capitalism. During this period, as towns grew and new technologies of shipping, mining, and gunpowder warfare emerged, a new group of “superior artisans,” such as those who began to call themselves architect-engineers, as well as scientific instrument makers and others who used practical mathematics, such as surveyors and navigators, brought about a new experimental approach and a new idea of progress that informed and was absorbed by those who began to call themselves “new philosophers” and “experimental philosophers” from the early seventeenth century (Raven et al. 2003). Two decades later, Paolo Rossi built upon Zilsel’s work in important ways, arguing that artists and practitioners in the early modern period formulated the values that informed modern science, among them the progressive and cumulative nature of scientific knowledge, the view that technology is perfectible, and the idea that scientific knowledge consists in knowing how a mechanism works or is made, rather than knowing the causes, as Aristotle and the scholastics had taught (Rossi 1957, 1962).

At the same time, other philosophers, also influenced by Marxism but starting from a different perspective than Zilsel, argued that the rise of machines and new technologies of capitalist

production gave rise to a “modern” mechanistic picture of the world. Of these, the Russian physicist Boris Hessen (1893–1936) was perhaps best known in the Anglophonic world for his 1931 paper, “The Social and Economic Roots of Newton’s *Principia*,” which laid out his view that the rise of the new science of Galileo and Newton was a by-product of capitalist modes of production and their technologies. Newton’s mechanics, for example, arose out of the new types of machines used in warfare, mining, shipping, and other areas of merchant capitalism of the seventeenth century (Hessen 1931). Scholars associated with what became known as the Frankfurt School, such as Franz Borkenau (1900–1957) who published *The Sociology of the Mechanistic World Picture* in 1932, developed similar views about the social origins of scientific change, especially in his assessment of the centrality of practices and practitioners of technical fields in the rise of mechanical views of the cosmos.

Research and publications emerging from completely different realms of scholarship also contributed to the view that practice formed the basis of the new science. For example, the literary scholar Leonardo Olschki (1885–1961) made known the contents of many practical writings of the sixteenth and seventeenth centuries, which he viewed as influencing the new scientist, Galileo Galilei (Olschki 1927). In a similar vein, but based on a different body of practical writings, American historian Lynn Thorndike (1882–1965) argued in *A History of Magic and Experimental Science* (eight vols., 1923–1958) that the roots of experimental science lay in the operative worldview and practical actions of practitioners of magic, as expressed in books of magic, eventually collecting together eight volumes of writings on practical magic (Thorndike 1923–1958). He claimed that “magicians were perhaps the first to experiment; and that the history of both magic and experimental science can be better understood by studying them together” (Thorndike 1923, I.2). At roughly the same time, but from the direction of sociology, American sociologist Robert Merton (1910–2003), in his 1938 publication, *Science, Technology, and Society in Seventeenth-Century England*, argued that the development of new

technologies especially associated with the rise of commerce in seventeenth-century England was crucial to the development of empiricism (Merton 1938). Merton's work was taken up by sociologists of knowledge and eventually in the 1980s by historians of science.

Before the 1980s, many Anglophonic historians of science, influenced especially by the work of Alexandre Koyré (1892–1964), A. R. Hall (1920–2009), and Thomas Kuhn (1922–1976), rejected the approach of Zilsel and even of Merton, denying any importance to practice and practitioners in the making of scientific knowledge (Koyré 1968; Hall 1959; Kuhn 1977). The situation in France, however, was quite different, where French social history, especially that practiced by the so-called *Annales* school, whose members examined in extensive detail the historical conditions of life in preindustrial French villages and towns, brought to the fore historical documents and writings of agricultural laborers, craftspeople, and other practitioners (Febvre 1935; Long 2005). An agronomist, François Sigaut (1940–2012), whose professional activities took him throughout France and French Africa, formulated an approach to the history of technology that focused on bodily “gestes” and techniques in preindustrial European and African agricultural practices (Sigaut 1994). His work was influential in the human sciences and history of science in France in the 1990s and 2000s (Bouillon et al. 2017; Cardinal et al. 2016). Also growing out of French social history was the turn to cultural history and microhistory by historians such as Natalie Zemon Davis, Carlo Ginzburg, and James Amelang that brought to light the lives and worldviews (*mentalité*) of non-elites, including craftspeople (Davis 1975; Ginzburg 1992; Amelang 1998). From the direction of a new social history of art, especially in the work of Michael Baxandall (1933–2008), the “cognitive style” and “period eye” of Renaissance artists also began to be explored, which emphasized the cognitive and intellectualizing dimensions of artistic work (Baxandall 1972, 1980; Alpers 1983). Theorists of modern craft concerned to articulate the role of design in craft and art have also been influential in explicating the union of

hand and mind involved in making (Pye 1968; Dormer 1994, 1997; Sennett 2008; Adamson 2007, 2013).

At the same time, the growth of social anthropology, especially as pursued by E. E. Evans-Pritchard (1902–1973) in his study of the magic and witchcraft of the Azande (Evans-Pritchard 1937), came to the attention of philosophers of science in the 1960s and 1970s who made use of it to argue for the symmetry of “science” and “pseudoscience” as knowledge systems. In the wake of this work, studies of indigenous knowledge systems in anthropology and in the anthropology of science multiplied, leading to the view that modern science can be regarded as simply another such knowledge system (Watson-Verran and Turnbull 1995). In a series of important ethnographic studies on “everyday mathematics,” social anthropologist Jean Lave made clear that cognition takes place in quotidian practices (Lave 1988; Lave and Wenger 1991; Chaiklin and Lave 1993).

All these various strands of scholarship brought about a sea change in the history of preindustrial science, because they validated the study of knowledge systems and practitioners who could not be fit into a linear teleological history of the development of modern science. The idea that the history of science did not have to take as its task the explanation of how the present day state of scientific knowledge emerged has resulted since the early 1980s in a significant change in the conception of the goals of the history of science, which came to include the history of “dead ends” such as alchemy and astrology, of ignorance, and of the knowledge systems of artisans and practitioners (Smith 2009).

Two further developments in the study of science, technology, and medicine have brought forth more intensive explorations of craft knowledge. The first occurred during the 1980s in several different centers, including Paris, Edinburgh, and various universities in the UK, when sociologists of knowledge began to focus on the social construction of scientific knowledge (abbreviated SSK) (Golinski 2005). Their research included some exploration of laboratory work, including the relationship between technique and theory,

and the role of lab technicians and their bodily knowledge in the scientific enterprise, but this was generally not their primary focus. Nevertheless, this work helped inspire a study of the ways in which bodily “gestural knowledge” (influenced also by the work of François Sigaut) played a crucial role in historical scientific experiments (Sibum 2000; Chang 2011; Fors et al. 2016). Meanwhile, in *Personal Knowledge*, chemist and philosopher Michael Polanyi (1891–1976) focused explicitly on bodily and tacit knowledge in the natural sciences (Polanyi 1958; Collins 2010). Informed by this research both on tacit and on gestural knowledge, historians of science began to explore the methodology of recreating scientific experiments in order to better understand their actual historical course. Recently, this method of reconstruction has been extended more broadly to historical experiential knowledge and craft practices (Smith 2012, 2016; Smith et al. 2016; Fors et al. 2016).

Impact and Legacy

All these developments in the study of scientific knowledge opened the way for the bodily knowledge of craftspeople to be regarded as significant – even central – for the study and understanding of epistemologies of natural knowledge. Roughly from the 1990s, historians of science began to study a very diverse range of practitioners – including craftspeople – who were not primarily university-trained scholars nor “new experimental philosophers,” but who engaged with nature and natural materials in a great variety of ways, including directly transforming natural materials as a part of a craft or of alchemy, formulating vernacular knowledge systems about natural processes, or calling upon the authority of nature in making claims to certainty. Historians of science who studied this diverse group of largely non-elite practitioners formulated the notions of “makers’ knowledge,” “vernacular science,” and “artisanal epistemology,” expressing thereby a newfound sense that craftspeople possessed a philosophy, a science, or a “knowledge system” (van Berkel 1985; Pérez-Ramos 1988; Egmond 1999; Smith

2004; Roberts et al. 2007; Harkness 2007; Long 2011). In contrast to previous understandings of craft, these historians disputed that craft practices were rote and mechanical, arguing instead that craftspeople carried out their techniques in light of a coherent set of principles, but that these principles were often codified in objects, in tools, in rituals, or in songs – in other words, in types of externalizations of knowledge other than writings.

These historians have, for example, described the vernacular epistemology of midwives (Fissell 2006) and the artisanal epistemology of artists, including painters, sculptors, and metalworkers (Smith 2001, 2004, 2010, 2011). The artisanal epistemology, as contained in preindustrial craft practices, and in the writings of practitioners and their books of recipes, includes artisans’ claims that nature and experience are foundational to their knowledge, with certain or positive knowledge contained in the materials of nature, which must be extracted by the practitioner through bodily struggle. Their search for knowledge is thus active – knowing is doing. This process of struggle often takes the name of “experience” and is learned and explicated through imitation and replication of natural processes. This imitation of nature produces an effect – an intervention in the material world such as a work of art – which both displays and constitutes knowledge. Bernard Palissy (ca. 1510–ca. 1589), ceramicist and author, laid out such a view explicitly in his writings, calling this knowledge a “philosophy of laborers.” He and other artisans, such as Albrecht Dürer (1471–1528), saw this method of imitating nature as a cognitive process (Lestringant 1992; Smith 2004). Imitation as a mode of gaining knowledge for these artists thus simultaneously constituted an aesthetic striving, an articulation of an artisanal epistemology (sometimes in textual form and sometimes in the material form of made things), an investigation into the properties of natural materials, and, at its most basic and all-encompassing, it was simply a mode of going about skilled work (Smith et al. 2016).

The artisans’ epistemology emerged in part from their training by apprenticeship in which bodily techniques of observation, imitation,

repetition, and active doing were modes of work and knowledge transmission. This epistemology, as articulated in texts, in conversations with scholars and patrons, and in naturalistic works of art, suggested that direct access to nature was both possible and necessary, that knowledge was gained through bodily engagement with matter, that “scientific” knowledge (in Aristotle’s sense of “*scientia*”) could be extracted from nature, and that the imitation of nature yielded productive knowledge. The articulation of this epistemology – in part by the artisans themselves and in part by intermediaries such as Theophrastus von Hohenheim, called Paracelsus (1493–1541), and Georgius Agricola (1494–1555) – created an identity through which practitioners could express claims to authority on the basis of their hard-won knowledge of natural processes (Smith 2004, 2014, 2015). The artisanal epistemology thus played an important role in the Scientific Revolution, as, through the articulation of this vernacular epistemology in objects and texts, European artisans in the fifteenth and sixteenth centuries engaged in making direct access to nature and the production of effects count as “*scientia*,” that is, as certain, positive knowledge (Smith 2004).

Epistle in the Renaissance

Laura Carotti

Scuola Normale Superiore, Pisa, Italy

INSR, Florence, Italy

Abstract

The epistolary genre flourished intensely during the Renaissance; if the fifteenth was the century of humanistic Latin epistolography, in the sixteenth century there arose a “fashion” of books of letters in the vernacular and even treatises on the subject. However, over the course of the century, the original vitality of the letters gave way to their complete codification.

Synonyms

[Letter in the Renaissance](#)

Innovative and Original Aspects

In the thirteenth century, epistolary correspondence began to spread rapidly; on the one hand, letter writing in the vernacular emerged in the merchant class – which usually had little knowledge of Latin – and on the other hand, a tradition of cultured epistolography developed in both the vernacular and in Latin (Petrucci 2008).

Francesco Petrarca in particular, with his collections of Latin letters (the *Familiars*, the *Seniles*, the *Sine nomine*, the unfinished *Epistola post-eritati*, and the *Epystolae* in hexameters), founded this new genre of correspondence as a literary work, modifying classical antecedents according to the process of recovering ancient sources that would also be followed by Coluccio Salutati, and would converge in humanistic Latin epistolography. The fifteenth century saw numerous publications of letters by classical authors such as Cicero, Pliny, and Seneca, in Latin or in the vernacular translation; they were joined by books of humanistic correspondence, and miscellaneous and technical epistolary manuals in Latin, such as those by Erasmus of Rotterdam and Justus Lipsius. Worth mentioning in this context is the *Epistolarum familiarum libri* by Marsilio Ficino (Ficino 1988, 2010), published in Venice in 1495, made famous by the vernacular edition proposed between 1546 and 1548 by the Siennese Felice Figliucci (Figliucci 2001). In addition to reflecting the consolidation of the epistolary literary genre serving to reveal an intellectual's progress, since the Florentine humanist utilized his letters to trace the evolution of his own philosophical development, the *Epistolarum familiarum libri* are also the place of choice for the author to subject to critical scrutiny any ideas that had found or would find a place in his works.

Thanks to the rapid development of printing, the sixteenth century saw the growth of a double phenomenon: on the one hand, famous poets such as Pietro Aretino (Aretino 1995) and Annibal Caro (Caro 1957) published their letters, and shrewd editors, aware of an audience interested in the genre, printed anthologies (the most successful, arriving at 28 editions between 1542 and 1567, was *Lettere volgari* edited by Paolo Manuzio; Manuzio 1545). On the other hand, following humanist epistolography manuals, similar treatises in the vernacular appeared, beginning with *Secretario* by Francesco Sansovino, published in 1564.

Progenitor of all subsequent books of letters in the vernacular are the *Lettere* by Pietro Aretino, whose first book saw the light in 1538: the immense public success of Aretino's correspondence marked

the beginning of a real fashion, standing out even with regard to the typography (Quondam 1981; Matt 2005).

The books of letters were characterized by their divisions according to type: along with "family letters," there were witty, loving, spiritual, and moral ones, to name just a few, that maintained a dense intertextual reference network with other literary genres (the amorous letters with collection of poems, facetious letters with comedy and short stories, and so on).

Among letters qualifying as "comic," are the *Pistole vulgari* by Nicolò Franco (Franco 1538) in 1539 in which a jocular tone is achieved thanks to stylistic devices such as verbal accumulation, the *Tre libri di lettere del Doni e i termini della lingua toscana* by the polygraph Antonfrancesco Doni (Doni 1552), printed in 1552, in which the rhetorical space of the epistolary genre is constantly "distorted" by the use of stories and parables; and the *Lettere* of Andrea Calmo (Calmo 1888), singular in his use of Venetian. Although the category of witty letters was one of the richest and most interesting types of the sixteenth century, it too was destined to undergo the gradual crystallization which the entire epistolary tradition met; evidence of this process is the *Argute et facete lettere* by Cesare Rao (Rao 1585), in which the comic components are now limited to following established patterns.

After springing from the fertile soil of humanist comparison, in the late sixteenth century and throughout the following century, the book of letters became a mere collection of carefully indexed formulas. The aim of this editorial type became the creation of a stereotyped handbook; the same demand gave rise to *Secretario* by Francesco Sansovino, a tract on the role of the secretary at court – which enjoyed as many as 14 editions between 1564 and 1608 – where writing letters was reduced to a problem of *elocutio*, while the *inventio* was standardized according to preestablished categories (Braidà 2009). The originality that characterized collections in the 1540s and 1550s was now lost, and in the seventeenth century the book of letters became the *vademecum* of the courtier.

Erasmus, Desiderius

Born: Rotterdam? 28 October [1466?]

Died: Basel, 11/12 July 1536

Cecilia Asso

Pisa, Italy

Abstract

Erasmus was the most important humanist of the sixteenth century. His work in theology and education deeply influenced the European culture of his times and of subsequent centuries. In theology and ecclesiology, he was a reformer, criticizing the doctrine of sacraments and condemning the existence of the religious orders and the role of their exponents as theologians, preachers, and inquisitors. He radically refused Scholastic theology as well. His view of Christianity and the Church as a community was an evangelical one, and he believed that salvation for mankind could only be found in Christ, understood as the Word of God made incarnate in the written words of the New Testament. For this reason, he dedicated his theological activity to the philological study of the text of the New Testament and to the works of the Church Fathers, making this the main purpose of his life. Conversely, he refused to join the Lutheran movement, which he considered schismatic, and condemned any form of aggressive dissent. He stayed faithful to the Pope of Rome, believing in a theological and moral reformation without rifts in the body of the universal (Catholic) Church. Alongside his theological work, his writings on education focused on the moral reform of Christian people. Children, women, common men, and men of power are the addressees of books that became classics (e.g., the *Colloquies*, first published in 1518). In line with his humanistic thinking, he greatly appreciated rhetoric as an excellent means of communication, whereas he considered dialectics a dangerous science. Many of his writings are conceived as examples of the art of rhetoric, and let his brilliant and creative style come

through at its best. The *Praise of Folly* (first published in 1511) is the most famous of these examples.

Biography

Erasmus was probably the illegitimate son of a priest. His father's name was Gerhard (Geert, Gerardus), his mother's Margareta. He had an elder brother, Peter. E. spent his very first years at the home of his grandmother. When he was about four, his father made a first attempt to send him to school. But the child did not achieve good results, due to the antiquated and strict method of teaching being used at that time. At nine he was sent to school at Deventer, where he took up residence with his mother. In Deventer he remained till he was 13 (c 1479), when the plague killed Margareta; he therefore went back to Rotterdam, where, shortly after, his father died, too. Gerhard entrusted Erasmus and Peter to three guardians, including Peter Winckel (teacher at a nearby school in Gouda). They had to manage the quite considerable family assets and take care of the education of the two boys. Probably in 1480, when E. was about 14, although ready for university, he was sent to Bois-le-Duc to live in a house of the Brethren of the Common Life. He unwillingly spent 3 years there ("There [he] lived, rather wasted almost three years," *Compendium Vitae Erasmi*, Allen I, p. 49, ll. 52–53). He went back to the home of his guardians because of a new plague, as he was in the grip of the quartan fever. At this point, he underwent heavy pressure to persuade him to take religious vows. Due to the bad administration of his guardians, the legacy left by his father had vanished and the only solution for the two young brothers was to enter a monastery. Erasmus, now 17, felt deep repugnance for monasteries, but quartan fever and harassment by his guardians made him malleable, and he eventually agreed to enter the monastery of the Canons Regular of Saint Augustine in Steyn (Emaus), near Gouda (probably in 1484). His initial intention was to leave before professing monastic vows, but pressed as he was by necessity and threats, at the moment of taking a decision he

felt obliged to do it. He took the Augustinian habit, took the vows of poverty, chastity, and obedience, and in 1492 was ordained as a priest. Meanwhile, secretly, and despite having to face frequent reproaches from the fathers ("furtive et reclamantibus patribus", Ep. 1436, ll. 98–99), he succeeded in studying, taking advantage of the monastery library, and so gradually acquired a classical education, and a Latin style well above the average. About 1494, Henry of Bergen, Bishop of Cambrai, who was aspiring to become a cardinal, began looking for a secretary with a good knowledge of Latin. Someone suggested to the bishop the name of Erasmus, who obtained from the Bishop of Utrecht permission to leave the monastery and move to Henry's court. When the longed-for cardinal's hat did not arrive, Henry lost interest in the young secretary and let him go to Paris to study theology. Jacob Batt (c 1466–1502), a friend Erasmus had met at the court of Cambrai, helped him to obtain the required permission. In the summer of 1495, at the age of 29, Erasmus enrolled at Montaigu, the college for poor students at the University of Paris. At Montaigu the Rector was Jan Standonck (d 1504). Erasmus respectfully remembered that austere man for his attitudes towards faith and his commitment to a spiritual reformation, but criticized him bitterly for the inhuman physical conditions in which the young guests at Montaigu had to live. For that reason, and because of the recurrence of plagues during his years in Paris, Erasmus often went back to "Hollandia," sometimes to Antwerp, other times to St. Omer, or Louvain. Henry of Bergen had promised him an annual allowance that was never paid, so Erasmus gave private lessons and began to publish some short works in print to be dedicated to rich patrons. In these years he went for the first time to England (summer-autumn 1499) following the invitation of his pupil William Blount, fourth Baron of Mountjoy (c 1478–1534). During this first visit, he met in London Thomas More (1477/1478–1535), who became a lifelong friend of his, and in Oxford John Colet (1467–1519), with whom Erasmus shared an interest in biblical studies and children's education, and who probably influenced his decision to dedicate his time to the philological study

of the New Testament. The *De duplici copia verborum ac rerum* (Paris, Badius, 1512) was dedicated to Colet and to the pupils of Saint Paul's School in London, which Colet had founded in 1509. Once back in Paris, E. published the first edition of the *Adagia* (*Adagiorum collectanea*), a collection of proverbs from pagan and Christian antiquity, and dedicated it to Mountjoy. In 1503 he published with the Antwerp printer Thierry Martens the *Lucubratunculae* (*Little Dissertations*), a collection of devotional writings including the *Enchiridion Militis Christiani* (*The Handbook/Dagger of the Christian Soldier*), the most important of his spiritual works. In the *Enchiridion* Christian people are exhorted to follow a personal form of religion independent of ceremonies, to be lived in the intimacy of one's own heart (*in interiore hominis*). Right from the start, the *Enchiridion* had an extremely favorable reception and found in Martin Luther one of its most enthusiastic readers. In 1504 the *Panegyric of Philip of Austria* (Antwerp, Thierry Martens) marked a first link between Erasmus and the Habsburg dynasty and earned a conspicuous reward. In 1505 Erasmus published in Paris with the printer Josse Bade (Badius) the *Annotations* that the Italian humanist Lorenzo Valla (1407–1475) had written to the Vulgate Latin text of the New Testament. During the previous summer – as E. tells us in the preface – through his habit of hunting for ancient manuscripts, he had found Valla's *Annotationes* in the library of the Premonstratensian Abbey of Parc, near Louvain. In 1505, till approximately the first half of 1506, Erasmus travelled to England for the second time. During this visit, he met William Warham (1456–1532), Richard Foxe (d. 1528), and John Fisher (1469–1535), was introduced to the Cambridge milieu, and dedicated himself to the study of Greek. In London he was guest of Thomas More, and with him translated some of the *Dialogues* of Lucian of Samosata, published at the end of 1505 in Paris by Badius. During his English visit, the king's physician, the Italian Giovanni Battista Boerio, asked him to accompany his two sons on an educational tour through Italy, as supervisor of their studies. As a result, after a few months spent in

Paris, Erasmus arrived in Italy at the end of summer, 1506. On September fourth he was awarded a doctorate in Theology in Turin (Allen, vol. I, p. 59, ll. 108–110; Ep. 200 and 201). He stayed with his pupils in Bologna till approximately the end of 1507, except for taking refuge in Florence at the time of the war between the Pope and Bologna (Ep. 200). At the end of 1507 his duties in training the young Boerios finished, and E. went to Venice, where he presumably stayed right through 1508. In Venice he lived as a guest in the home of the printer Aldus Manutius (1449–1515). There he made the acquaintance of the scholars who worked with Manutius and made friends with Girolamo Aleandro (1480–1542), with whom he shared a bedroom (Ep. 2443). In Venice he worked on an enriched edition of the *Adagia*, printed by Aldus in September 1508. At the end of 1508 he moved to Padua, where he was requested as a tutor to Alexander (1492–1513) and James (1499–c 1544) Stewart, natural sons of James IV, King of Scotland, and dedicated himself to studying Greek (de Nolhac 1898, pp. 55–56). In December 1508, after a brief stay in Ferrara, he went on to Siena with his pupils. Here he left the boys, to continue on to Rome, where he stayed during the winter. After returning briefly to Siena, in 1509, E. left again with Alexander for Rome, where he spent Easter (eighth April), and then went to Naples (CE, s.v. Alexander STEWART). It was in this period that he received from his beloved pupil (who was to die at 20, fighting side by side with his father in the battle of Flodden, 1513) a ring carrying an ancient precious stone representing the god Terminus. Years later, Terminus, accompanied by the motto *Concedo Nulli*, would become Erasmus' symbol (Ep. 1558). After a few more months in Rome, he decided to go back to England, following a warm invitation from his former pupil Mountjoy (Ep. 215). English men of letters were, indeed, very hopeful about the young and well-educated King Henry VIII, who came to the throne in April 1509. The most probable moment of E.'s arrival in London was at the beginning of July 1509 (de Nolhac 1898, p. 92). Once there, he lodged again at Thomas More's and set to work on revising the text of the *Praise of Folly* (*Stultitiae*

Laus), resuming the work he had begun during the return journey from Italy and would be printed for the first time in Paris, by Gille Gourmont, in 1511. Erasmus stayed in England till the summer of 1514, except for a brief move to Paris. In 1513 the Basel printer Johannes Froben reprinted the *Adagia* on the basis of the Aldine edition of 1508. This work was destined to be very successful and went through nine more editions, each richer than the previous one, up to 1536. Being very satisfied with Froben's work, in autumn 1514 E. moved to Basel to launch an editorial project that was to occupy the rest of his life. In Basel he went to live in the great Froben's estate, known as "zum Sessel." Froben became his close friend, and Froben's family became the only real family Erasmus had till his death. From then on, Erasmus would pass many times through Europe, sailing down the Rhine to return to England and the Netherlands, but his main center of interest remained Basel, the free imperial town that freed him from court duties and, as far as possible, kept him away from religious conflicts, at least till 1529. In 1516 Erasmus' project of editing texts for an authentic reform of Christianity began to materialize. In June, the *Life of Saint Jerome (Hieronymi Stridonensis Vita)*, the philologist Father and, in Erasmus' view, the best example of a learned man who was also a Christian ascetic, was published. Soon after, the *Novum Instrumentum*, a New Testament edition with the Greek text and the Latin translation revised by Erasmus, followed. A separate volume contained the *Annotations*, which were Erasmus' commentary; in that volume the reasons for his textual choices were explained. Froben would print four other authorized editions (1519, 1522, 1527, 1535) of this seminal work. At the same time Saint Jerome's *Works (Opera omnia)* were printed, as the result of a great amount of work that had been divided up between the main Basel humanists, first of all the Amerbach brothers Bruno (1484–1519), Basilius (1488–1535), and Bonifacius (1495–1562). Editing Jerome's *Letters* was the part of the project taken on by Erasmus: four volumes that required of him – or so he claimed – an effort devoted to correcting greater than that made by Jerome in writing them

(Ep. 396). Jerome's edition was the first in the hefty series of editions of the Church Fathers (the Christian authors of the first four centuries) to which Erasmus dedicated his best energies throughout the remaining years of his life. Meanwhile, in January 1516, Erasmus had been created counselor of the 16-year-old Charles of Habsburg (1500–1558), who had just inherited the Spanish possessions of the family (including American colonies) from his maternal grandfather, Ferdinand II of Aragon. When added to the Habsburg possessions in central Europe, this heritage gave Charles a much wider-ranging dominion in the world. Among the counselors to this young prince, there were several men of refined humanistic culture. One of these, Jean Le Sauvage (1455–1518), counselor for Brabant, successfully worked to get the position of counselor assigned to Erasmus. It should have brought with it a reward of 2000 florins a year, which was, however, only occasionally paid. For this new pupil of his, Erasmus published *The Education of a Christian Prince (Institutio Principis Christiani)*, (Basel, Froben, 1516), where the principles of his pedagogy are applied to a boy on whom the happiness or the ruin of the world depended. The counselor's new position implied the obligation to frequent the Court, an activity not well suited to Erasmus' temperament. In particular, when in 1517 Charles moved to Spain to take possession of his new reign, Erasmus succeeded in avoiding the journey, even though he had to accept staying in Brabant, more precisely, residing in Louvain. In that city he was expected to establish a good relationship with the members of the prestigious Faculty of Theology, founded about a century earlier, at the end of the Great Schism, as a bastion defending the authority of the Pope against the Faculty of the Sorbonne in Paris, which supported the theories in favor of Conciliarism. So, after a brief stay in England, a country to which he would never return, in the summer of 1517 Erasmus moved to Louvain and settled there until 1521. His relationship with the Faculty of Theology, however, was troubled, and a long series of theological quarrels started in this period, taking up much of Erasmus's time till the end of his life. The main cause of discussion was his edition of the New

Testament and the theological consequences that derived from it. Erasmus's adversaries explicitly charged him with irreverence towards ecclesiastical traditions, and, above all, of heresy in his attitudes to the basic dogmas of Christianity, starting with Christ's divine nature and the doctrine of the sacraments. From Louvain the charges directed against E. were destined to spread to Paris and Spain, where theologians made common cause with their colleagues in Brabant against what they saw as dangerous Erasmian novelties. This rift with the exponents of traditional theology bitterly marked the life of Erasmus, who hated polemics and apologies but would unfailingly send a pointed answer to everyone who attacked him. In this connection, we can recall his replies to Maarten van Dorp (1485–1525), Jan Briart of Ath (1460–1520), Nicolaas Baechem of Egmond (d 1526), Latomus (Jacques Masson, d 1544), Edward Lee (d 1544), Stunica (Diego Lopez Zúñiga, d 1531), Noël Bedier (Beda, 1470–1537), Johann Maier von Eck (1486–1543). Erasmus did not achieve a reconciliation with any of them, except Dorp, who remained his devoted friend till death. The writings produced in this period brought an official condemnation in 1527 from the Paris and Valladolid Faculties, and 30 years later they were used in Rome and Trento to build a definitive condemnation by the Roman Church of Erasmus's works. On the other hand, in Louvain Erasmus inspired the foundation of the Collegium Trilingue (1517), a University college where the three biblical languages (Latin, Greek and Hebrew) were studied, financed thanks to the testament of Jerome de Busleyden (c 1470–1517), a rich and cultivated Erasmus's friend.

To help him in the task of completing his Christian editorial project, Erasmus began to publish paraphrases of every book in the New Testament. In 1517 the *Paraphrase of the Epistle to the Romans* was published. Meanwhile, in Germany, quarrels against ecclesiastical abuses and ceremonies reached fever pitch. The Lutheran doctrine that condemned human works in view of attaining the salvation of the soul spread widely, and Erasmus was seen as the champion of a Germany ready to rise up against Rome. In this phase, Erasmus did not back away from the enthusiasm

of the Germans. With Luther he exchanged a number of letters showing mutual esteem and a consciousness that they were fighting for the same cause. It was in this period that an anonymous libel entitled *On the Death of Julius* (*De obitu Iulii*) began to circulate in Germany. It was to become known later as *Julius Excluded from Heaven* (*Iulius exclusus e coelis*) and was a ferocious satire of Pope Julius II, who had died in 1513. The author imagines the warrior pope kept away from the doors of Paradise by Saint Peter in person and being condemned to Hell along with all the soldiers to whom he had misleadingly promised eternal salvation. Erasmus always denied the authorship of this work, but it seems to have been definitively demonstrated. In this period, Erasmus' editorial activity was intense. Inter alia, in 1517 the first authorized collection of his epistles was published (*Epistolae sanequam elegantes*, Louvain, Thierry Martens), a kind of book that had a resounding success in the sixteenth century, and was widely imitated. At least 14 other editions of Erasmus's epistles followed till the end of his life. In 1517 he also received from Rome an exemption from wearing the habit of the Augustinian order (Ep. 296, l. 186n), a practice that was the subject of heavy reproaches brought against him by his enemies throughout the rest of his life. In 1518 the *Ratio verae theologiae*, one of the prefaces to his edition of the New Testament, was enlarged and printed in a separate volume. Along with the *Enchiridion*, it constitutes the manifesto of Erasmus's Christian philosophy, based on studying the Scriptures and imitating the model they put forward. In 1520 Froben published the *Antibarbari* (*Against Barbarians*), a dialogue in which the reasons of the humanistic studies are discussed against the arguments in favor of the Scholastic theology, having Erasmus's old friend Jacob Batt as the main and winning character.

At the end of 1521, Erasmus went back to live in Basel, where he stayed for 8 years. In 1522 Froben printed the first edition of the *Colloquies* (*Familiarum colloquiorum formulae*), dedicated to Erasmus' godson Erasmus Froben, son of Johann, who was 7 years old at the time. This work too was destined to have widespread success

and become one of the seminal books in Europe for the education of young people. There were ten further editions, each enlarged on the previous one, that were printed during Erasmus' life. In this period, in addition to his intense activity of publishing Christian and classical works (above all, the *Paraphrases* to the New Testament and Pliny the Elder's *Natural History*) he had to write more *apologies*, not only against the pro-Roman theologians, but also against Luther's followers, who pressured him to openly support their cause. The controversy with Ulrich von Hutten (1488–1523), a German humanist and a fervent admirer of Erasmus, who in 1515 had hailed him as the German Socrates, was a particularly painful one. Erasmus had welcomed Hutten's friendship, but always refused to support his military initiatives (invariably failures) against the Roman Church, until in 1523 the two entered into a written clash that ended in August with the death of Erasmus's enemy. Meanwhile, Charles of Habsburg had become Emperor Charles V (1519), and his counselors exerted strong pressure on Erasmus to publicly distance himself from the schismatic movement. Eventually, in 1524, he decided to write the *De libero arbitrio diatribè* (*On Free Will*), which led to an aggressive answer by Luther, the *De servo arbitrio* (*On the Bondage of the Will*), followed by other polemical writings from both sides. This controversy marked the end of the previously good relationship between Erasmus and the "Lutheran party," who for centuries would charge him with cowardice and moral weakness. By contrast, when, in 1525, the Peasants' War, inspired as it was by Anabaptist doctrines, led to widespread destruction and repression in Germany, Erasmus's behavior was much more tolerant than Luther's. Indeed, though condemning rebellions and the use of physical force against secular authorities, he wrote in a way that showed significant sympathy towards Anabaptism (Asso 2006).

In the autumn of 1527, Johann Froben, Erasmus's fraternal friend, died, and his elder son Hieronymus (1501–1563) succeeded him as the man in charge of the publishing house.

In 1528–1529 Erasmus got involved in a literary polemic with some Italian humanists, and

published the *Ciceronianus* (*Cicero's Follower*), where he criticized the stylistic cult in Italy that had Cicero as its focus. This polemic was also connected with the theological clash with the Italian prince Alberto Pio of Carpi (1475–1531).

In spring, 1529, the town council of Basel decided to welcome the Reformation. The main theological guide of Basel at the time was Johannes Oecolampadius (1482–1531), a humanist and an old friend of Erasmus, but there were violent clashes in the city, and Erasmus, fearing for his personal safety and his property, moved to Freiburg, where he was welcomed with great honors (Ep. 2158). Though his health was becoming increasingly precarious, he continued to follow the Froben publishing house and to publish classical and patristic works under its imprint. Meanwhile, his best friends in England fell into disgrace for refusing to recognize the king as the head of the Church of England. In late spring, 1535, Erasmus went back to Basel for reasons that are not well documented (Ep. 3025). Shortly afterwards (summer 1535), Henry Fisher and Thomas More were beheaded in the Tower of London. Erasmus passed the last year of his life in his old lodging at the house of Froben, lovingly cared for by his friends, above all Beatus Rhenanus (1484–1547), Erasmus' administrator for many years and the future executor of his will. Heavily troubled by arthritis and dropsy, Erasmus was finally struck down by dysentery, which led to his death on July 12, 1536. He was buried in the Basel cathedral.

Innovative and Original Aspects

Like every man of his age, Erasmus considered the problem of salvation a central one. Indeed, in early modern Europe, endemically scourged by wars, plagues, and famines, the issue of how a man could avoid the "second death" – that of the soul – was a very important one. Erasmus' answer was that the only means of salvation for human beings is Jesus Christ, the Word (*Logos*) by which God had decided to save them. God revealed himself through the teachings of Jesus, which can be found in the Gospels, the Acts of the

Apostles and the Epistles. Any individual looking for salvation should therefore turn to the New Testament and never feel tired of reading or reflecting on it. But the Holy Scriptures reached us written in natural languages not easily comprehensible to the common people – Hebrew, Latin and, above all, Greek. Not everyone had the time or capacity to study them. For this reason, as argued by Erasmus, there is room in Christian society for people who wish to dedicate themselves to the Scriptures, and explain them to others. Such people, however, did not acquire any peculiar power to impose one interpretation rather than another; they could, in fact, be controlled and criticized even by the people they were teaching at the time. These considerations explain why Erasmus dedicated the best of his time and energies to editing the New Testament and the works of the Church Fathers (the Christian authors of the first four centuries), who were considered by him to be the best examples of moral and theological teaching. This editorial activity, sharply focused on the education of Christian people, had a counterpart in Scholastic theology, the theology of the “moderns,” as it was called in the universities. Erasmus considered it a deceptive replacement of the teaching of the word of God, capable of corrupting the intellect and morals of Christians by the wrong use of logic and dialectics. The main resource of the Christian teacher is, inevitably, rhetoric, the art of persuasion of which, in Erasmus’ opinion, the Apostles and Jesus himself were masters.

Apart from the biblical and patristic editions, the educational writings of Erasmus explicitly aim to bring about a reform of Christian society. To widen the scope of the discussion, it is now time to give an overview of his vision of mankind and human society.

Erasmus had a rather pessimistic idea of human nature. It must be shaped and well directed starting with the earliest days of life. Otherwise, if left alone, it will unavoidably tend towards evil. This matter of fact, Erasmus says, is the heritage of Original Sin, which the Scriptures and the Fathers of the Church speak about, but the best resource that human beings have to save themselves is not a sacred rite, such as baptism, but a

focused and constant activity of educating people, in body as well as in mind. For this reason education should first take a physical form. Like a little clay vase, a new-born baby must be so modeled that, when its mind develops, it will be able to become home to the message of redemption in the best way. At the roots of the Erasmian pedagogy, we can thus observe a strong materialistic concept of human nature. A sick or malformed body will prevent the mind from developing and from adequately receiving Christian teaching and Divine Grace. Erasmus does not specify what is likely to happen to the innocent victims of this kind of bad situation if no one is at hand to help them, but it is clear that parents and teachers must make every possible effort, first of all to guarantee to each child physical health and a good Christian education. That principle explains why a good Christian should take the greatest care of his/her body in all the successive phases of life. Personal care, being wary of infectious diseases (and for this reason being suspicious of mixed environments), using personal utensils like handkerchiefs, cutlery, glasses to drink from, also living in healthy, well-ventilated rooms, following a simple but nutritious diet while avoiding fasting and a selective diet, all these recommendations are frequent in Erasmus’s writings, but, in contrast with what we might think, they are strictly functional to the salvation of one’s own soul. Being personally fed and cradled by a Christian mother is the first step towards a Christian education. Following a humanistic model that he borrowed from the Greek philosopher Plutarch, Erasmus recommends that mothers breastfeed children, to allow them to acquire the best and most natural nourishment, but at the same time receive the morality and religious feeling of the mother. If the only possible way to ensure breastfeeding is entrusting the baby to a wet nurse, she must be chosen only after careful selection; she should not only be tidy and trustworthy, but a good Christian as well, because a wicked, corrupt, or impious woman would instill her bad qualities into her baby through her milk. The father will take care of the correct implementation of this first, delicate phase of his child’s life. Even this is one of the innovations in Erasmus’s views compared with more

traditional attitudes. Following Quintilian, the ancient Latin author of a work on rhetoric and education (*Institutes of Oratory*) who was greatly esteemed by the humanists, Erasmus places the father at the center of family life, giving him the role of being the main teacher of his wife and children. Erasmus condemns one of the common practices of his times, which was widespread in noble but also in middle-class milieux, of entrusting children to women and rough servants almost up to the age of puberty. In this way – Erasmus maintains – boys and girls indelibly absorb the worst flaws that have their origin in a lack of education: superstition, lasciviousness, aggression. When such children reach adulthood, it will be impossible, even for the best of the teachers, to change them into honest men and true Christians. What is worse, if they possess power and money, they will become a curse on their community.

When a child begins to understand and speak, he/she should listen to fables and songs that are pleasing and amusing, but also in compliance with Christian morals; they should contain the first religious teachings. When growing older, that child will receive a more complex and deeper kind of teaching, but it should still take a pleasant form, and be combined with various traditional religious practices, such as the Mass and the cult of the saints, which, in Erasmus's opinion, are not a really important component of religion, but do constitute a good introductory pathway leading into it. These material and childish religious practices may be permitted even to adult people who have not yet managed to develop in their piety, or to people recently converted to Christianity. Erasmus calls these people *infirmi* (weak), using an expression that derives from Saint Paul.

Thus, at the center of Christian society, there is the institution of the family, based on Christian marriage and governed by the father. People who want to dedicate themselves to religion, as seen above, have as their main task that of studying the Scriptures, so as to become capable of teaching them to the people. This is not a mediation between God and ordinary people, like that found in the traditional Church. Everyone is free to study and interpret the Word of God. The priest

simply helps people who are unable to study by themselves. If a priest has a vocation to chastity, that is a good thing, as Saint Paul says, but if not, then he must channel his sexuality and affectivity into marriage.

Likewise, the role and education of women plays an important part in Erasmus' vision of a reformed Christian society. In early modern Europe, the "status" of women's (their social condition) could only – accordingly to Roman law – belong to one of three main categories: virgins, married women, and prostitutes. In Erasmus' writings, this scheme underwent a radical change. As to virgins, nunneries are seen by him with horror as places encouraging idleness and corruption. A woman who does not wish to marry and prefers to dedicate herself to prayer and charity may do so, Erasmus suggests, by remaining in her father's home. On the other hand, women who decide to marry, when they have fulfilled their duty of giving birth to children, should live in chastity, each with her own husband. In Erasmian society, there is no room for prostitution. Brothels (just like cloisters) must remain empty, and the women who live like slaves there must be reintegrated into society, their only choice being between marriage and chastity.

Generally speaking, Erasmus condemns every aspect of the life of religious orders. More exactly, the main object of his polemic is the mendicant orders, whom he charges with having appropriated the right to preach and to administer sacraments to the people, a right that should be given back to priests. The wish to become isolated from society in order to pray and study may be understood, and Erasmus sympathizes with it in his writings. But it should only be enacted by following the model of ancient monasticism and of the earliest followers of Saint Benedict. By contrast, the system of the wandering and begging friars that flourished during the life of Erasmus aroused in him no more than a feeling of disgust. In his opinion it would be useless to reform or amend any such system, just because its functions should find a natural place in every common Christian's life. Prayer, chastity, and poverty were, in the broadest sense, the duties of every Christian, even though those who wish to practice them

more strictly may do so by remaining inside society and earning their living with dignity.

Adopting all due caution, we can say that Erasmus's model of society is fundamentally "bourgeois." He nourishes a profound aversion for the culture of feudal nobility that triumphed in Europe during his lifetime. Despising manual and intellectual work, loving weapons and hunting, having habits free of morality, being haughty and overbearing towards others, were characteristics typical of noblemen that Erasmus openly detested and bitterly mocked.

As for politics, from Erasmus's writings, an overall picture of towns ruled by self-government and obedient to the emperor seems to emerge. In June 1517 he seemed to consider the imperial institution as having decayed (Ep. 586), but when the Lutheran fracture became more and more evident and Charles of Habsburg became emperor (1519), ruling over more than half of Europe, the hope of finding a solution to religious and national conflicts under a revived imperial authority seemed to attract him. At this point it should be stressed that Erasmus always passionately condemned war between Christians and constantly appealed to European princes to resolve their controversies by diplomatic means. His idea of toleration should be kept in mind here. Actually, in his opinion, none of those who receive the Gospel of Jesus Christ, the Word of God, may be considered outside Christendom, and killing a brother for any disagreement over faith is unacceptable. On the basis of that opinion, none of the European wars in the sixteenth century should ever have been fought. On the other hand, people who are not part of Christianity, such as Muslims, must be converted, and, to carry out this task, war may be waged, even though it must be a means of last resort after attempts have been made to live in peace. It must also be noted that Erasmus's toleration did not apply to Jews or their culture, which denies the historical existence of Jesus Christ. From this standpoint, Erasmus contributed to the development of anti-Judaism, which is one of the historical roots of modern anti-Semitism.

The problem of reforming the Church in the sixteenth century was a political one, and, from the perspective of Erasmus, it seemed to coincide

with the reformation of Christian society as a whole. The distinction between clerics and laymen, which, at the end of the Middle Ages, shaped European society, in the writings of Erasmus appears to be so weak it can hardly be discerned. As seen above, Erasmus condemns without appeal the status of religious orders, maintaining that anyone who wishes to dedicate their time to monastic life may live in isolation from society, but cannot constitute a separate juridical or economic *corpus*. As for taking care of the souls, it is a duty that belongs to priests and bishops. These will be family fathers like other Christians, but specifically devoted to studying the Scriptures, preaching, teaching, and caring about the morals and religion of the members of the community. We have to judge Erasmus's behavior towards the papacy (that has generated misunderstandings in interpretation, most notably with respect Luther's behavior) in this context. As is true of all other priests, the Bishop of Rome should first of all change his habits, starting with the practice of aggressiveness and temporal power. Then he should practice chastity, poverty, and mildness and devote his efforts to banishing illiteracy, above all with regard to Christian philosophy and literature. Indeed, the main activity of a priest must be studying, but (despite the importance of classical culture for young people's education) an adult Christian should not dedicate his/her attention excessively to pagan culture. Actually, Erasmus refuses the Renaissance papacy, with its gorgeous but semi-pagan culture. Even so, unlike Luther, Erasmus does not see the papacy as an irreparable evil. Whenever the early simplicity is recovered, the Bishop of Rome will sit in the assembly of all the other bishops, and it may even happen that he could enjoy, as an act of homage to the seat of Saint Peter, a particular respect and authority inside the Council. What counts most is that the Council is the authority appointed to decide in theological matters. As a matter of fact, 3 hundred and 50 years before the dogma of Papal infallibility (1870), at the moment of the Lutheran crisis, one of the most important problems to be settled was, in fact, who should be the ultimate authority in matters of faith. The most influential theological academies in Europe

(Paris, Louvain, Valladolid), whose professors were almost all members of religious orders, were the places where theological matters were discussed. And the leaders of the Roman church, who were often distant from theological studies and acted as secular princes, were inclined to passively accept the decrees in matter of faith that were issued by theological academies. Moreover, when the task was to judge the theological rectitude of a man or a written work, it was entrusted to the exponents of the academies, who often sat side by side with the bishop in the inquisitorial tribunals, and had the last word about heresy and orthodoxy. Erasmus' hostility towards religious orders originates too from the great influence that they exerted on the destiny of the Christian people, overriding the priests' role as judges, in addition to superseding them as teachers, preachers, and confessors. Furthermore, Erasmus took up an uncompromising position against scholastic theology, theorizing and spreading throughout his life the only form of theology that he considered appropriate to a Christian mind – the theology he called *philosophia Christi*, the philosophy of Christ. Studying Scriptures and Fathers is a complex and demanding activity, because it requires a good knowledge of the sacred languages (Latin, Greek, and Hebrew), above all the Greek of the New Testament, and of a considerable number of other sciences that are useful in moving, as far as possible, close to the heart of God's word, while breaking the hard shell of its archaic and metaphorical form. Whoever dedicates himself to this kind of study, Erasmus says, has no spare time or energy to waste on the quibbles of an academic dialectic. It follows that, when Christian priests decide to concentrate on their authentic work as wise, cultivated and loving guides for their people, then theological questions will be discussed and resolved inside the councils.

On the basis of what has been stated above, the Christian society that Erasmus yearned for appears to have been much simpler than Christian society as it really was in early modern Europe, but, nevertheless, closer to a large portion of European society in the following centuries. Having abolished the distinction between clerics and

laymen and the values of the feudal nobility, in such a renewed society work (whether manual or intellectual) became the most noble activity, and one principle that gradually became central was that all individuals are equal at birth, and that differences between them depend on their capacity to improve their personal gifts.

Impact and Legacy

Erasmus' place in European religious history can nowadays be considered largely debatable. He died in 1536, before the final break between the Roman and evangelical churches. During his life, the institutional exponents of the Church, definable as the academic theologians, repeatedly charged him with heresy, and two official condemnations were delivered by the Universities of Paris and Valladolid. After his death, the Roman Church somehow ratified those sentences, by including all of his works in the Index of forbidden books. At the end of the sixteenth century, the Roman theologian Robert Bellarmine (1542–1621) wrote that Erasmus' writings could not be amended, only burned to ashes. On the other hand, the fact of having disputed with Luther, refused to openly join the Lutheran movement and condemned the schism and its more aggressive expressions, also made him hateful to the Protestant tradition, which accused him of ambiguity and cowardice. It is, in any case, worth observing that the Protestant party never accused him of being a "papist." On the contrary, some of his opinions, after being stigmatized by his Roman critics, especially those that dealt with the divine nature of Jesus Christ and the baptism, were regarded with suspicion even by the reformers who founded institutional churches. In particular, Luther thought that Erasmus' exclusive faith in the central role of the Scriptures in leading to salvation brought him inevitably to theological skepticism and to a denial of dogmas that even Lutherans and (subsequently) Calvinists preserved as the basis of their faith (Asso 2006). Actually, most of the radical Reform movements (such as the Anabaptists and Socinians) and their successors in the seventeenth century (notably the

Arminians) based their doctrines on Erasmus' writings (Bietenholz 2009).

England was probably the place where the legacy of Erasmus was in the best position to develop unimpeded. His writings influenced the English educational system and culture (and even the language, considering that many acquisitions from Latin arrived through Erasmus' writings). Even the history of the Church of England – despite a period of unrest lasting over a century – seems to have acquired a deeply Erasmian aspiration to preserve the traditional form of religion, while undergoing at the same time a deep reformation of the essence of its doctrine.

The influence of Erasmus on the theory and practice of children and young people's education in general has been of primary importance in the Western world. Condemning corporal punishment, the idea that teaching must be the result of a loving relationship between teacher and pupil, the idea that even in this field the technique of persuasion is more effective than obligation or repression, making use of psychology – in other words, counting on a deep knowledge of human nature – in applying this method, the idea that the father of the family must personally take care of his children's education from infancy onwards, all these principles have sent down roots and come to constitute over the long term the backbone of children's education in Europe and North America.

Erasmus' contribution to the development of the good manners has been of no less importance. This aspect of his thought, which has largely been overlooked by the traditional literature, was of crucial importance in transforming European society during the modern age (Elias 1939). In the following centuries, it penetrated the educational programs dedicated to the ruling class, despite Erasmus's deeply antiaristocratic spirit, and above all it contributed to shaping the consciousness of the bourgeoisie in England and the Netherlands, eventually reaching North America. Closely linked with this aspect of Erasmus's thought was the principle that the value of an individual consists of his personal virtues, regardless of the prestige of his/her family tree. Such virtues may be expressed only through the ability

to be a good communicator. Moreover, communication through the *logos*, the capacity to speak and write well, even if the most important ability, loses much of its value if it is not accompanied by physical communication, comprising pleasant looks and gestures. Everyone can achieve access to an adequate knowledge of these means of communication. In its absence, the son of an earl will certainly be inferior to the son of a workman who has found the way to acquire it.

E

A Preliminary Chronological List of Erasmus' Works

(Abbreviations: OW = Original Works; ET = Editions and Translations)

1500

OW

- *Adagiorum collectanea* [ASD II/9; CWE 30].

1503

OW

- *Disputatiuncula de tedio pavore tristitia Iesu* [ASD V/7; CWE 70].
- *Enchiridion militis christiani* (first ed. in *Lucubrationculae*) [ASD V/8, CWE 66].

1504

OW

- *Panegyricus ad Philippum Austriae ducem* [ASD IV/1; CWE 27].

1505

ET

- Lorenzo Valla, *In Latinam Novi Testamenti interpretationem adnotationes*.

1506

ET

- Euripides, *Hecuba et Iphigenia* [ASD I/1].
- Lucianus, *Opuscula ab Erasmo Rot. Et Thoma Moro traducta* [ASD I/1].

1508

OW

- *Adagia* (first ed.) [ASD II/1–8, CWE 31–40].

1511

OW

- *Concio de puero Iesu* [ASD V/7].
- *De ratione studiorum* [ASD I/2, CWE 24].
- *Moriae Encomium*, id est *Stultitiae laus* [ASD IV/3, CWE 27].

ET

- *Missa Sancti Ioannis Chrysostomi ab Erasmo Rot. versa.*

1512

OW

- *De duplici copia verborum ac rerum* [ASD I/6, CWE 24].

ET

- Lucianus, *Complures dialogi*.

1513

OW

- *Adagia* (second ed.) [ASD II/1–8, CWE 31–40].
- *Libellus de constructione octo partium orationis* [ASD I/4].

ET

- Plutarchus, *De tuenda bona valetudine praecepta* [ASD IV/2].

1514

OW

- *Opuscula aliquot (Catonis praecepta; Mimi Publiani; Septem sapientum celebria dicta; Institutum Christiani hominis, carmen pro pueris ab Erasmo compositum).*
- *Parabola sive similia* [ASD I/5; CWE 23].

ET

- Plutarchus, *Opuscula* [ASD IV/2].
- Seneca, *Tragoediae*.

1515

OW

- *Adagia* (3d ed.) [ASD II/1–8, CWE 31–40].
- *Enarratio allegorica in primum psalmum Beatus vir* [ASD V/2, CWE 63].

ET

- Seneca, *Lucubrationes*.

1516

OW

- *Hieronymi Stridonensis Vita* [ASD VIII/1 (forthcoming), CWE 61].
- *Institutio principis christiani* [ASD IV/1, CWE 27].

ET

- Hieronymus Stridonensis, *Epistolae*.
- Isocrates, *De institutione principis* [ASD IV/7].
- *Novum Instrumentum* (1st. ed) [ASD: VI/2 (*Ioh. and Acta*); VI/3 (*Ep. Apost. 1*); VI/4 (*Ep. Apost. 2 and Apoc.*); VI/5–10 (*Annotationes*); CWE 56 (*Ann. on Rom.*), 58 (*Ann. on Gal. and Eph.*)].

1517

OW

- *Adagia* (fourth ed.) [ASD II/1–8, CWE 31–40].
- *Apologia ad J. Fabrum Stapulensem* [ASD IX/3, CWE 83].
- *Epistolae sanequam elegantes*.
- F.A.F., *De obitu Iulii* (editio princeps of *Iulius exclusus e coelis*, never recognised by Erasmus) [ASD I/8, CWE 27].
- *Paraphrasis in Epistolam ad Romanos* [CWE 42].
- *Querela pacis* [ASD IV/2, CWE 27].

ET

- *Epistola Eucherii episcopi Lugdunensis ad Valerianum propinquum de philosophia Christiana*.
- Isocrates, *Paraenesis ad Demonicum*, translated by Rodulphus Agricola.
- Lucianus, *Opuscula*.

1518

OW

- *Adagia* (fifth ed.) [ASD II/1–8, CWE 31–40].
- *Argumenta in omnes epistolas apostolicas nova*.
- *Auctarium selectarum epistolarum*.
- *Declamatiuncula* [ASD IV/7].
- *Enchiridion militis christiani* (second ed.).
- *Encomium artis medicae* [ASD I/4, CWE 29].
- *Encomium matrimonii* [ASD I/5].
- *Ratio verae theologiae*.

ET

- Basilius, *In Esaiam commentariolus*.
- Q. Curtius Rufus, *De rebus gestis Alexandri Magni*.

- *Adagia* (11th ed.) [ASD II/1–8, CWE 31–40].
- *Enarratio psalmi XIV qui est de puritate tabernaculi sive ecclesiae Christianae* [ASD V/2, CWE 65].

ET

- Origenes, *Opera latine ... partim versa, partim recognita*.

List of Allen's AppendicesVol. X:Vol. I:

1. The authenticity of the *Compendium vitae*.
2. Erasmus' early life.
3. The letters to Servatius, Francis and Sasboud.
4. The correspondence with Cornelius Gerard.
5. Erasmus with the bishop of Cambray.
6. Erasmus at Cambridge in 1506.
7. The principal editions of Erasmus' epistolae.
8. The Deventer Letter-book.
9. The Gouda manuscripts.
10. Miscellaneous letters.

Vol. II:

11. Prefaces.

Vol. III:

12. The *Epistolae selectae per Barlandum*, 1520.
13. The Copenhagen manuscript.

Vol. IV:

14. Eppendorff's copy of the *Epistolae ad diversos*.
15. The Heine collection.

Vol. V:

16. A dubious letter of Erasmus.

Vol. VI:

17. The Nève collection.
18. Letters of John Vergara and others.
19. Erasmus' first will.

Vol. VII:

20. Books ordered by Erasmus Basilea 1525?

Vol. VIII:

21. The Olah Codex.

22. The *Compendium rhetorices*.
23. The donation to Goclenius.

Erculiani, Camilla

Born: 1540s, Padua

Died: 1585?, Padua?

Eleonora Carinci

Università Ca' Foscari, Venezia, Venice, Italy

Abstract

Camilla Gregghetti Erculiani was apothecary with her husband at the *spezieria* “Alle tre stelle” in Padua. Thanks to her connections with the Paduan network of scholars and students of medicine and philosophy, and with Polish scholars studying in Padua, in 1584 she published her *Letters on Natural Philosophy*, printed in Krakow. Shortly after the publication of her work, she was accused of heresy by the Paduan Inquisition for some of the ideas expressed in her book, which aimed to demonstrate the natural cause of the biblical Flood.

Alternate Names

Herculiana Gregetta, Camilla; Gregghetti Erculiani, Camilla; Gregeta Erculiani, Camilla

Biography

Camilla Erculiani was the only woman who published her theories on natural philosophy in sixteenth-century Italy. Probably born in early 1540s, she was the daughter of the wealthy Paduan merchant and apothecary Andrea Gregghetti. In the early 1560s, she had married the apothecary Alvise Stella, and after his death, she married the apothecary Giacomo Erculiani in 1573. She had a child from the first marriage and five children

from the second. She worked with her husband Giacomo at the *spezieria* “Alle Tre Stelle” (“At the Three Stars”) in Padua, previously owned by Stella, and in 1584 she published her first and only book, *Lettere di Philosophia naturale* (“Letters on Natural Philosophy”). In 1585 she was interrogated by the Inquisitor of Padua for the content of her *Lettere*. Her book was printed in Krakow, probably thanks to Polish students and scholars at the University of Padua she met in her pharmacy.

It is likely that most of Erculiani’s philosophical knowledge was due to her job and to the network of students, physicians, and natural philosophers who were connected with the University of Padua and frequented her *spezieria*. She presumably read books for apothecaries and works by Galen, as well as works on natural philosophy and meteorology in the vernacular, addressed to a larger nonacademic audience, such as those by Alessandro Piccolomini; she had some knowledge of astronomy and astrology, and she might have learned some Latin; she certainly read Sebastiano Erizzo’s translations into Italian of Plato’s dialogues, and she had epistolary exchanges with Erizzo himself (Vanhaelen 2016); she also used the Bible to demonstrate her theories.

The *Lettere di filosofia naturale* include four letters, three composed by Erculiani, and one, presumably, by her correspondent Georges Guarnier, a Burgundian physician graduated in Padua in 1577. In her Letters Erculiani aimed to demonstrate her theory of the natural origins of the Universal Flood, of the composition of men, on the nature of the rainbow, and on the role of planets on all of this. Her “scientific” and, in some regards, materialistic theories were based on, or inspired by, Galenic, Aristotelian and Platonic thought. The book is framed by several paratextual devices, including two poems, a dedicatory letter to the Queen of Poland, and a note to the readers, in which Erculiani defends her ability as a woman to write about philosophy. Erculiani expresses her thoughts from an explicitly feminine point of view and inserts her text into the vibrant contemporary debate by and about women over their role in Italian culture.

Erculiani wrote in the particularly favourable cultural context of late sixteenth-century Padua, where the scientific debate was open and active. Throughout her work she positioned herself on equal footing with contemporary male philosophers and vied forcefully with their theories, often contradicting them, and claiming to express her own opinions – sometimes quite original – based on her experience and on her own interpretation of various authors and theories. What emerges from her writings is a woman who aims to express her opinion discussing with other philosophers and encouraging other women to do the same.

In spite of the limited number of copies printed, Erculiani's work did not pass quietly and unnoticed. A *consilium* published by the lawyer Jacopo Menochio recounts how Camilla Erculiani was accused of heresy by the Paduan Inquisition for the ideas expressed in her book (Carinci 2013). The *consilium* reports in detail Erculiani's statements which were considered against the Catholic belief, first of all her main challenging and quite materialist theory about the natural cause of the Universal Flood, which denied that the Deluge was a divine punishment of men's sins, and argued that it took place for natural causes, related to the equilibrium of elements in the world. Menochio's defense includes the fact that Erculiani claimed to speak philosophically and not theologically – seeming to appeal to the so-called double truth theory – and that as a woman, like ignorant people and children, she was more excusable. The outcome of the trial is unknown, but certainly it blocked Erculiani's ambitions: her further works "On the sin" and "On the soul," mentioned in her letters and now lost, were never published, and even if she did not die soon after, she disappeared from the Paduan cultural panorama.

Ethics, Renaissance

David A. Lines

Italian Studies, School of Modern Languages and
Cultures, University of Warwick, Coventry, UK

Abstract

This entry begins by outlining some of the main medieval views on the purview of ethics and how this discipline relates to the other branches of moral philosophy or other fields. These views, as well as the question of the compatibility between pagan and Christian ethics, were highly influential on later thinkers. The second section examines various features of Renaissance ethics, such as the sources on which it drew, the contexts in which it was debated, the approach taken to philosophical and religious boundaries, the forms through which ethics was discussed, and the themes that were examined. It also covers five different historiographical approaches to Renaissance ethics. Ethics emerges as a highly interesting subject, in part because it was claimed by both humanists and scholastics, allowing one to gain insights into both approaches. Although the rise of early modern philosophy questioned many of the assumptions of Renaissance ethics, various solutions accepted in the period continued to attract both professional philosophers and other cultured individuals before reemerging in the past few decades, thanks in part to virtue ethics.

Heritage and Rupture with the Tradition

Questions about ethics and moral philosophy more broadly had been central to discussions in ancient thought, including the writings of Plato and Aristotle and the Epicurean and Stoic schools. To various extents these had left their mark on Roman writers such as Cicero, Seneca, and Boethius, whose works were much better known in the Latin Middle Ages than their Greek

counterparts and whose thought often became assimilated with or joined to Christian views about virtue. A telling example is the seven virtues, which from early on comprised the four cardinal virtues proclaimed by various pagan writers (prudence, justice, temperance, and courage or fortitude) and the three theological virtues (faith, hope, and love). Discussions about virtues (and vices) were commonplace (Bejczy 2011), but it was not until the translation into Latin of Aristotle's *Nicomachean Ethics* and the Greek commentaries on that work (completed by Robert Grosseteste c. 1250) that a more philosophically grounded understanding of ethics developed in the Latin West (Lines 2002a, 111–157). Many of the most influential thinkers commented on Aristotle's *Ethics*, including Albertus Magnus (1200–1280), Thomas Aquinas (1225–1274), Giles of Rome (1245–1316), Walter Burley (1275–1346), Gerard of Odo (1290–1349), John Buridan († after 1358), and Albert of Saxony († 1390). Also strongly influenced by Aristotelian thought were John Duns Scotus (1265/1266–1308) and William of Ockham (c. 1288–1347). These writers were also aware of and responded to the views offered by the ancient Greek commentators, by the Byzantine commentator Eustratius of Nicaea (†1120), and by the middle commentary on the *Ethics* by the Arab philosopher Averroes (Ibn Rushd, 1126–1198). A hotly debated topic was how ethics as a field of enquiry should be understood, something that was often resolved on the basis of its subject, its object, its method, its end, and various other considerations (often discussed in the commentaries' prologues). Two main views developed (for what follows, see Lines 2002a, 123–129, 143–149; Kraye 1988, 303–306).

The first takes as its basis the views of Eustratius of Nicaea and Thomas Aquinas. Eustratius starts his discussion from the aim of ethics (i.e., individual betterment); the main function of ethics is to help people live faultlessly, ruling their passions and living by reason. The proper sphere of ethics is earthly action, but there is nonetheless a strong connection with the contemplative life of impassibility that unites

the individual soul with God. This view sees moral philosophy as a tripartite subject, which takes into consideration the individual (ethics), the family (oeconomics), and the state (politics). The connections between these three branches are not always clear, given Eustratius's insistence on individual perfection. Thomas builds on Eustratius's view but gives a more prominent role to action; indeed, the proper subject of moral philosophy as a whole is human actions, inasmuch as they are related to one another and to their end. Thomas is then able to argue that ethics concerns the actions of the individual, whereas economics and politics concern the actions of increasingly broader groups (i.e., the family and the state, respectively). Within this scheme, the highest place is accorded to politics, since it considers the largest grouping. Nonetheless, ethics remains of fundamental importance, as it considers actions in view of individual betterment and happiness (*eudaimonia*), something that achieves a religious coloring when it is translated, as it sometimes is, by *beatitudo* (blessedness) instead of *felicitas*.

A second, influential perspective was offered by the writings of Averroes, Albertus Magnus, Gerard of Odo, and John Buridan. This view, which is particularly clear in Albertus Magnus, again sees *felicitas* as playing an important role as the end of ethics. Nonetheless, the subject matter of ethics is considered to be the *disciplina hominis* as opposed to the *disciplina unius hominis*. In other words, it is not the well-being of the individual that is under consideration here, but rather that of mankind in general. Ethics is thus seen as the branch of moral philosophy that provides the theoretical principles of virtue; these are then applied by the other branches (oeconomics and politics) in order to make people good. In this system, ethics is superior to the other two branches inasmuch as it is a theoretical subject from which the other two derive their principles. Buridan follows this line when he insists that the subject of ethics is man inasmuch as he is free and capable of attaining to happiness. Its concern is therefore not how specific individuals should act, but how people in general should behave in particular situations.

Both viewpoints outlined above agree that ethics is not a science *sensu stricto*, since it deals with the realm of the contingent and variable. They also insist that discussions of ethics are not for the sake of theoretical speculation, but of practice and action. Nonetheless, they involve notable differences of emphasis. Albertus Magnus, for instance, underlines that ethics does not derive its principles from metaphysics, but from considerations internal to itself. He explicitly confines its remit to the earthly and the civic, accusing of impropriety commentators who take Aristotle's discussion of the *summum bonum* as an excuse for discussing heavenly happiness. Thomas Aquinas does not discuss the method of ethics at length, but he does follow Albertus in applying to it Galen's distinctions between the three orders of enquiry (*resolutivus*, *compositivus*, *definitivus*). Ethics follows the second of these, or the synthetic method (which proceeds from knowledge of the end and moves toward first principles), rather than the first, or the analytic method (which is proper to the theoretical sciences and moves in the opposite direction). He also sees similarities between the method of ethics and that of dialectic, rhetoric, and poetics. Buridan's views are also of considerable interest. Of the medieval commentators, he comes closest to seeing ethics as a theoretical science (although not on the same order as, say, natural philosophy). At the same time, like Averroes and others, he assigns a significant role to what he calls a *logica moralis* or *dialectica moralis*. Buridan says this particular kind of logic can be found in Aristotle's *Rhetoric* and *Poetics*. He views this as a counterpart to the method used in the speculative sciences; yet it is not a method of investigation, but of teaching and expression: its function is to dispose the appetite not to resist the intellect as it indicates the path of virtue.

All of the points just mentioned (including the practical purpose of ethics, its status as an intermediate discipline between the theoretical and the applied, its earthly focus, its close relationship with rhetoric and poetics, and the question of how it fits within the methods outlined by Galen) are seized upon and further developed in Renaissance discussions and debates about ethics. For

instance, nearly all Renaissance interpreters (with the exception of Felice Accoramboni) agree that ethics is not a science. Even Petrarch's view (in *De sui ipsius ac multorum ignorantia*) that moral philosophy is only as effective as it is eloquent draws on this tradition.

A particular issue worth noting is the relationship of Christian and pagan ethics. Partly influenced by Eustratius, who offers an interpretation of Aristotle's *Ethics* strongly colored by Christianity, Thomas and other commentators argue for the compatibility between the two. Yet the preferred kind of pagan ethics was that of Aristotle, not the unsystematic and often poorly known (when not clearly problematic) accounts of Plato, Stoics, or Epicureans. The sections on ethics in Thomas' *Summa theologiae* owe a clear and heavy debt to Aristotelian moral philosophy. The Dominican friar's discussion of prudence, for instance, concerns not only how to define it and what its parts are, but whether it is present in sinners and in those enjoying God's grace (*ST*, IIa IIae, q. 47, a. 13–14). Likewise, Thomas explores both moral virtues and vices by bringing to bear Christian considerations as well as pagan authorities. Thomas' synthesis, though not unique, enjoyed a considerable *fortuna*, both as a model and in its specific conclusions (Gauthier 1947–48; Lines 2005a), even though some fifteenth-century Dominicans such as Girolamo Savonarola and Ludovico Valenza preferred to decouple philosophy and theology (Lines 2006). In Italy the theological orientation of moral philosophy was less strong than elsewhere in Europe, particularly in the university context, where theology was often absent. But we shall see that influential commentators in the fifteenth and sixteenth centuries contributed even there to building a new synthesis between Christian and pagan ethics.

Innovative and Original Aspects

Despite obvious points of continuity with the late Middle Ages, Renaissance discussions of ethics also departed from previous treatments in various ways. This section examines the sources,

contexts, approaches, forms of expression, and themes of Renaissance ethics. It concludes by considering how Renaissance ethics has been approached by various scholars.

Sources. Most late-medieval and Renaissance discussions of ethics took their starting point from the works of Aristotle (Kraye 1988, 325–348; Bianchi 2013), who had written the *Nicomachean Ethics* and (or so it was thought) both the *Eudemian Ethics* and the *Magna moralia*. Of these works, the most important was the *Nicomachean Ethics*, which was taught as the standard textbook in courses of moral philosophy all over Europe. This work provides a fairly ordered discussion, starting with happiness and its connection to virtue (Bk. I), and then explaining how virtue is acquired (Bk. II), the identity of the specific moral virtues, including justice (Bks. III–V), the intellectual virtues and the role of prudence (Bk. VI), the problem of the passions and *akrasia* (Bk. VII), the importance of friendship (Bks. VIII–IX), and the choice between the active and contemplative lives (Bk. X). As a result, the *Ethics* was translated, edited, or commented on by a broad range of figures such as (in Italy) Leonardo Bruni, Donato Acciaiola, Giovanni Pontano, Giovanni Bernardo Feliciano, Bernardo Segni, Pier Vettori, Alessandro and Francesco Piccolomini and (outside of Italy) by Jacques Lefèvre d'Étaples, Philipp Melanchthon, Theodor Zwinger, Joachim Périon, John Case, and many others (Kraye 1988).

In addition to Aristotle, late-medieval and Renaissance ethics drew increasingly on numerous other classical sources, including Plato (and Plato commentaries), the Stoics, and Academic Sceptics (Kraye 1988, 2007, 2008; Poppi 1997b; Lines and Kraye 2013). Works such as Cicero's *Tusculan Disputations* and the writings of the Stoics Seneca and Epictetus (in the seventeenth century, also Marcus Aurelius) were particularly influential. At the end of the sixteenth century, the Neo-Stoic project of Justus Lipsius was culturally fundamental to help heal the religious divisions that had descended into violence and war (Papy 2017). Ficino's version of Plato's doctrine of love had literary and philosophical repercussions well beyond the fifteenth and sixteenth centuries

(Kraye 1994; Ebbersmeyer 2002). Epicurean writings were of comparatively little moment until around 1600 (Wilson 2008), although thinkers such as Lorenzo Valla and Erasmus were aware of them and Christianized them (Kraye 2007, 102–106; Gambino Longo 2007; Palmer 2014). Many of these currents (some of them revitalized by the appearance of new sources) attracted eclectic, rather than wholehearted, devotion, to the extent that many thinkers cannot be described as belonging to a single ethical school (Kristeller 1985, 180–183; Lines and Kraye 2013). Strategies varied as to how to combine various sources and which to include (Schmitt 1983, ch. 4; Kraye 1993, 45–48; Kraye 2002a; Cuttini 2005).

One should not, however, forget the influence on Renaissance ethical discussions of Christian thought, which despite some older studies (e.g., Trinkaus 1970) has not been sufficiently explored (Bianchi 2011). Indeed, the operation of evaluating, reconciling, or sifting the various sources available often took place with Christian considerations in mind (Kraye 1988; Kraye 2004). Thus, the fifteenth century saw attempts to censor or soften passages in Plato's *Republic* on the community of women, since these ran counter to Christian morality (Hankins 1991). Luther raised strong objections on theological grounds to Aristotle's theory of virtue (which has no place for grace). And Epicureanism was usually depicted as a doctrine of lustful abandonment to the senses, even by those who knew better; it was thus fended off until the seventeenth century, when attempts to reinterpret it made it more palatable. Even Stoicism, close in some respects to certain Christian tenets, could be held at arm's length, particularly for its rejection of clemency and other Christian virtues, as is clear from Francesco Piccolomini's *Universa philosophia de moribus* (1583) among other works (Kraye 2002a). What is also notable, however, is Piccolomini's deployment of Plato's philosophy as a confirmation of Christian viewpoints and a shield from other potentially unorthodox doctrines. This strategy already had its roots in the commentary by Eustratius, but gained considerable ground with the immensely influential *Ethics*

commentary of Donato Acciaiuoli, first printed in 1478 on the basis of the Florentine lectures (1457–58) of the Byzantine émigré Johannes Argyropoulos (Bianchi 2003). This approach was only strengthened with the recovery and publication of Plato's complete works in Marsilio Ficino's Latin translation (1484). The Aristotle commentaries of Jacques Lefèvre d'Étaples, written in Paris at the end of the fifteenth century, are already highly indicative of the new trend (Kraye 2002b, 104–105; Lines 2007). Another significant example is the *Epitome in X libros ethicorum* by the Dominican Crisostomo Javelli, an opponent of Pietro Pomponazzi's controversial views on the soul, who tamed Aristotle through Plato's works and Christian doctrine. Probably written in the 1530s (Lines 2002a, 499), Javelli's work observed the directives of the papal bull *Apostolici regiminis* (1513) to combat potentially heretical notions through Christian teachings. Also instructive in this sense is the *Institutione dell'huomo nato nobile e in città libera* by Alessandro Piccolomini (Cestelli Guidi 1998); this work (first ed., 1542) had a deep Christian hue and promised to treat practical philosophy both "Peripatetically and Platonically." A strong Catholic orientation can also be seen in four other vernacular works written during the Counter-Reformation by Felice Figliucci, Galeazzo Florimonte, Giulio Landi, and Antonio Scaino (Bianchi 2013, 155–156).

Contexts of ethics. The study of ethics (as opposed to the imparting of moral precepts via the works of classical or Christian writers) took place in many parallel contexts (Lines 2013). The universities, for instance, particularly outside Italy, considered moral philosophy an essential part of the Arts curriculum: it was early on a mandatory subject and taught by senior professors; many lecture manuscripts and disputations survive, often indicating close ties with theological concerns (Lines 2005b; Darge et al. 2010). But Italian universities too gave it an increasingly prominent place and served as a context for discussion of a variety of ethical problems, including how moral education should take place (Lines 2002a). In Italy, however, ethics for a long time lacked a clear place in the curricular ladder; it

was assigned to junior professors and was taught on feast days as an optional (rather than as a required) course. This made for considerable fluidity with other subjects. It was not until the sixteenth century that it came to be more permanently associated with rhetoric (Pisa, Padua) or philosophy (Bologna) and was taught more consistently. The Jesuits too taught moral philosophy (and especially ethics) within their full-fledged colleges. Some analysis of its features has taken place, particularly for the Collegio Romano (Lines 2002, 348–383), but much remains to be done. We are also not well informed about ethics teaching in the *studia* of the mendicant religious orders, which provided training in philosophy and theology to their most promising members (for the Franciscans, see Roest 2000).

Ethical problems were also discussed in numerous informal contexts. Humanist “academies” – such as those of Marsilio Ficino in Florence, Aldo Manuzio in Venice, and later on the *Orti Oricellari* in Florence – also paid attention (although not exclusively) to ethics, often in connection with works of literature, history, or philosophy. Thus, the circle around Giovanni Pontano in Naples must have discussed ethics, on which Pontano wrote numerous works (Roick 2017). Likewise, the many academies that sprang up in sixteenth-century Italy often gave a privileged place to literature, but on several occasions (particularly in the Accademia degli Infiammati in Padua or the Accademia Fiorentina), literary works were examined from a moral and even philosophical perspective. A famous case is that of Benedetto Varchi, who lectured on the *Ethics* in the Accademia degli Infiammati in Padua and in Florence treated moral subjects while ostensibly lecturing on literary authors such as Dante and Petrarch (Andreoni 2012). Ethical debates also took place in the courts of kings and princes, thus providing a credible setting for works such as Baldassar Castiglione’s *Il libro del cortegiano*, whose dialogues are imagined as taking place in the court of Urbino. For informal contexts the evidence tends to be scanty, although quite a bit survives for the court of King Henri III of France (Lines 2013, 67–73) and we are fairly well informed about the

philosophical debates at the court of Queen Marguerite de Valois, where – among others – Scipion Dupleix was active (Giacomotto Charra 2015). It may well be that the topics discussed in informal contexts, and the ways in which these were approached, had a different hue from those that took place in more formal ones (Quondam 2010; Mack 2013), although they were probably closer than is usually imagined.

A fundamental consideration when thinking about contexts is the difference between Catholic and Protestant lands (and, within Protestant territories, the difference between Lutheranism and other confessions; for the following see Saarinen 2005, 2013). Luther’s emphasis on the “three orders” of church, household, and the state stressed the communitarian, rather than the individual, dimension of ethics. Luther and Philipp Melancthon were also initially somewhat more favorable toward the Stoic ethical tradition than the Aristotelian one (which was seen by some as being close to Pelagianism), although several later Lutherans, including Joachim Camerarius, wrote important commentaries on the *Ethics*. A stronger emphasis on ethics is found among the Calvinists, who regarded individual *ethica Christiana* as providing evidence for belonging to the company of the elect. The close relationship of some Protestants with both Stoicism and Aristotelianism is made clear in Lambert Daneau’s *Ethices Christianae libri tres* (1577), but Calvinists were also critical of certain Stoic notions, particularly the ideal of *apatheia* (impassibility). The Catholic tradition continued, to a considerable extent, to exploit Aristotle’s writings (reconciling them when possible with Platonic and other elements), but also gave new attention, particularly in the wake of the Council of Trent (1545–1563), to developing the field of moral theology and to debating the relationship between nature and grace. Eventually Tridentine reforms also had an effect on university ethics, although the process was slower than sometimes thought (cf. Schmitt 1979).

Approaches. One characteristic these diverse ethical works had in common was that they became increasingly religious in orientation. Indeed, contrary to the views of some historians,

at least from the second half of the fifteenth century, most Renaissance thinkers underlined the compatibility of pagan and Christian ethics (See ► “[Happiness, Renaissance Concept of](#)”). Various models of concordism were embraced (here it is not possible to consider their possible relationship to late-medieval ones, outlined in Solère 2002). Melancthon kept philosophy and theology separate, but viewed Aristotelian ethics as an important first step for appreciating the truths of the Gospel (Meerhoff 2007). Many Italian interpreters sought to accommodate all of the known sources with each other, under the banner of Christianity (Kraye 1988; Bianchi 2011). Nonetheless, this characterization should be seen as a trend rather than a rule. Notable exceptions include the Florentine Pier Vettori, whose commentary on the *Nicomachean Ethics* (1584) is almost exclusively a philological enterprise (Lines 2002, 238–246), or the Bolognese professor Claudio Betti, whose lectures (1570s) used the *Ethics* as a text through which to teach logic (Lines 2002, 310–324). Throughout Europe, the text of the *Ethics* was approached in markedly different ways and for different purposes (Kraye 2002b).

Forms of expression. Ethical discussions during the Renaissance often continued the earlier practice of examining particular points in the course of a commentary on a canonical text (e.g., Aristotle’s *Ethics*, Cicero’s *Tusculan Disputations*), whether or not this was associated with the classroom. Nonetheless, many other forms and genres were also in use. The medieval practice of collecting moral sayings of antiquity under specific moral headings (such as “virtue” or “friendship”) illustrated by the *Compendium moralium notabilium* of Geremia da Montagnone (before 1310) continued within humanism, where it was brought to new heights in the tradition of the commonplace book (Moss 2013). Likewise, biographical accounts (of saints, lay people or even pagans) could provide examples of virtuous living that deserved to be followed (Frazier 2013). Sermons, plays, and poems such as Edmund Spenser’s *The Faerie Queen* (1590–1596) continued, as in earlier times, to be effective vehicles of ethical teaching. But the Renaissance also saw an

emphasis on new or less usual genres, represented by Desiderius Erasmus’s *Adagia*, Michel de Montaigne’s *Essais*, the sayings and letters contained in Antonio de Guevara’s *Golden Book of Marcus Aurelius*, and the dialogue form of Castiglione’s *Il libro del cortegiano* (Mack 2013). In addition to these genres, particularly relevant to informal settings of ethical discussion are the academies’ *lezioni* on literary authors (see above) and the increasing number of treatises, paraphrases, philological analyses, philosophical textbooks, or dichotomous tables outlining the relevant moral works of Aristotle (Lines 2002a, 223–246). All of these genres allowed authors to depart from the linear nature of the commentary tradition, giving them the freedom to rearrange canonical works and elaborate their own (often less systematic) ethical vision (Bianchi 2013, 156–160). The Jesuit development of textbooks dedicated to philosophy (sometimes including ethics) may seem to pull in the opposite direction, but in fact the systematic treatment they reserved for philosophical topics meant they enjoyed more freedom to choose which aspects to emphasize. As an example, the *Ethics* textbook produced by the Coimbra Jesuits (first ed., 1573) proceeds by a series of disputations, each of which contains several questions relating to ethics, but abandoning altogether the attempt to correlate these to a direct and linear reading of the *Ethics*, also because several other sources are taken into account (Schmitt 1988; Leinkauf 2017, I, 780–782).

Language represents another important dimension of the variety of Renaissance forms of moral discourse. Greek editions of the relevant texts became increasingly available from the end of the fifteenth century, but almost all Renaissance discussions of ethics took place either in Latin or in the vernacular. Latin had a particularly prominent place in schools and universities, as well as in humanist circles. Throughout the period it remained fundamental partly because the interpretation of Aristotle’s *Ethics* was based on Latin translations dating from the thirteenth century, updated or supplanted by fresh efforts in the fifteenth and sixteenth centuries. (The most influential translations in the Quattrocento were penned

by Leonardo Bruni and Johannes Argyropoulos.) It is not surprising that most learned works on the *Ethics* and moral philosophy more generally were written in Latin (listings in Lohr 1988, *passim*; Lines 2002a, Appendix C; Risse 1998 for printed works in all languages). But the vernacular was also gaining ground (Bianchi 2009; Lines 2015a). Especially in Italy, early-fourteenth-century works of vernacular philosophy by Brunetto Latini and Taddeo Alderotti were followed (in the fifteenth century, and even more frequently after c. 1540) by numerous translations, commentaries, dialogues, treatises, and other works in Italian (Lines and Refini 2015; Bianchi et al. 2016; Cotugno and Lines 2016). Again, greatly relevant in this context is Alessandro Piccolomini's *Institutione* (1542; rev. ed., 1560), dedicated originally to Laudomia Forteguerri and reflecting the eclectic and religious slant of many similar works in Latin (Cestelli Guidi 1998). It was followed by Bernardo Segni's substantial translation of and commentary on Aristotle's *Ethics* (1550), a project that emerged from his activities within the Florentine Academy (Lines 2013). Even university professors such as Francesco Piccolomini felt the draw of the vernacular; in later years he produced an Italian compendium of his massive *Universa philosophia de moribus* (1583) for the infant Tuscan prince (Lines 2015b). The vernacular was used for both original and interpretive works of all philosophical schools, not only in Italy but across Europe (Le Blanc and Simonutti 2015; Lines and Puliafito 2019).

Themes. Both Latin and vernacular discussions of ethics gave attention to a shifting constellation of problems. The following are selected examples (cf. the more comprehensive listings in Kristeller 1985, 173–179; Kraye 1988; Mack 2013, 190–191): happiness (Poppi 2013); the active and contemplative lives (Vickers 1985; Poppi 1997c); the connection between happiness, virtue, and external circumstances; the application of the “golden mean”; the importance of specific virtues, such as magnificence and justice, friendship (Langer 1994 and Langer 1999; Sère 2007), and heroic virtue (Saarinen 1990); honor (Bianchi 2000); the applicability of Aristotle's virtues to

both rulers and subjects (Langer 2013); the compatibility of classical and Christian virtues (Kraye 2004; Lines 2006); the interconnectedness and location of the moral virtues; the difference(s) between moral and intellectual virtues; the freedom of the will (Poppi 1988; Knebel 2000); the role of the passions (Casini 2002; King 2002; Knuuttila 2012) and of pleasure (Boulègue and Lévy 2007); *akrasia* or weakness of the will (Saarinen 2011); the respective roles of habituation, education, law, and grace in the acquisition of virtue (Herdt 2008); ethics as science or art (Ebbersmeyer and Kessler 2007); issues in moral education (Lines 2002a); the debate as to whether Plato or Aristotle was the best guide for ethics (Poppi 1997a); and the relationship of ethics to politics (Scattola 2003).

A particularly significant debate developed in Padua around the middle of the sixteenth century on the method and order of ethics (Lines 2002b; Cuttini 2014). The main protagonists were two professors of philosophy, Jacopo Zabarella and Francesco Piccolomini, who especially differed on how ethics should be taught and presented: should one begin with the subject's end (happiness), as Zabarella maintained, or consider this goal only at the very end, as Piccolomini thought? Although these positions were not altogether original with Zabarella and Piccolomini, they were part of a broader controversy at the time on whether the arts and sciences should be taught differently, and on the nature of ethics (art or science?) and its relative importance vis-à-vis politics. These were issues of great moment, which had echoes throughout Europe until the seventeenth century, particularly in German-speaking territories.

The attention to these various themes was often tied to historical circumstances. Aristotle's understanding of friendship, for instance, became of particular interest to Savonarola in the late fifteenth century (Lines 2006), but was problematic for Protestant Reformers who considered its application to man's relationship with God. Likewise, the Stagirate's views on the acquisition of virtue through habituation seemed to them to give too little space to the workings of grace. Fifteenth-century humanists who wished to exalt the active

life were exercised by Aristotle's stated preference (or so it seemed) for the contemplative life in the *Ethics*, Bk. X. So they seized on virtues such as magnificence and were happy to follow this as an ideal for themselves and their rulers. Honor became an issue of particular social relevance in sixteenth-century Spain and Italy. Ruling one's passions surged in importance with the violence of the Wars of Religion and the Thirty Years' War.

The problem of a "Renaissance ethics." The historical context and shifts in audience and language led, as discussed above, to emphasizing and developing various themes in ethics. But did the Renaissance produce an ethics recognizably different from what preceded or followed it? One way of addressing this point might be to ask whether the Renaissance witnessed a "morality of obedience" or a "morality of self-governance." Given that the latter did not emerge, at least in a self-conscious way, until the eighteenth century (Schneewind 1998), one might wonder about the existence of a "Renaissance ethics," in the sense of an identifiable body of moral thought that can be clearly differentiated especially from what preceded it.

Generally speaking, scholars have addressed the difficulty in one of four different ways; the first two of these emphasize discontinuity with the medieval tradition, whereas the other two stress continuity. For Eugenio Garin and his followers, humanism was a philosophical school that centered its attention on mankind and its potential and autonomy; thus, ethics stood at its core to the exclusion of logical, metaphysical, and natural-philosophical concerns (Garin 1994). In this view, religious and theological considerations play an extremely limited role: humanists are often seen as critics of religious institutions and dogmas, who oriented their ethics instead to the active life and to the good of the city or wider community (i.e., to 'civic humanism'; Baron 1955). Close to this position is that of Eckhard Kessler, for whom the humanists' exaltation of rhetoric changed the purpose and subject matter of ethics, leading them to shy away from questions about what was universally valid and to focus instead on the sphere of the individual and the probable (Kessler 2013, 108–111; also

Ebbesmeryer 2010). In this view, humanists traded the arid discussions of the scholastics for much more practical and personal questions. Paul Oskar Kristeller offered a very different perspective: his emphasis on humanism as a cultural and educational movement dedicated to the *studia humanitatis* (Kristeller 1956) placed ethics among the historical and literary disciplines and denied its nature, for the humanists, as a philosophical subject. At the same time, he accorded religion a strong role in humanist thought (Kristeller 1965, 1985) and saw the differences between scholastics and humanists largely as a matter of professional rivalry rather than substance. Followers of Kristeller accordingly deny that humanists shared a common ideology or philosophical program; they often assume that they were uninterested in debating philosophically meaningful questions, even in ethics. Finally, Jill Kraye has refined Kristeller's position and sees Renaissance humanists and scholastics as engaging in a dialogue about a common set of ethical issues; although they tended to treat these in and through varying perspectives, sources, approaches, and genres, there was much that linked Renaissance with medieval discussions (Kraye 1988, 2003). In Kraye's view, the difference between Renaissance and earlier ethical treatments lies therefore more in style, approach, and sources than in specific philosophical conclusions, although she does see a particular novelty in Michel de Montaigne's view of "himself in all his individuality as the central subject of moral philosophy" (Kraye 1988, 316; Kristeller 1985, 182–183). Kraye has especially focused on Renaissance Aristotelianism and Stoicism.

A proposal recently advanced by Thomas Leinkauf is to see humanist ethics in the light of discussions about the self: in this view, self-knowledge is inextricably linked to self-realization and self-expression. It is this focus on the self that leads to understanding how ethics is tied to the good, to virtue, to the will, to freedom, and to society (Leinkauf 2017, I, 629–778). Yet one should not equate this sense of the self with an individualistic understanding of ethics, according to modern parlance. Nor should one see this emphasis as implying a process of secularization

in ethics (Leinkauf 2017, I, 613–614, 618–622). It does, however, lead to severing links between ethics and metaphysics and to focusing instead on the practical world of action and human society (Leinkauf 2017, I, 623–628). Leinkauf suggests that ethical topics debated since the high Middle Ages received a new context thanks to four “irritations” (nominalism and the “linguistic turn,” the Black Death, the exploration of the new world and the questioning of the geocentric model, and the Protestant and Catholic Reformations; Leinkauf 2017, I, 28–113). This rich analysis deserves close study and verification.

While humanist ethics is a growing area of scholarship (e.g., Kircher 2012; Roick 2017), comparatively less attention has gone to the development of scholastic ethics in the Renaissance (but see Kraye 1988, Pink 2005, Lines 2007b, Edelheit 2014, Leinkauf 2017, I, 778–795). What is clear from recent studies is that, like Aristotelianism more generally (Schmitt 1983), discussions about moral philosophy in universities and schools of the religious orders continued to be lively, diverse, receptive toward outside cultural developments, and influential. Enriched by humanist expertise in Greek and new translations, many interpreters across Europe turned to new renderings for their lectures on core texts. Their views on various points, such as the active/contemplative lives, could be colored by humanist discussions. In addition to the Lutheran understanding of the relationship of ethics to the gospel (see above), new perspectives were offered by the School of Salamanca on natural law (Scattola 1999) or by various others on points such as fate, freedom, and God’s power (Knebel 2000; Leinkauf 2017, I, 659–691).

A comprehensive understanding of Renaissance ethics has been especially hampered by four factors: the assumption that only humanists were interested in ethics; a narrow focus on specific languages, national contexts, genres, or chronological periods; the challenge of analyzing countless (often unexciting) commentaries, treatises, and other works; and the relatively scarcity of modern editions, whether in the original or in translation. The most important collections are Kraye 1997 and Ebbersmeyer et al. 2007.

Impact and Legacy

With the rise of early modern philosophy, the earlier consensus concerning the centrality of ancient writings came under attack, in moral philosophy as in other fields. Nonetheless, Aristotle’s works and ideas continued to be taught in many universities and religious colleges until the end of the seventeenth century or even beyond (Darge et al. 2010; for France, see Brockliss 1987). Specific notions that had a strong presence in Renaissance ethics maintained some currency well into the early modern period (for instance, the ideas of Platonic love, Stoic fortitude, or Aristotelian *mediocritas* continued to be familiar themes in popular works; Kraye 1998). Early modern philosophers could hardly turn their backs on the past entirely, and scholars have seen continuities (though of different kinds) between Renaissance viewpoints and the philosophy of Spinoza (Kristeller 1985, 184) and even the moral thought of Thomas Hobbes (Boonin-Vail 1994; Paganini 2016). Despite the rise of utilitarian and other theories of ethics, older ethical perspectives continued to be known through the literature and art that they informed. More recently, a new interest in virtue theory has led scholars and philosophers to consider medieval and Renaissance ethical thought afresh (e.g., MacIntyre 2007); surveys all-too-often continue to skip from Thomas Aquinas to Descartes and his contemporaries, but a younger generation of scholars may well manage to provide what is currently missing: a compelling book-length sketch of ethical developments in the Renaissance, across Europe and across languages. A welcome move in this direction in Kraye and Stone (2000).

Euclid: Reception in the Renaissance

Jens Høyrup
Section for Philosophy and Science Studies,
Roskilde University, Roskilde, Denmark

Abstract

Although the Latin Middle Ages received a number of versions of *Euclid's Elements* and several other Euclidean works, by the fourteenth century, only the Campanus redaction

from c. 1259 was in circulation. In the fourteenth and fifteenth century, this redaction was encountered by students of Arts or Medicine university faculties, even though we have scant evidence that Euclid impressed their minds. In the fifteenth century, other circles discovered him: Alberti took over the idea of elements, Regiomontanus used Euclid alongside Archimedes as an argument for the superiority of mathematics over philosophy, and one Florentine abacus school tradition was able to give correct references to the *Elements*.

A turn arrived with book printing. In 1482, the Campanus *Elements* were printed, and in 1498 and 1501, Giorgio Valla inserted pseudo-Euclidean and Euclidean material in two bulky volumes. A new though somewhat problematic Latin translation from the Greek (including also some minor works) was published by Zamberti in 1505, and until 1540 a number of reprints or reeditions of Campanus's and Zamberti's texts were published – at times in combination. From the 1540s onward, revisions, selections, and vernacular translations began to appear, all based on the same two texts. In 1572, however, Commandino made a new Latin translation from Zamberti's text and a sounder manuscript, and in 1574 Clavius produced a didactically oriented redaction. These two set the scene for the next two centuries.

Medieval Latin Background

Until the beginnings of the twelfth century, the Latin Middle Ages had access to Euclid only through Boethian translation of the *Elements* (or, quite likely, of an epitome of that work) – another translation, also from c. 500 CE (Bohlin 2012), seems not to have circulated. Part of the Boethian translation was conserved in coherent form – how much and for how long is disputed; Boethian fragments were also integrated in gromatic writings (which served didactical purposes rather than surveying).

In the twelfth century, a new translation directly from the Greek was made (ed. Busard 1987); it was used occasionally by Fibonacci (Folkerts 2006, IX) but left few traces beyond

that. The translations from the Arabic made by Gerard of Cremona (ed. Busard 1984) and Hermann of Carinthia (ed. Busard 1967) also had limited circulation. The one prepared by Adelard of Bath, so-called Adelard I, on the other hand, became the basis for the didactically adapted redaction known as Adelard II (ed. Busard and Folkerts 1992), probably due to Robert of Chester (or “of Ketton”), and for the epistemologically more sophisticated “Adelard III” (ed. Busard 2001), probably the work of John of Tynemouth. Versions II and III were then used by Campanus of Novara for his redaction, written between 1255 and 1259 (ed. Busard 2005). This redaction was well adapted to use in the scholastic university, where at least part of the *Elements* was supposed to enter the Arts curriculum (in some places alternatively with Book I of Witelo’s *Perspectiva*). Campanus *Elements* came to dominate until well into the sixteenth century. All of these except the Hermann translation contain 15 books, that is, they include a Book XIV written by Hypsicles and a Book XV written by Isidore of Miletus; of the Hermann translation, only 12 books are extant.

Euclid’s *Data* and *Optics* were also translated in the twelfth century (from the Greek as well as the Arabic) and so was the pseudo-Euclidean *Catoptrics* (Murdoch 1971, 444). The (probably pseudo-)Euclidean *De ponderoso et levi* (ed. trans. Moody and Clagett 1952, 21–31) was translated from the Arabic. However, none of these works had an influence coming close to that of the *Elements*.

Early Humanist Interest and Knowledge

The fourteenth-century humanists who had frequented one of the integrated Arts and Medicine faculties of Italian universities or an Arts or a Medicine faculty elsewhere were likely to have gained some familiarity with the first books of the *Elements*, but sources give little more than hints (cf. Siraisi 1973, 74–77). A copy of the Campanus version in the library of S. Spirito in Florence listed in a catalogue from 1451 may have been part of the legacy from Boccaccio (Ullman 1964,

285). In any case, in his *Della genealogia de gli Dei*, we find an attack on those who have had brief contact with the schools (“have seen its door”) and have looked into some vernacular booklets and now wish to be held philosophers; they are characterized by citing authors they have never seen – “Priscian, Aristotle, Cicero, Aristarchus, Euclid, Ptolemy, and others, most famous in the sciences” (Boccaccio 1564, 225^{r-v}). This may be seen as a minimal list of those authors people of manners were supposed to know about.

In the fifteenth century, Leon Battista Alberti went beyond name-dropping, manuscript possession, and possibly manuscript reading. His *Elementi de pittura* (ed. Grayson 1973, 109–129) from c. 1435 (as well as the parallel Latin *Elementa*) not only borrow the Euclidean title. “For the sake of brevity,” they also open with 5 sets of definitions, 22 in total in each of the 2 versions (not fully identical, however); for the rest they consist of specified elementary tasks similar to Euclidean problems – firstly “to describe a straight line from one point to another one.” As stated in the opening of *De pictura* (ed. Grayson 1973, 6–107), Alberti does so borrowing from mathematicians but adapting what they say about the merely intelligible to a topic interested only in that which can be seen. This is probably the first Renaissance example of use of the “geometric method” – inspired by Euclid and not by Archimedes, whose axiomatic-deductive works Alberti does not know.

In 1564, Regiomontanus – first trained and active in the University of Vienna and then under the influence of Bessarion drawn into Italian Humanism – held a series of lectures on the astronomer al-Farghānī in Padua. The inaugural lecture (ed. Schmeidler 1972, 43–53), an oration “explaining the mathematical sciences and their utility,” mixes the two currents of thought (Byrne 2006) but also shows traces of that pride of Italian mathematical practitioners which made them claim priority of mathematics over philosophy. Regiomontanus uses Euclid and Archimedes for that purpose – while philosophy is split into warring schools, “Euclid’s theorems have the same certitude today as a thousand years ago, and Archimedes’s inventions will call forth no less

admiration in a thousand centuries than pleasure in us when reading them.” In the beginning of the oration, Euclid has already been declared “the father of all geometers.”

We also find in this oration an early instance of the mistaken identification of Euclid the geometer with the philosophers Euclid of Megara mentioned in Plato’s *Phaedo* (and by Diogenes Laërtius). This Renaissance mistake may go back to Theodoros Melichita in the early fourteenth century (Heath 1926, 3) (there is no reason to believe Theodoros to have been inspired by a similar but oblique reference in Valerius Maximus nor to assume that the fifteenth-century Italian writers took over from Valerius something that medieval authors, eager readers of his, had not thought of). But Latin humanist readers, finding the name Euclid in Plato, can also have reinvented the mistake independently.

Around the same time, two encyclopedic treatises coming from the Florentine abacus school environment testify of interest in the *Elements*. One is the anonymous Florence, Biblioteca Nazionale Centrale, Palat. 573; the other is Benedetto da Firenze’s *Trattato di prattica d’arismetrica* from 1463, the autograph of which is Siena, L.IV.21. Both are described with copious extracts in Arrighi (2004). That they mention Euclid’s name is not very informative – many abacus books excelled in dropping names in the way described by Boccaccio, often in fully misguided ways. But these two treatises are different: they refer repeatedly correctly to Euclidean books (II, V, VII, IX, X), at times with quotations pointing (as could be expected) to Campanus. The citations are so similar that the two writers must be assumed to have drawn on the same intermediate source – which shows that their branch of abacus culture (descending from Paolo dell’Abbaco and Antonio de’ Mazzinghi) had a tradition for such interest in Euclid. How far this tradition goes back we cannot know, but it seems likely that it was a product of the fifteenth century. From the fifteenth century, there are also two manuscripts (Siena, L.IV.16 and 17) containing Italian translations of the Campanus version (Kristeller 1965, VI, 158; Folkerts 2006, XI 223), which might come from the same tradition.

Euclid in Print

The fifteenth century is also the time when some pure-bred humanists started collecting mathematical manuscripts for their libraries (Alberti, though a humanist, was more than that and so was Regiomontanus) – most famously of all probably Bessarion. However, Euclid was not their first choice. Accordingly, the first printed *Elements* (Campanus 1482) were made by Erhard Ratdolt in Venice in Campanus’ version. Ratdolt was no humanist but an outstanding and innovative German printer. His dedicatory letter to doge Mocenigo of Venice shows him to be more closely linked to the university tradition than to the humanist current.

This edition can be seen to have fulfilled a need. Ratdolt produced a reprint in the same year, another one was made in Ulm in 1486, and a third was in Basel in 1491 (Cantor 1892, 266f).

The first Euclidean texts produced by a humanist are found in an anthology collected by Giorgio Valla (1498, c vi^r–d v^r) – namely, *Elements* XIV and XV – and thus actually pseudo-Euclidean; Valla presents the former as Euclid’s 14th book and the latter as Hypsicles’s interpretation of the same book. Scattered properly Euclidean fragments taken from a Greek manuscript were to be found in his posthumous encyclopedia *De expetendis et fugiendis rebus opus* (Valla 1501). In this work he draws much on Proclus’s commentary to *Elements* I, which gives him access to Eudemos’s catalogue of geometers and to the dating of Euclid to the time of the first Ptolemy; nonetheless, the identification of the geometer and the philosopher from Megara survived not only Valla’s insight but also the publication of Proclus’s commentary in 1533 (*infra*).

The first full Renaissance text of the *Elements* translated from the Greek was produced by Bartolomeo Zamberti in 1505 (reprinted in 1510 and 1517 by the same Venetian printer), with copious attacks on Campanus. The (unidentified) manuscript he used was in the Theonine tradition, and Zamberti supposed that the demonstrations were due to Theon; Campanus instead had relied through Adelard on Arabic, pre-Theonine manuscripts, which is one of several reasons for the

divergences which provoked Zamberti's anger. The volume also contained Books XIV–XV, presented as “Hypsicles report of a volume supposed to be by Euclid,” respectively, Book XIV of Euclid's *Elements* “in the report of Hypsicles” (Zamberti 1505, X iiiii^r, vii^v); moreover, Euclid's *Phenomena*; the pseudo-Euclidean *Catoptrics*; Euclid's *Optics*; and his *Data*, with Marinus's introduction. A long dedication also serves as introduction, presenting the history of mathematics in its relation to philosophy from Homer to Plotinus and Proclus; where relevant, it draws on Proclus's commentary (and thus on Eudemos). Identifying Euclid with Euclid of Megara, Zamberti states him to have listened to Socrates and to be a contemporary of Plato and at the same time takes Proclus as his witness that Euclid lived at the time of the first Ptolemy. After the introduction comes Euclid's *vita*, consisting of excerpts from Suidas, Diogenes Laërtius, Plutarch, Aulus Gellius (all speaking of Euclid of Megara), Heron of Alexandria, Proclus, and Marinus (speaking of the mathematician). In the end, Zamberti attempts to find from available chronicles the epoch of Ptolemy I, coming to 291 BC; he does nothing to determine that of Socrates and appears not to be aware of any contradiction. In any case, this *vita* demonstrates to the full Zamberti's humanist credentials. Unfortunately, as Maurolico was to observe in a letter from 1556 (Napoli 1876, 27), while translating faithfully, Zamberti lacked the necessary mathematical insight and did not discover the mistakes of his manuscript.

Zamberti's attacks against Campanus were answered by Luca Pacioli, who produced a new edition of the Campanus *Elements* (Pacioli 1509), also in Venice. It promised to correct the errors that had crept in because of the negligence of copyists. Actually, Pacioli's text and his diagrams are very close to those of Ratdolt's edition, but he added a number of commentaries (Folkerts 2006, XI, 227f) – 138 in total, of which 42 over 10 lines long, according to Folkerts. Already a decade or so before publishing this edition, Pacioli had made a vernacular translation of Campanus, which however has been lost.

A phase followed where publishers might play safe and print the Campanus- and the Zamberti- texts together. The first edition of this kind was made by Jacques Lefèvre d'Étaples in 1516, containing only the *Elements* (15 books). Lefèvre d'Étaples supposes only the definitions, postulates, and common notions to be due to Euclid, while he ascribes the proofs to Campanus, respectively, Zamberti. Another combined edition was made by Herwagen in Basel in 1537 (Euclidis Megarensis 1537), with an introduction where Philip Melanchthon speaks at length about the utility and the moral implications of mathematics. It included the other Euclidean works translated by Zamberti (the *Data* still with Marinus's introduction) and the pseudo-Euclidean *De levi et ponderoso* (sic; *supra*), presented as a fragment and indeed lacking the fifth and final proposition of the medieval text (and formulated in very different words). New editions of this collection were published by Herwagen in 1546 and 1558 with only modest changes.

Already in 1533, Simon Grynaeus had brought out the *editio princeps*, also at the printing house of Herwagen – unfortunately from two low-quality manuscripts (Heath 1926, 101). It also contains Proclus's commentary to *Elements* I. Books XIV and XV are presented as “according to others, by Hypsicles.” There is no trace of Euclid of Megara, not even a polemical refutation.

The number of editions and reprints may seem to suggest that there was strong interest at least in the *Elements*. A letter from Maurolico to Pietro Bembo (ed. Spezi 1862, 80) gives the opposite impression – “Galen flourishes everywhere, the academies resound with Justinian, the marble is shattered in dialectical disputes. Why is the excellent Euclid silent? Why are Archimedes and Theodosius silent? [...] Of Euclid, hardly six books are read.” Compared to what we have encountered in fourteenth- and even fifteenth-century Humanism, however, “hardly six books” constitute a qualitative jump – and six books remained a standard school book for long.

The first (bilingual) six-book edition was published in the same year by Oronce Finé (Finé 1536). It presents itself as Finé's “demonstrations

of the first six books of the *Elements* of Euclid of Megara, augmented and emended, together with the same Euclid's Greek text, and Zamberti's Latin interpretation," all examined by Finé himself. What this means is that the part of the text which Zamberti had ascribed to Euclid – that is, definitions, postulates, common notions, and enunciations – are given as by Grynæus and Zamberti. The demonstrations are rephrased pedagogically by Finé (and marked "Orontius").

A particular six-book version of "Euclides Megarensis" was published by Johann Scheubel (1550). It also borrows the formulation of the matters which were regarded as properly Euclidean from Grynæus and Zamberti. The proofs, however, are not only Scheubel's own – the diagrams are not lettered; instead the lines often carry numbers corresponding to a supposed length; there are also regularly numerical computations – and the whole is preceded by a 76-page-long introduction to algebra (including the theory of irrationals). Rather than a humanist attempt to restore Greek mathematics, this edition is thus an early, still groping attempt at synthesis of Greek theory with the higher level of *Rechenmeister* mathematics.

A number of other editions based (sometimes faithfully, sometimes with innovations) on Grynæus, Campanus, and Zamberti are listed in Heath (1926, 101f) and Murdoch (1971, 449). Taken together they confirm that there was much more interest in Euclid in the sixteenth than in previous centuries – Maurolico's complaints notwithstanding.

Further confirmation comes from the vernacular translations of the *Elements* that appeared; at the same time, these make clear the diversity of groups that partook in this interest. Earliest was (Tartaglia 1543), "according to the two translations" (Campanus and Zamberti) but presenting a single text. Different from Finé and the combined editions of Lefèvre d'Étaples and Herwagen, Tartaglia presents enunciations and demonstrations as belonging on an equal footing to the *Elements* and adds his own discussions under the heading "The translator."

A French translation followed (Forcadel 1564) (six books only), in which the demonstrations are (justly) ascribed to Forcadel. Scheubel made a German translation of Books VII–IX in 1558; Xylander a full German translation adapted to the needs of artisans (that is, largely without proofs) in 1562 (Heath 1926, 106–108; Murdoch 1971, 449); and in 1570, Henry Billingsley made an impressive English translation, prefaced by John Dee, and including "Scholies, Annotations, and Inventions, of the Best Mathematiciens, both in time past, and in this our age" (Heath 1926, 109).

Euclid for the Future: Commandino and Clavius

All of these editions and translations, from Zamberti onward, can be said to define and even constitute the sixteenth-century Euclid. In the early 1570s, however, two very different translations appeared that were to define the Euclid of the next two centuries. One was Commandino (1572). Federico Commandino based this Latin translation on Grynæus as well as another, better Greek manuscript (still in the Theonine tradition), and also included many previously unknown Greek scholia; moreover, being an outstanding mathematician, he understood the text much better than any sixteenth-century predecessor. There were thus very good reasons that Commandino's translation became the direct or indirect basis for many new translations and editions (Murdoch 1971, 44) – also editions combining with Grynæus Greek text. It was superseded only when François Peyrard discovered and published an apparently pre-Theonine text (Peyrard 1804).

Commandino was also a better historian than his predecessors. Whereas Valla and Grynæus appear not to have believed in the identification with Euclid of Megara but did not discuss why, and while Zamberti did not notice that the evidence he draws on excludes it, Commandino wants (fourth page of the unfoliated preface) to "free those many from their error who firmly believe our Euclid to be the same as both the philosopher from Megara and the geometer" and

sets out briefly the reasons – both chronological and from what Diogenes Laërtios tells about the work of Euclid of Megara.

The other was Clavius (1574). In an initial address to the reader, Christophorus Clavius explains why all preceding editions are deficient – “excepting that of Federico Commandino, a highly skillful geometer, by whose work and diligence Euclid has been rendered in Latin in its pristine splendor.” However, Clavius’s aim is (as he explains) to produce a book that can serve those who progress in the sweet study of mathematics; therefore he does not propose Euclid’s naked words, which are often more concise than illuminating. He provides them with extra explanations, sometimes his own, sometimes borrowed from Proclus (Clavius uses Francesco Barozzi’s translation from 1560), Campanus, or others. Rommevaux (2005, 31–58) analyzes the additions and occasional changes of the Euclidean text.

Clavius published new editions of these *Elements* in 1589, 1591, 1603, 1607, and 1612. They were used for the teaching of Jesuit recruits and hence became the book behind the teaching of much of the social elite of Catholic Europe for long. They were also the Euclid which Matteo Ricci and Xu Guangqi translated into Chinese in 1607 (the usual six books), in time for Clavius to see the Chinese printed book.

Eugenikos, Ioannis

Born: Constantinople 1394

Died: Sparta 1454/5

Michail Mantzanas

Ecclesiastical Academy of Athens, Athens, Greece

Abstract

Ioannis Eugenikos was a theologian and prolific writer. He took part at the Council of Ferrara-Florence in 1438/39. His bother Marc Eugenikos was the leader of the anti-Unionists and refused to sign the Union of the Eastern Orthodox Church and the Roman Catholic Church. Ioannis followed his brother and became a radical anti-Unionist.

Alternate Names

[Eugenikos, John](#); [Metaxoloulos](#)

Biography

Ioannis Eugenikos was a cleric and ecclesiastical writer. He was born in Constantinople. He died in Sparta two years after the fall of Constantinople. His brother, Marc Eugenikos, Bishop of Ephesus, was his first teacher at the school founded by their father. Ioannis continued his studies in Mistra, under the supervision of the Neoplatonic philosopher Gemistos Pletho. Eugenikos, during his stay in Constantinople, was appointed notary, as well as chartophylax; later he was appointed nomophylax at the service of the rulers of Mistra. He maintained the office of nomophylax after he returned to Constantinople, around 1431, most probably in order to take over the management of a school. He was a member of the Patriarchal delegation to the Council of Ferrara-Florence in 1438/39. Eugenikos was the first to leave the Council, when he realized that there was no

chance the Catholics would support the Byzantine Empire. Like his brother Marc, he was a strong opponent of the Union of the two churches, i.e., the Eastern Orthodox Church and the Catholic Church, and as soon as he returned to Constantinople, he engaged in a fierce polemic against the Unionists and the advocates of the Latins, namely, Emperor Ioannis VIII Palaiologos (1392–1448) and Patriarch Mitrophanis (died 1443). As a result, Eugenikos was exiled in Trebizond, from where he later moved to Peloponnese (1442–1447). Despite his persecution from the official Church, he did not stop to fight against the Union of the two Churches.

He authored a number of polemical writings, letters, and treatises, the most influential of which is considered to be *Antirrhētikos kata tou Orou tis Florentinis Sinodou* (*Against the Decree of Union of 1439*). Ioannis' efforts to attack the Union gained Georgios Gennadios Scholarios attention. Scholarios, who was the first patriarch of Constantinople after its fall to the Turks, favored Eugenikos. Ioannis He passed his last years in the Peloponnese, where he was appointed guardian of the Metropolis of Lacedaemonia (Sparta). He was in Constantinople just before the fall and was captured by the Turks. After his release, he wrote a *lament* (*threnos*) on the fall of Constantinople.

Innovative and Original Aspects

Eugenikos' most significant treatise was the aforementioned *Antirrhētikos kata tou Orou tis Florentinis Sinodou*, in which he analyzes the causes for the dispute between the two churches. He also wrote the *Apologies pros ton Autokratora*, as well as *Parainētikos peri tis kata Christon Politeias*. Ioannis composed a vast *corpus* of writings consisting of *paramythetikoi*, *ekphrasis*, *pro-seuxai*, *kanones*, *omilies*, *akolouthies*, *hymns*, as well as *monodies* that were devoted to certain persons or historical events. His works also include the *Oration of Thanksgiving*, *Monodia eis tin Marian Palaiologinan*, *Monodia epi ti alosi tis Konstantinopoleos*, and the narration of a shipwreck he experienced in 1438 in the Adriatic Sea.

Legacy

His letters, which were addressed to ecclesiastical and political figures, point to a prolific scholar with a consistent devotion to Eastern Orthodox dogmas.

Abstract

Mark Eugenikos was a leading Byzantine scholar and theologian. He participated in the Council of Ferrara-Florence (1438–1439). He declined to sign the conciliatory agreement between the Greek Orthodox and the Roman Catholic Church. Because of his refusal he became a key figure in the anti-unionist movement and enjoyed high popularity among the Orthodox clergy and people.

[Mark of Ephesus](#)

Biography

He was born Manuel Eugenikos. His father George was chief judge and deacon of the Great Church. His mother's name was Mary and she was daughter of Luck the doctor. Despite his father's sudden death when he was a child, Eugenikos' mother cared for his education. He studied theology and philosophy under John Chortasmenos (1370–1437), a renowned mathematician and astronomer, and Georgius Gemistus Pletho (1355–1454), the famous neo-pagan philosopher. Chortasmenos instructed him in Aristotelian logic and syllogistic. It is probable that one of his future rivals, Cardinal Bessarion, was his schoolmate. Macarius Macres (1386–1431), a well-educated monk, introduced him to theology, including the works of Latin

authors, especially Aquinas. In his early adult life, he chose to teach rhetoric. Among his students were Georgios Gennadios Scholarios (1398/1405–1472), who after the fall of Constantinople became Patriarch; Theodore Agalianos; Theophanes, bishop of Medea; and his young brother John Eugenikos. When he was 25 years old, Eugenikos decided to become a monk and joined a monastery on the Princes' Islands, near Constantinople, where he studied the Scriptures with the famous monk Symeon. After 2 years they both moved to the famous monastery of Mangana and Eugenikos was ordained a priest. The monastery of Mangana was a prominent cultural center in the fourteenth and fifteenth century. In 1436 Eugenikos was elected bishop of Ephesus. When the Emperor John VIII Palaeologus (1392–1448) persuaded the Pope to organize a council in order to achieve the union of the Churches, Mark Eugenikos accompanied him in Ferrara and Florence. The emperor and the Byzantine delegates solicited the assistance of the Westerners against the Turkish threat. Although Mark was the most ardent anti-unionist and the leading figure of the party, he assisted Cardinal Nicholas Cusanus (1401–1464) in obtaining Greek manuscripts. Eugenikos was not preoccupied and his attitude toward the Catholics was moderate. Yet the Catholic delegates were in continuous disputes with him and asked the Byzantine emperor to appoint Bessarion (1403–1472) the official spokesman of the Orthodox Church because he was more suitable on the occasion. Certain Byzantine officials shared the same view. Namely, Eugenikos argued that, despite conciliatory dogmatic formulas, the Roman Church was schismatic and heretic. He also refuted the doctrine of the Purgatory, and his objections led the members of the Council to omit from the Acta of the Council any reference to the purgatorial fire. According to the sources, Pope Eugene IV (1383–1447) said that since Mark did not agree, the Council was a failure. The Pope tried to dissuade Eugenikos, but his attempts failed. Yet there are several Orthodox officials, like the bishops of Lakedemona and Lesvos, who did not endorse Eugenikos' views and attitude and moved against him. Eugenikos returned to Constantinople together with the rest

of the Byzantine delegates and the emperor. The people of Constantinople cheered him, while the pro-unionists were hooted. Joseph, the bishop of Methone and a leading pro-unionist, records that the crowd kneeled before Mark and called him a saint. The scene reminded Joseph of the reception made by the Jews for Moses and Aaron after they received the Ten Commandments from God. In 1440 Eugenikos faced serious threats against his life and he was forced to leave Constantinople. He resorted to Ephesus, which was under the Turks in order to guide his folk. After a short while he was forced to leave Ephesus and he decided to recede in Mount Athos. The ship which carried him made a stop at the island of Lemnos, where Eugenikos was arrested by the local authorities, at the emperor's order. He remained imprisoned in Lemnos for the next 2 years. During his imprisonment he composed and published a letter to the Orthodox people blaming those who accepted the union of the Orthodox and Catholic Church. Once again he accused the Catholics for heresy and exhorted his fellow Orthodox to not socialize with the pro-unionists. After he was released from prison, he returned to Constantinople. But his health was seriously damaged as a result of his hardships. In 1444 he died. Before his death he addressed his former students and collaborators asking them to continue the opposition to the Catholics. Among them was Georgios Scholarios, who delivered the funeral speech. Eugenikos addressed a letter to Scholarios, in which he named him his heir in the anti-unionist party. When Scholarios became Patriarch of Constantinople, he canonized Eugenikos and his feast day is the 19th of January. The Great Synod of 1484 included him in the list of Father Saints.

Innovative and Original Aspects

Eugenikos considered himself a disciple of St. Gregory Palamas (1296–1359), the leading figure of the Hesychasm movement, a kind of philosophical and theological mysticism, which was very popular during the fourteenth century and gradually became the core dogma of the Orthodox Church. Eugenikos defended the

distinction between divine essence and energies, which is crucial for Hesychasm. During the Council of Ferrara-Florence, his role was significant, since he was responsible for the preparation of the Orthodox. He gathered the required texts and analyzed their grammatical precision and authenticity. He did not accept any conciliatory solution concerning the Filioque, even if this was expressed in Greek language. Eugenikos argued that the Holy Spirit proceeds only from the Father. In the opening speech he accused the Latin delegates and Pope Eugenius IV for their attempt to prevent him from reading the Acts of the Ecumenical Councils because that would have weakened the argumentation of the Catholic Church. Eugenikos also rejected all the Latin authorities and texts that the Catholic delegates attempted to bring into notice during the council. Unlike Byzantine Platonism, especially Plethon, Eugenikos articulated a philosophical anthropology that focuses on the embodied life. He did not give preponderance to the soul regarding human beings. Despite his dogmatic hostility against Catholic Church and Latin Fathers and scholars, Eugenikos was influenced by Scholastic philosophy. Schmemann has proved that Eugenikos resorted to Aquinas' hylomorphism and *Summa Contra Gentiles* in order to defend some of his key doctrinal positions concerning resurrection and afterdeath punishment. Eugenikos avoided condemning Aquinas in his treatises, despite the fact that he launched fervent attacks on the Byzantine Thomists, especially Manuel Kalekas (d. 1410). It is also noteworthy that Eugenikos spent several years in the monastery of St. George of the Mangana, where the Byzantine Thomist Demetrios Kydones (1324–1398) studied and translated Aquinas' works. Despite his insistence on the preponderance of Byzantine philosophy and theology, Eugenikos did not underestimate Aquinas and Western Scholasticism. Rather he juxtaposed the Byzantine and Latin intellectual traditions. Aristotle was the common ground for Aquinas and Eugenikos. Moreover, he was interested in the works of Augustine, and during his stay in Italy, he purchased a number of manuscripts in order to familiarize himself with his theological and philosophical ideas.

Eugenikos believed that Augustine's texts contained arguments and positions in favor of Orthodox theology. It is rather interesting that Eugenikos studied and used Bernard of Clairvaux's works in order to support his arguments in favor of beatific vision, a significant aspect of Palamas' theology. His philosophical education is obvious in his treatises since he frequently presents his syllogisms in the form of *aporiae*.

Impact and Legacy

Besides his theological and philosophical works, Eugenikos is highly appreciated for his stance during and after the Council of Ferrara-Florence. He is considered as one of the pillars of the Orthodox Church. Pope Eugenius IV, according to certain sources, demanded from the Emperor John VIII Palaeologus to dismiss Eugenikos from his duties. Despite the emperor's desire for the success of the Council, he chose not to succumb to the papal demands, and he did not deprive Eugenikos of his rank.

Eustachius a S. Paulo

Born: 1575 (?), Paris

Died: 1640, Paris

Simone Guidi

Sapienza Università di Roma, Rome, Italy

Abstract

A seventeenth-century French theologian and philosopher. One of the most important intellectuals and churchmen of his time. A leading figure in the French Counter-Reformation. The author of a *Summa Philosophiae*, published in 1609, which was reprinted many times all over Europe, becoming one of the most widely used school textbooks of the time, famously favored and used by Descartes himself.

Synonyms

[Eustache Asseline](#)

Biography

A French theologian and philosopher. His real name was Eustache Asseline. Born in 1575 in

Paris, where he died in 1640. His father was Lord of Champeaux and attorney to the Paris Parliament. His mother, Marie Le Grand, was a cousin of the French statesman Claude Mangot. He studied at the Sorbonne in the same years as Pierre Bérulle and became a *Doctor* there in 1604. In 1606 he became devoted to Bernardo di Chiaravalle, who persuaded him to be ordained in the *Feuillants* Cistercian Order, where he took the name Eustachius a Sancto Paulo. Because of the Order he belonged to, he was also known as Le Feuillant. He was one of the most influential church intellectuals of his time and one of the leading figures of the Counter-Reformation in France. In 1622 Cardinal François de La Rochefoucauld appointed him Apostolic Commissioner, with the task of reforming the religious orders in France. He worked in cooperation with the main church leaders to restore proper worship in the Augustinian, Benedictine, Cistercian, and Cluniac orders. He is also known to have supported the activities of French nuns, in particular the Pontoise Carmelites, including the mystic Barbe Jeanne Avrillot Acarie, and the Port-Royal nuns, but also the Ursulines of Paris.

Innovative Aspects

Within the Paris Faculty of Theology, Eustachius published his *Summa Philosophiae Quadripartita* (first edition Paris 1609) that Descartes is known to have read (Marion 1981; Arbour 1993; Ariew 1999). There were many later editions all over Europe. His *Summa* became one of the main philosophy textbooks in the seventeenth century, reprinted many times until the middle of the century. The work is divided into four parts, dialectics, ethics, physics, and metaphysics, in which Eustachius, following the conventions of the time, sets out his system of doctrines, which were frequently marked by Scotist tendencies.

Logic

On logic and theory of knowledge, Eustachius held that the mind reaches knowledge through three stages: (Eustachius a S. Paulo 1609: In Logicam, Preface) (1) simple apprehension, or

awareness of the presence of something, without affirmation or negation; (2) judgment, the comparing and distinguishing of the objects of awareness, culminating in a judgment of agreement or disagreement about something; and (3) discourse, the result of bringing together various things, leading to the inferring of something further beyond just their sum, achieved through reasoning. Eustachius also presents an interesting distinction, which would be taken up by Descartes, between hazy and distinct understanding of discourse: the former is just understanding of what the words mean in themselves; the latter is a clear understanding of the nature or essence of the thing discussed. Still concerning his role as a possible source for Descartes, but in connection with the theory of cognition just described, it is worth noting that Eustachius put forward these epistemological ideas (which perhaps follow on from Jean Louis Vives, Pierre de la Ramée, Jacopo Zabarella, and the main sixteenth-century logic textbooks): any scientific inquiry has to be conducted through three stages, applied consecutively to two basic elements, the objects of the investigation and the meanings attributable to them. (1) First, objects of awareness need to be compared to each other, determining an order of importance in the account given of them, which then makes it possible to understand clearly any terms that presuppose the correct understanding of other terms; (2) the meanings attributed to the various items should also be compared with each other, establishing their conceptual closeness to or distance from the object of investigation; and (3) these meanings must then be compared to the objects of investigation themselves, working down to the least important objects and to minor meanings (Ibidem).

Physics

On the philosophy of nature, Eustachius, like the Jesuit theologians before him, held that matter is definable as what has quantity, whereas quality was what enabled form to be received by matter. It seems moreover that Eustachius, though an orthodox hylomorphist (Fowler CF 1999; Des Chene 2000), believed it is possible for matter to exist independently and, with God's help, to come

into being without form, whereas form would not be able, without God's help, either to exist or to come into existence without matter (Des Chene 1996, 2000).

Metaphysics

In metaphysics Eustachius is known for his opposition to essentialism and essentialistic Platonism. In his *Summa Quadripartita* he considers it irreligious to suppose that the essences of things are eternal and that there is an *esse essentiae* or *esse quidditativum* and that the impermanence of worldly things concerns only their existence but not their essence. In God there is the slightest possible distinction between existence and essence, since in God's case existence is essential, whereas for created things the distinction is neither real nor nominal, but through mediation it is modal, since existence is something different from essence but a way in which it comes about. Finally, according to Eustachius, essences preexist in God before they exist in things, as objectively real potentialities in the divine mind, which has always known them as eternal (Marion 1981).

Everard, John

Born: c. 1584

Died: 1640/41, Fulham

Ariel Hessayon

Goldsmiths, University of London, London, UK

Abstract

John Everard is not an obscure figure. He has been seen as an important Quaker forerunner, as an anticipator of the Leveller Richard Overton's unadorned prose style, and as a possible influence on the Digger Gerrard Winstanley. This Cambridge-educated, multilingual Doctor

of Divinity was a politically radical preacher who objected to the Spanish Match and also had a deep interest in alchemical, mystical, Hermetic, philosophic, and Rosicrucian texts – several of which he copied and translated from Latin into English. Besides having powerful aristocratic patrons, it is noteworthy that Everard also appealed to his poorest auditors – “beggarly fellows” “despised by the world.” He was, moreover, a heretic and charged in the ecclesiastical Court of High Commission with propagating Familism and Antinomianism. Indeed, his entire career followed a recognizable pattern: preaching incendiary sermons and disseminating heterodox doctrines, subsequent imprisonment, pleading for clemency, submission, release and re-offence. If that is not enough, Everard was also engaged in alchemical experimentation. He thus offers in miniature an opportunity to explore two important questions: the sources of radical social and religious ideas during the English Revolution and the possible connections between that radicalism and what is now considered to come under the umbrella of “Western Esotericism.”

Biography

John Everard was born about 1584, possibly in the county of Northamptonshire. It is difficult to disentangle Everard’s early life from several contemporary namesakes but is likely that he matriculated at Clare Hall (now Clare College), Cambridge, in the late sixteenth century. Everard may be the man of that name who graduated BA in 1601 and MA in 1607. Certainly his signature subscribing to the 39 articles attests that John Everard of Clare, Cambridge, was conferred the title of Doctor of Divinity on 5 July 1619. Moreover, he may be the John Everard who was successively ordained by the Bishop of Peterborough as a deacon (15 June 1606) and then priest (11 June 1609).

In late November or early December 1616, Everard married Elizabeth, orphaned daughter of Otho Mawditt (deceased Merchant Taylor) by license in the parish of St. Dunstan-in-the-West,

London. Thereafter he was appointed lecturer at St. Martin-in-the-Fields, Westminster, on 1 January 1617 (replaced 19 May 1623); instituted rector of Hinton Martell, Dorset, on 1 May 1621 (replaced 16 January 1622); and of Wilby, Northamptonshire, on 11 October 1622 (resigned 10 February 1626).

From the outset, Everard’s ecclesiastical career followed a recognizable pattern: preaching incendiary sermons and disseminating heterodox doctrines, subsequent imprisonment, pleading for clemency, submission, and release and re-offence. Thus he condemned the Lord Mayor’s and Aldermen’s administration of the Court of Orphans at a Paul’s Cross sermon on 11 January 1618, for which he was censured by the Bishop of London. Then in February 1621, he preached against Spanish cruelty in the West Indies as well as the proposed marriage of Prince Charles to the Spanish Infanta, for which he was imprisoned in the Gatehouse next to Westminster Abbey. In August 1622 Everard was committed again for saying something he should not have done (the source is not more specific). Indeed so often was Everard in and out of jail – he recalled six or seven occasions – that his notoriety brought him to the monarch’s attention. Thus King James reportedly quipped, “What is this Dr. Ever-out? his name ... shall be Dr. Never-out.”

Yet at an undetermined date, Everard also began enjoying aristocratic support. Thus according to the publisher of his posthumous collected works, “one Lord or the other” would often beg the king to grant Everard his liberty. These unnamed noblemen were most likely the courtier Henry Rich, who was created earl of Holland in September 1624 and whom Everard would serve as chaplain; and the vehemently anti-Spanish future first earl of Mulgrave, Edmund Sheffield. By the time Sheffield became one of his auditors, Everard was living at Fulham, Middlesex, and had been appointed lecturer at St. Mary Abbots, Kensington. In addition, Everard had published a sermon at the outbreak of the 30 years’ war with a Latin dedication to the philosopher Francis Bacon entitled *The Arriereban* (1618); had issued anonymously a brief account of a preternatural apparition which he interpreted as an ominous portent connected with the recent Catholic massacre of

Protestants in the Valtelline (July 1620); had completed manuscript transcriptions and translations of several alchemical and mystical writings (some of which would be published pseudonymously); and had undertaken expensive alchemical experiments, even employing the services of a renowned furnace maker. The translations indicate Everard's extensive command of languages, for besides Greek and Latin he consulted works in French and Italian. Furthermore, it can be demonstrated that Everard and Sheffield shared mutual acquaintances such as the physician Robert Fludd, not to mention a common interest in alchemical, mystical, philosophic, and Rosicrucian texts.

On 26 November 1637, a warrant was issued to seize Everard's papers and a poor young cutler named Giles Creech accused of holding heretical opinions in the ecclesiastical Court of High Commission. Under questioning Creech claimed that he had been mixed up with various sects, namely, Familists, Antinomians, and Anabaptists and that he had been infected with their pernicious doctrines through Everard's teachings. Although Creech's confession was somewhat sensationalist even a little muddled at times, many of its details can be corroborated – notably Everard's translation and later transcription of *Theologia Germanica*, which was intended for the Earls of Holland and Mulgrave (Henry Rich and Edmund Sheffield).

The action against Creech in the Court of High Commission was but a prelude, setting the stage for proceedings against Everard in the same court. These, however, dragged on over several law terms. After more than 6 months, articles were eventually drawn up against him. Even so, by 29 November 1638, the court had not yet responded to Everard's answers. Then additional articles were drawn up. Among the charges were that Everard maintained blasphemous opinions which undermined the "foundation of Christian Religion," notably that God is everything; that the pains of Hell were not eternal; that there would be no resurrection of the material body; that after the Last Judgment all things would be turned into God again; that all Scripture was false if understood literally; and lastly that he cherished the works of Hermes Trismegistus, saying that Trismegistus gave a clearer exposition of the doctrine of the Trinity than Moses.

Sentence was passed on 11 July 1639. Those of Everard's books deemed to contain heretical and schismatic doctrine, especially the *Theologia Germanica* – which along with the *Corpus Hermeticum* contained "matter of dangerous consequence" – were to be seized and publicly burned. Everard was also suspended from all his offices and fined the enormous sum £1000. Having failed to defend himself adequately against the charges, Everard submitted to the court professing his belief in the "orthodox doctrine of the Church of England." On 18 June 1640, he read his submission on his knees at the Court High Commission. His suspension was swiftly lifted, and 2 weeks later his fine rescinded. Throughout the course of these legal proceedings, however, Everard had continued undaunted with his translations of alchemical and hermetic writings. He died at Fulham sometime between 18 December 1640 and 12 January 1641.

Everard has been written about continually since the mid-nineteenth century. His historiographical fortune, however, is instructive. Accordingly, Everard has been successively regarded as a Christian Platonist, an important forerunner of Quakerism, a precursor of mystical enthusiasm, and a harbinger of the political, social, and religious radicalism that erupted during the English Revolution. Moreover, Everard has been viewed as an anticipator of the Leveller Richard Overton's unadorned prose style and a possible influence on the Digger Gerrard Winstanley.

Abstract

Experiment, considered in its modern sense, did not overall belong to natural philosophy proper until the Early Modern period. While the practice of experimentation existed already long before, it was rather limited, and no specific concept or even methodology was attached to it. The history of experimentation during the "long" Renaissance is properly the history of the gradual spreading and general establishment of experimental practices and

methodologies for the study of nature. In our entry, we shall, after some historiographical observations, outline that development in its various strands, from the Middle Ages through the Renaissance into the Early Modern period, with a focus on Europe and the Islamic-Arabic world. Experimental practices had ancient roots in medicine, alchemy, music, and optics, and these were expanded and further developed in the Middle Ages and the Renaissance. Moreover, they showed up in magnetism and were given first systematic reflections. Natural Magic and the Tradition of Secrets, flourishing from the Renaissance on, had experimental procedures deeply embedded. In the early seventeenth century, all those strands were taken up and, for the first time, conceptually integrated into a large-scale programmatic framework. Moreover, they expanded to evermore fields of research, such as mechanics, natural history, and pneumatics, among others. What we see from the early seventeenth century on is a wide spread of experiment as means of natural research, and the promulgation of what was now labeled "experimental philosophy." While the specific ways of doing experiments, and even more the ways of drawing conclusions from them, varied widely, it was out of question that experiment now counted as a viable way to learn about nature. However, it is clear that the pathway that led to that new situation is less characterized by a few singular events or authors, but was strongly rooted in broader developments of the Renaissance period.

Introduction

An encyclopedia entry on ► "[Experiment in Renaissance Science](#)" in the period between 1300 and 1650 requires a few caveats. If, toward the end of this timeframe, the notions of "Experiment" and "Experimentation" tend to be used in a more specific and recognizable form, this is not the case for the initial part of the period. This is likewise true for the concept of "observation," and Daston and Lunbeck, who have dealt with its history, point to similar historiographical

challenges (Daston and Lunbeck 2011, 11). In part, the difficulty is due to the fact that experimentation, considered in its modern and general sense, as intervention into the material world with the main goal to learn something about it, did not overall belong to natural philosophy proper until more recent times. Moreover, in the early part of our period, the practice of experimentation, while it well existed, was on the whole rather limited; and no specific word was attached to it, let alone a concept or a methodology. Indeed, the history of experimentation during the “long” Renaissance is properly the history of the gradual spreading and general establishment of experimental methodologies for the study of nature. In this entry, we shall, after some general observations, outline that development in its various strands, from the Middle Ages through the Renaissance into the early Modern period. As generally done in this Encyclopedia, we focus on Europe and (for the Middle Ages) on the Islamic-Arabic world.

Experimental procedures and practices reach back to antiquity and were not an invention of the Renaissance or of the Early Modern period. However, their role and status within the enterprise of learning about nature changed dramatically over time. From a marginal role in antiquity, they gained prominence in some fields in the Arabic-Islamic and Latin Middle Ages, and on an even wider scale in the European Renaissance period. In medicine, physiology, alchemy, optics, magnetism, natural magic, and the tradition of secrets, experiments played a prominent role and brought together crafts and practical knowledge with philosophical and mathematical considerations. When, in the Early Modern programs of a new science, experiment was placed center-stage, at least rhetorically, this did not come out of the blue, but was rather a binding-together of practices that had been made highly visible through the Renaissance.

Conceptual and Terminological Issues

Every investigation of “Experiment” in the Renaissance is at risk of strong anachronism. For instance, it is important to keep in mind that, at least in the

early part of our period, “Experimentum” and “Experientia” are terms indicating similar notions (Schmitt 1969; Agrimi and Crisciani 1990). The scholarly discussion on *Experimentum/Experientia* during the Renaissance develops as a part of the Aristotelian and Thomistic notions out of which these terms originated. This means to distinguish between *epistème*, or certain knowledge of universal truths, and *empeiria*, or tentative experience and knowledge of particulars. *Empeiria* is in Aristotelian tradition a precondition of *epistème*. By means of induction (or *epagogé*) experience of particulars can be generalized to universal knowledge. This differentiation also implies a hierarchy: experience, or knowledge of particulars, is always inferior to science (*epistème*), or knowledge of causes and universals. The former is characterized by *phrónesis*, or wisdom about specific things, while the latter by *sophía*, or theoretical knowledge of universals. As Spinoza (2002) points out, this is the basic Aristotelian and Thomistic framework which will dominate the medieval notion of experience.

Agrimi and Crisciani (1990) have shown that more specified and relevant examples of *Experimentum* as “knowledge of particulars” were developed in the late medieval period in the medical realm and also in the natural magical context. With those, we are referring to non-philosophical domains, genuinely promoting some form of intervention over nature. These types of practices tend to alter the traditional Aristotelian notion of the study of nature as the knowledge of the usual course of its events – makers of experiments are then active organizers of natural constellations. As another strand, we might add here the alchemical tradition, in which from early on different, more interventionist types of Aristotelianism have been discussed (Newman 1998; Lloyd 1991).

Medicine

There are two fields of inquiry of nature in which experimental practices reach far back: medicine (which included what we now call anatomy and physiology) and alchemy. Those traditions had strong impact on Renaissance activities.

In Renaissance medicine we frequently find practitioners' insistence on the Hippocratic-Galenic conjunction of reason and experience (Pomata 2005). Galenic categories often overlapped with Aristotelian formulations from the *Posterior analytics*, with the result that physicians sought to complement the *via rationis* with the principles generated by the *via experimenti* (Agrimi and Crisciani 1990). But this must not too easily be seen as the "way of experiment" in the present-day sense. In central fields of medicine, such as testing drugs and tracking diseases, we hardly find animal testing, and it was far from being the standard or even necessary method (Maclean 2002). By the mid-1600s, however, physicians and natural philosophers across Europe tested drugs, poisons, and possible morbid agents in animal subjects (Ragland 2017; Schickore 2017). Historians agree that this period, and especially the sixteenth century, displays a clear trend of greater attention to sensory or empirical knowledge (Pomata 2005; Siraisi 2012). Exploration in authoritative texts and the natural world, as well as new diseases such as the pox, drove much of the turn toward empirical knowledge. From Hippocratic and Galenic texts, Renaissance physicians increasingly adopted an attitude that elevated *historia*, and even reintroduced the term *observatio* as the description of a case, including even failures of treatment (Pomata 2011). The concept of *experimentum* itself was in great flux: in the thirteenth and fourteenth centuries it resonated with *experientia*, and appears in medicine with a generally stable meaning of "medical recipe" (Schmitt 1969; Agrimi and Crisciani 1990; Eamon 1994; McVaugh 2009).

Engagement with texts and controversies over facts and explanations repeatedly drove physicians and philosophers to make trials (Ragland 2017). Continuing controversies over the cause and effective treatment for the plague and other diseases required physicians to make tests of new medicinal substances, especially drugs from the Ottoman Empire and the New World. In the 1490s, controversies over the accuracy of Pliny's natural history, faced with opposing descriptions in other textual authorities and physician-naturalists' own experience, led to increasing emphasis

on personal sensation and experience of things, in conjunction with humanist textual scholarship (Ogilvie 2006). Reports of trials are increasingly common in fifteenth- and sixteenth-century medical writings, including discussions by Marsilio Ficino and by the eminent naturalist Pietro Andrea Mattioli (Ficino 1481, 1518; Mattioli 1554; Eamon 1994; Park 1999; Ragland 2017). Physicians increasingly performed trials and recorded the results in some form of descriptive *historia* and with commonplacing methods. Tests of poisons often involved a parallel structure, and some rulers sanctioned tests of supposed antidotes against poisons by the mid-sixteenth century (Palmer 1985; Findlen 1994; Stolberg 2013).

In physiological questions, late-medieval practices of autopsies for saints and aristocrats as well as learned interest in generation and other "secrets of women" attracted early interest in empirical anatomical dissections (Park 2006). Galen had described experiments with living animals, e.g., to study the pathway of urine into the bladder or the function of the heart (Schramm 1998). In the same spirit, and following a long tradition, Berengario da Carpi in the early sixteenth century performed discrete experimental interventions to test previous claims such as the supposed sieve-like action of the kidneys or the structures and pathways of the fetus and placenta (Berengario de Carpi 1521; French 1985). In some of these trials Berengario explicitly describes his experience as singular: *ista experientia* (Ragland 2017). In the 1520s and especially the 1530s, far more complete Latin editions of Galen's works spurred a revival and innovation in dissection and vivisection, with Vesalius as a particularly prominent example (Bylebyl 1979; Shotwell 2013; Durling 1961.) Anatomists increasingly turned to manual trials of structures, actions, and fluid flow in order to test competing anatomical claims, such as whether the kidneys worked by mechanical filtration alone, whether the pulse moved along the blood or the arterial coats, or whether the testes contributed any power for reproduction (Aristotle denied they produced male seed, Galen rebuked Aristotle). In the 1550s and 1560s, the next generation of anatomists and physician-naturalists increasingly performed trials to test ancient or

“modern” claims, or to make new discoveries. Paracelsian texts became more widely published in the 1570s, provoking further controversies and, with their close connexion to chemical practices, encouraging recourse to hands-on trials. In Padua, we see Santorio Santorio, a well-established doctor, proposing and carrying out a quantitative experimental series with a weighing chair in order to test and elaborate physiological doctrine, such as his own of an “insensible perspiration” (Hollerbach 2018).

In the seventeenth century, William Harvey’s experimental arguments for the circulation of the blood pointed to his elevation of the status of observational and experimental knowledge to *scientia*, even certain *scientia* (Wear 1983; French 1994). It is important to remember, though, that Harvey understood his experimental demonstrations and rational arguments for the circulation of the blood as also giving the *propter quid* of the heartbeat, all embedded in his programmatic search for the deeper philosophical ends of the circulation and other anatomical actions (Goldberg 2016). For later experimenters, such as Robert Boyle, Harvey’s experimental approach to establishing a new doctrine was a notable exemplar for “the Experimental Philosophy” (Sargent 1995). By the first decades of the seventeenth century, Van Helmont and William Harvey defended radical and widely influential revisions of learned medicine (Pagel 1982; French 1994). In the light of recent historical research, however, many of their categories and even their reliance on sophisticated experimentation appear more as the harvest of late medieval and Renaissance medicine rather than a direct turning away from it (Ragland 2017).

In sum, we see a steep rise of trial-making in medicine in the sixteenth century. Ample evidence of how widespread this practice was comes from universities, especially the University of Padua. Three to five hundred students matriculated in medicine each year at Padua, throughout the mid-1500s. Students learned that arguments based on authority were weak, and that personal experience of medicaments, clinical practice, including diagnosis, the efficacy of drugs, anatomy, uroscopy, etc. could be essential for a

successful and thriving medical practice (Stolberg 2013; Ragland 2017).

Alchemy

Recent historiography has strongly reevaluated the experimental component of western alchemy in the medieval and the early modern period. This reevaluation followed from a shift away from conceptions of alchemical practice that focused on its spiritual features. Recent historians have stressed instead that even the most symbolical aspects of alchemical texts were strongly related to actual laboratory work and experimental practice. In general, as Newman and Principe point out,

it is clear that there did exist a strong experimental tradition in the alchemy of Western Europe from the High Middle Ages through the seventeenth century. Not only did alchemy involve considerable laboratory experience and practice in a general sense, but many alchemists were even deeply concerned with testing; some employed a kind of quantitative method that is both akin to the later traditions of chemistry and quite alien to the image of alchemists as primarily seekers of an *unio mystica*. (Newman and Principe 2002, 38)

Medieval alchemists, both in the Arabic-Islamic and the Latin context, already employed refined experimental techniques (Halleux 1986; Newman and Principe 2002, 38ff.; Principe 2013). A particularly striking case is that of the author of the influential alchemical treatise *Summa perfectionis*, attributed to Geber and probably composed by the alchemist Paul of Taranto around the end of the thirteenth century. In this text, Paul displays a sophisticated experimental methodology, employing a wide range of gravimetric techniques. The goals of this text were not only practical but also an “attempt to arrive at the nature of the metals by exposing them to a variety of tests” (Newman and Principe 2002, 43ff).

Experimentation in early modern alchemy was quantitative. As a norm, alchemical recipes indicated the precise quantities of components. As Newman has shown, evidence for the use of an analytical balance goes back to the treatise *Ordinal of Alchemy* by Thomas Norton (1433?–c. 1513) (Newman 2000). Medieval and early

modern alchemy also challenged the strong separation between works of art and nature, a distinction originated from the Aristotelian doctrine. According to this notion, experiment, being an artificial and extraordinary production, would be useless for the understanding of the behavior of the ordinary course of natural processes. The challenge to this view is often linked with early modern authors, and Francis Bacon in particular; however, there had been a long-lasting debate on this topic in the alchemical tradition, with medieval alchemists claiming that true transmutation could actually replicate natural products. According to Newman, this claim was fully developed inside Aristotelian and scholastic doctrines about art and nature: “Aristotelianism, far from providing a metaphysical prohibition against experiment, actually gave alchemy the tools to justify learning from radical interventions in nature by means of laboratory-based experimentation” (Newman 2011, 315; see also Newman 1998). To sum up, alchemy was probably the first domain in which experiment was not only widely practiced, but its use for philosophical investigation explicitly discussed.

Medieval Experimentalism and the Tradition of Mixed Sciences

In the second half of the thirteenth century, the philosophies of Roger Bacon and Robert Grosseteste included features resembling more modern experimental practices. While these authors have sometimes been indicated as forerunners of the experimental method (most prominently by historian Alistair Crombie: Crombie 1953, 1961, 1994), more recent historiography agrees on the fact that the exact status of these early formulations, and also their influence on subsequent ideas of experimentation, is debatable (e.g., Hackett 1997). While Grosseteste clearly understood and introduced a notion of controlled experiment in his philosophical reflection on Aristotelian experience, we do not know to what degree he actually made use of any in his scientific work (Eastwood 1968; Marrone 1986). The difference between more recent

notions of experimental practice and these late medieval antecedents is of particular importance here. Bacon usually employed the terms “experiment” and “experience” interchangeably. He counted as experiments a long list of phenomena and notions, including “contrived or artificial experiments, casual everyday experience, reports of the experiences of other observers, the spiritual experience of divine illumination” and thought experiments (Lindberg 1996). Bacon’s new *Scientia experimentalis*, developed in part six of *Opus Majus* (Bacon 1859), might then be more precisely defined as an “experiential science,” in which knowledge is based on certain experience. At the same time, Bacon’s doctrine of experience defines a methodology that includes contrived experimentation as an integral part.

Grosseteste and Bacon, if perhaps not themselves heralds of a new experimental practice, developed their ideas in a terrain that was already receptive to operation and intervention over nature. This is sharply visible in the tradition of mixed mathematics and its expansion to magnetism. Aristotle’s notion of mixed sciences referred to natural disciplines making use of mathematical demonstrations, such as astronomy, harmonics, and optics. The mixed mathematical sciences often investigated natural behaviors that were not obvious from everyday experience, with recourse to specific instrumentation and mathematical devices and, most of all, to the notion of validation through “artificially prepared experiences” (Dear 2001, 130–131). This was particularly visible in the field of optics, which had seen Ibn al-Haytham’s highly innovative optical work in the first half of the eleventh century. Ibn al-Haytham made abundant use of experimental arguments, using a broad variety of instruments and apparatus (Ibn-al-Haitham 1989). His optical writings were translated into Latin, and Roger Bacon was one of the first authors to work with them and continue their approach. Among others, Bacon was the first to determine experimentally the height of the rainbow at 42 degrees. Also, at the beginning of the fourteenth century, Theodoric von Freiberg and the Persian astronomer Kamal al-Din al-Farisi independently executed optical experiments with a sphere of glass filled with

water in order to simulate the behavior of light on raindrops, and explain primary and secondary rainbows. Because of the late medieval incorporation of optical studies in the university curricula, treatises in the perspectivist tradition reached an enormous popularity during the Renaissance. In general, the works of Al-Haytham, Roger Bacon, Pecham, and Witelo constituted the backbone of Renaissance discussion on optical matters until the seventeenth century, counting many manuscript versions and several printed editions (Lindberg 1996; Smith 2015). For instance, in the sixteenth century, experiments on the rainbow analogous to the late medieval ones were recreated again by Giovanni Battista della Porta. René Descartes would later and independently execute again the same experiments measuring the angles of emergence (Descartes 1637). Renaissance musicians and natural philosophers drew on traditions of testing musical phenomena from at least Ptolemy's *Harmonics* to develop increasingly systematic, quantitative, and experimental analyses. Vincenzo Galilei, Isaac Beeckman, and especially Marin Mersenne tested earlier formulations of the quantitative relations between string length, tension, and pitch. As in his investigations of local motion, Mersenne tested the experiments of his predecessors with "*expériences* well-regulated and well-made" and worked toward a systematic theory of musical sound production and hearing, isolating, and manipulating factors while holding others constant (Cohen 1984; Crombie 1994).

As to magnetism, the French nobleman Pierre de Maricourt authored, in 1269, what is commonly regarded as the first text ever to be devoted exclusively to the magnet (*Epistula de magnete*, Peregrinus 1995). In his considerations and arguments about magnetism, experimental practices showed up in prominent places. It is not always clear whether Maricourt had really performed the trials he described, but there are clear positive and clear negative cases. What is more, he brought together mixed mathematics and experimental research by transferring the astronomical notion of (celestial) poles to the magnet. Finally, while he did not propose a general program of a *Scientia experimentalis*, he was possibly cited by Bacon as "dominus experimentorum" (Bacon 1859, 46–47),

and he was well aware of the novelty of his approach: he emphasized that the scholar of magnetism had to be at the same time a philosopher and a skilled manual worker – a clear and conscious deviation from traditional natural philosophy. To what degree this move was inspired by the example of alchemy (in which, as described above, a similar stance was taken) is still an open question. In any case, all further treatises on magnetism, through the Renaissance and up to William Gilbert in 1600, referred not only to Maricourt's results but also followed his experimental-philosophical approach to the subject (Grant 1974; Radelet-de-Grave and Speiser 1975).

However, apart from these specific cases, the widespread emphasis on the origin of all knowledge in the senses did not mean that the experiences (*experientiae*) generally adduced in natural philosophical discussions derived from first-person observations or tests. On the contrary, they appear most often as drawn from daily common experience, from other textual sources, or, most prominently from the late thirteenth century on, from scenarios constructed *secundum imaginationem*. It is certainly too strong to characterize medieval natural philosophy, as historians John Murdoch and Edward Grant did, as "natural philosophy without nature" and "empiricism without observation" (Murdoch 1982; Grant 2001), but it is clear that experiment in our understanding was not a general approach. Medieval philosophers at times emphasized their personal experience in natural histories, used at times to test and expand beyond works by Aristotle. Recourse to personal experience is especially prominent in Albert the Great's work on plants and animals, in which he objected to common myths and described particular cases in detail, e.g., even checking eggs and chicks in an eagle's nest over six years, lowered down a cliff face by rope (Reeds and Kinukawa 2013). Yet, in their works on motion, the intension and remission of forms, and other topics more squarely in the ambit of natural philosophy, it seems philosophers did not expect one another to actually perform experimental tests outside the realm of thought, governed by a shared analytic vocabulary and forms of argumentation.

More generally, as the previous sections show, the thirteenth and fourteenth centuries saw a reconfiguration of the relations between natural histories, medicine, alchemy, craft traditions, mathematics, and natural philosophy, with experiment being one of the major issues, and the role of mathematics another. Both in optics and magnetism, mathematical notions were brought together, by way of experiment, with craft practices on the one hand and philosophical claims on the other. This reconfiguration profoundly shaped the Renaissance developments, and needs further historical studies. It underlines, moreover, much of the critique that has been raised against Thomas Kuhn's dichotomy between a mathematical and an experimental tradition at the origin of modern science (Kuhn 1976). While his approach was historiographically innovative at its time, a study of Renaissance science and medicine (to which Kuhn gave only scant attention) makes clear how problematic that division is. Renaissance mathematical sciences were deeply rooted in practical applications and linked to natural philosophy, and it would be misleading to disentangle theory and practice in those disciplines (Bennett 1986).

Experimentation, Natural Magic, and the Tradition of Secrets

Natural magic was an important and visible strand in the sixteenth century and contributed to dignify and give prominence to operative and technical forms of knowledge. In the self-understanding of its practitioners, both the operative character and the strive for knowledge was evident, as, for instance, exemplified by Cornelius Agrippa and Giovan Battista della Porta (Henry 2008, 8–9). In traditional, scholastic divisions of disciplines, natural magic, because of its operative character, was not usually considered part of natural philosophy, a purely theoretical activity. By contrast, magical texts themselves stressed the philosophical character of their discipline (Anstey and Vanzo 2012). Such an understanding can already be found in Giovanni Pico della Mirandola (1463–1494) who had stated that “magic was the practical part of natural philosophy” (Pico della Mirandola

1995), and hereby followed the byzantine Neoplatonist philosopher Michael Psellus (Zambelli 1973, 136).

Given the practical character of natural magic, it is appropriate that modern historiography emphasizes its role and importance in the origins of early modern experimentation. In analyzing the origins of modern science, Floris Cohen associates Francis Bacon and William Gilbert because of their common “empirical, magic-infused, and practice oriented” programs and their general, “liberal use” of the literature in the genre of natural magic (Cohen 2010, 249). He sums up that the transformation and “consolidation” of a fact-finding experimental tradition in the early seventeenth century overall happened within magical and organic worldviews (Cohen 2010, 260). John Henry, in his survey on the Scientific Revolution, mentions the “pragmatism” and “empiricism” of the magical tradition, and its “inextricable” link with technology (Henry 2008, 58), something also William Eamon pointed out (Eamon 1983). Henry also links magic with the rise of court academies: for instance, he refers to the Accademia dei Lincei as to an institution for the “advancement of natural magic.” At the same time, however, the precise forms of the interaction between natural magic and early modern experimental science are still not well defined and understood, as again John Henry has sharply formulated (Henry 2008, 58).

Similar concerns can be raised for the genre of secrets, a tradition with its roots in Hellenistic times, but extremely popular all over Europe during the Middle Ages and Renaissance, brought to general attention by the seminal work of William Eamon (1994). By “secrets” one should mostly intend collections of recipes and instructions derived from artisanal practices, medicine, practical alchemy, cookery, and so on. These texts were often “linked with a literary tradition of works that promised to reveal the esoteric teaching of revered authorities like Aristotle and Albertus Magnus” (Eamon 1994, 4). Eamon traced an evolution from medieval times to the printed books of secrets of the early modern period, suggesting that the recipes in such books were the “‘missing link’ between medieval ‘secrets’ and Baconian

experiments” proper (Eamon 1994, 9). Early modern secrets articulated a “novel concept of experimentation,” because they were not anymore private, orally transmitted recipes of the craft tradition, common in the medieval period – they were in fact written down and published, an early form of what Francis Bacon would have called *experientia literata*, or literate experience, experience put down in writing (Eamon 1994, 9).

The collection of secrets particularly flourished in courts and academies. Giovan Battista della Porta, author of the extremely popular book of secrets *Magia Naturalis* (della Porta 1589, initially published in four books in 1558 and subsequently enlarged to 20 books in 1589), was the founder of the short-lived Accademia dei Secreti in Naples in the 1560s and, subsequently, a leading member of the Accademia dei Lincei. Among others, the courts of the emperor Rudolph II and Francesco I de’ Medici were leading centers of an “economy of secrets,” where recipes and trade secrets became valuable commodities in the courtly marketplace (Eamon 1994, 270–271; see also Findlen 1994). While the tradition of secrets testifies of a strong interest in experimental and technical practice during the Renaissance, more complex is the question of their relevance for the subsequent development of experimentation. Certainly, as for instance Peter Dear notices, secrets were relevant, as they promoted “attitudes” of non-academic (non-Aristotelian), practical, artisanal knowledge (Dear 2006). Eamon has specified further their role, suggesting that authors of books of secrets did not intend “their works to be read as experimental books in the usual sense: that is, they did not expect, nor did they instruct, readers to experiment with the recipes or even to deviate from them in any way.” Recipes came as “tried out,” already “certified by experiment.” Books of secrets were, so to speak, like “cook-books” whose primary aim was not that of “serving as guides to experimentation,” but to “demonstrate the authority and expertise of the author” (Eamon 2011, 29–30). How their role in the development of the notion of the early modern experiment can be grasped in detail, however, is still an open question. What we can see, however, is that books of secrets ended up

presenting, deliberately or not, the role of experimental “storehouses”: catalogues and collections of experiments, to be copied, passed on, and possibly tried. This was for instance the case of Francis Bacon and his use of Della Porta’s *Magia naturalis* (Rusu 2017).

The Loci of Experiment

It is instructive to complement the above view on various experimental strands by a survey of the institutions and spaces at which those experiments were actually conducted. After all, experimental activities require specific resources, such as materials, equipment, instruments, spaces, and helpers, often those with craft experience. Those resources were expensive and not easy to have. No surprise then that the court, be it a minor or a more important one, was a central place of technical practice and experimentation. For alchemy in particular, courts were the typical home. They offered the necessary space and financial support. But, while the court was a typical place of experiments, it was also a dangerous one: existence at court was precarious and totally dependent on the patronage and good-will of the ruler (let alone the occasion when the ruler changed). Rulers had their expectations when they supported an alchemist (be it practical or symbolic successes, depending on what the alchemist had promised), and once they saw those expectations not fulfilled, they often withdrew their support, and sometimes put the alchemist to jail or death (Moran 1991; Nummedal 2007).

The example of alchemy in courts is also relevant because it highlights the existence of a broad constellation of environments in which experimentation was conducted for usefulness and profit. For those constellations, Pamela Long has suggested the concept of “trading zone” (originally introduced by Galison for particle physics: Galison 1997) to identify places in which artisans and practitioners “engaged in substantive communication” with learned men and scholars (Long 2015). Apart from courts, Long refers, for instance, to mines, arsenals, but also to commercial environments like the shops of

instrument makers. The concept is particularly useful to describe situations in which experimentation escaped traditional, more philosophical categories, and also settings marked by strong technological innovation and presence of commerce, in the absence of a courtly culture of patronage – two cases in point being, for instance, the Republic of Venice and the Dutch Republic.

Following the claims of some seventeenth-century experimentalists, historiography has long regarded universities as alien or even opposed to experiment. More recently, however, it has become clear that there were indeed numerous and important experimental activities at universities, in particular at the medical faculty. With botanic gardens, herbaria, and anatomical theaters (already in the sixteenth century, though not permanent in those early times), the medical faculty had both the resources and the experience to allow for experiment, and indeed important medical and physiological experiments were conducted here, sometimes even on large scale, as the case of Vesalius and the high numbers of students in Padua may illustrate (Stolberg 2013; Ragland 2017). Apart from the medical faculty, however, there was not much experimental activity at universities. The reason was perhaps less a general resistance against experimental research, as was sometimes claimed, but rather a question of resources and structures: teaching was traditionally focused on texts, and accordingly there were resources in the form of libraries, scriptoria, etc. To install resources for experiments, by contrast, would have required not only a major financial investment but also a major revision of established structures. However, it was already around mid-seventeenth century that also the philosophical faculty of some universities (such as Würzburg in 1657, by the Jesuit Gaspar Schott) would start to implement those restructurings (Wiesenfeldt 2002) – a point that is apt to revise the traditional view of universities as resisting experimental approaches.

Again, other places of experiment were the homes of interested individuals who could afford and were ready to invest both resources and their own time. Pierre de Maricourt might have counted

among those, but certainly many of those doing natural magic (some might have been at courts too) over the Renaissance period. Not the least, clerical institutions provided a stable environment for scholarly activities throughout our period, and some of them seem to have allowed space for experiments and sometimes (al-)chemical laboratories (Campbell et al. 2018). Roger Bacon's optical experiments illustrate the point, but also medical gardens at monasteries, and the much later case of Newton's alchemical laboratory in Cambridge might not be singular. For fields with immediate practical aspects such as magnetism, also workshops of instrument makers were in some cases (such as Robert Norman in the second half of the sixteenth century) spaces for experiments.

The survey makes clear that still in the Renaissance there was no genuine place of experiment. Apart from medicine, there were no institutions that provided space and resources with some stability. Once experimental research raised in size and importance, this situation would become even more unsatisfactory. This may be the background of why, from mid-sixteenth century on, the model of academies, already practiced since mid-fifteenth century in the scholarly fields of language or classical studies, was taken up and adapted to experimental research. This was either done on initiative of individuals talented in gathering others around them (such as della Porta with the Accademia dei Secreti, 1560, or Joachim Jungius with the Societas Ereunetica sive Zetetica in Rostock, 1622, or a small group of doctors in Schweinfurt with the Academia Naturae Curiosorum (later Leopoldina) in 1652), or of rich noblemen (such as Federico Cesi with the Accademia dei Lincei, 1603), or of rulers (such as the Medici dynasty with the Accademia del Cimento, 1657). When in the second half of the seventeenth century, further academies were founded (London and Paris) and became (at least for a while, and without making the previous places disappear) the central place for doing and exchanging experimental research, this had its roots in the late Renaissance, and provided a solution for the challenges that had become visible in that period.

The Rise of Experimental Philosophy in the Seventeenth Century

The various Renaissance developments came together in the Early Modern Period and formed a substantial part of what is often called the Scientific Revolution. Most significantly, moreover, strong voices in that period promoted not only experimental practices, but a full experimental program, coming along with the (new) claim that experiment should form the central or even the only pathway to make progress in knowledge about nature. In this last section, we shall briefly describe three of those approaches and sketch how experimental practices and experimental philosophy spread over Europe.

In 1600, the English court physician William Gilbert published *De magnete*, a study of magnetic and electric phenomena, including geomagnetism. Experimentation played a fundamental part in Gilbert's research, as it had done in other magnetic treatises before him. However, other than those older authors, Gilbert formulated an explicitly experimental research program. *De magnete* opens with programmatic remarks: "Nothing is brought forth in this book which has not been investigated and made completely certain, performed and done [*actum et transactum*]." Gilbert's declared methodology proceeded through a combination of "sure experiments and demonstrated arguments," avoiding the "probable conjectures and the opinions of philosophical speculators" (Gilbert 1600; trans. Gilbert 1900). One has to be careful, of course, not to take such methodological announcements to be strictly followed through the book: indeed, there are numerous passages no less speculative than previous works. What is clear, however, is that Gilbert performed a large number of experiments, and also integrated experiments from others, such as Pierre de Maricourt, della Porta, and Robert Norman (mariner, instrument maker, and author of *The New Attractive*; Norman 1581). He frequently used experiments to make philosophical arguments about the cause of phenomena, be it directly by way of analogy. The question of why Gilbert was not content (as others before him, e.g., in the natural magic tradition, or in magnetic

research by the Jesuit scholar Leonardo Garzoni whose text Gilbert knew (Ugaglia 2006)) with practicing an experimental approach, but turned to spell out a sort of methodological program, has scarcely been treated (see Georgescu 2017). The other question, however, i.e., from where Gilbert's experimental methodology specifically derived, has raised historical controversies, with a general view on the origins of modern experimental practice. In a classic paper, Edgar Zilsel identified the origins of Gilbert's method in the experimental activities on magnetism of the practitioners of the mechanical arts, miners, and Renaissance instrument makers (Zilsel 1941). The case fit Zilsel's thesis according to which the scientific revolution was mainly brought about by the collaboration of natural philosophers and elite practitioners of the mechanical arts. More recently, John Henry has argued against this interpretation, suggesting that Zilsel overemphasized the role of craftsmen, and that Gilbert's method derived instead from the magical tradition (Henry 2001). Jim Bennet (1986) has emphasized the impact of the tradition of practical mathematics, highlighting the role of the instrument maker Robert Norman.

A strong push for the use of experiments in philosophical arguments was given by Galileo Galilei, Florentine court mathematician and philosopher after a long period as mathematics professor and instrument maker. While Galileo did not formulate an explicit experimental research program, he used experiments widely from early on, e.g., in disputes about floating bodies or about the nature of heat and cold. It might be noted, however, that also his opponents, often Jesuit scholars, performed experiments to make their arguments. In Galileo's mechanical considerations, there was also another use of experiments visible, namely, by most precise measurements and evaluation for mathematical schemes, as in his famous experiments with the inclined plane or with pendulums. This latter use gave rise to historiographical disputes, going back to the claim of the French historian of science Alexandre Koyré that for Galileo experimentation was a secondary activity compared to mathematical deduction of physical theories and that he actually had not performed many of the experiments he discussed in his

works (Koyré 1939). But already earlier Leonardo Olschki (1927) had shown how Galileo was proficient in the use of instruments and machines, and close to the world of technical practitioners and engineers. In 1961, Thomas B. Settle showed that, contrary to Koyré's view (Koyré 1953), Galileo could have materially executed his experiments on the inclined plane (Settle 1961), and Stillman Drake brought attention to actual manuscript evidence for Galileo's experimentation (Drake 1990). Current scholarship agrees that Galileo executed experiments from an early stage in his career. As early as 1592, together with his patron Guidobaldo Dal Monte, he performed experiments for the determination of the parabolic trajectories on bronze balls rolled over inclined planes (Renn et al. 2000, for his experiments with pendulums see also Palmieri 2009). Furthermore, because of his activities as an instrument maker, he was intimately used to the practice of instruments and tried to experimentally develop and understand lenses and thermoscopes (Valleriani 2010).

Perhaps the most visible experimental program was proposed by Francis Bacon – lawyer, statesman, and prolific writer and philosopher. In his program, the role of observation and experimentation was central and fundamental, and put to the service of a radical reform of the way to obtain, produce, and validate new knowledge. Bacon also made every effort to mark a strong discontinuity from prior authors in the reflection on experimental practice (e.g., by downplaying Gilbert's work). He emphasized the need of a broad empirical foundation: in his mature form, he grounded his project on a plan for the production of “natural and experimental histories,” furnishing the raw materials to be elaborated further through his new philosophical approach. Natural history traditionally had the task to order and categorize all knowledge. This genre got transformed in the Renaissance when naturalists aimed at highly precise descriptions construed in contrast to what they saw as inaccurate and partial accounts of their medieval predecessors (Ogilvie 2006, 6–7). Inspired by the example of authors in the natural magic tradition, Bacon's idea further departed from that model: his histories were not only for the purpose of describing, but also for that of

concrete application and operation. For this reason, Bacon introduced as a fundamental part the history of the mechanical arts, also referred to as “Mechanical and Experimental” history (*Parasceve ad Historiam Naturalem, et Experimentalem*, Bacon 2004, 455). He even suggested that the experiments of the arts (in fact, identifiable with technical inventions) were the most important part of natural history, as they have “the greatest importance for philosophy.” Baconian histories were supposed to extend far beyond the traditional realms of the genre (such as mineralogy, botany, zoology), covering every aspect of natural and human activity. In general, according to Bacon, proper natural history should be “a single unbroken run of narratives” derived “from the Course of Nature, the Wandering of Nature, and Art or the application of man to natural things.” They also included more philosophical topics that Bacon deemed essential and universal, like the histories of “Dense, Rare, Light, Heavy, Hot, Cold, Consistent, Fluid, Similar, Dissimilar, Specific, Organic and the like” (*Descriptio globi intellectualis*: Bacon 1996, 103–109). A deeper study of the numerous natural and experimental histories Bacon himself had worked out (such as Corneanu et al. 2012; Jalobeanu 2015 or Pastorino 2011) has started only recently, whereas previous historical accounts had focused on his more programmatic writings. These new studies make clear that observations and experiments in those histories took a wide variety of forms; however, all of them were construed as trials, tests, inquiries, “investigations by means of experience” (OED, s.v. “trial”).

Bacon's experimental program had a deep influence, particularly in seventeenth-century England, where Baconian experimentalism became engrained in society and culture (Webster 1975). In the second half of the seventeenth century, the Royal Society made him its hero, and there were indeed important attempts to pursue the “natural and experimental history” approach further, with authors like Boyle, and a flood of experimental and observational reports in the early *Philosophical Transactions*, among others. However, even in England, Bacon's

program did not push out other approaches like in the case of William Harvey and physiological experimentation, traditional natural history, and chymistry. In many of those, experiment played a central role. The expression “experimental philosophy” used as early as the 1635 by Samuel Hartlib and in common use from the 1650s/1660s on (Anstey 2005; Anstey and Vanzo 2012) did not grasp a very unified phenomenon, but essentially meant doing natural philosophy while including experiments.

This variety of approaches was also present in other European countries. While the English context has been discussed at length, a comprehensive historical analysis of the development of experimental practice in the first half of the seventeenth century on the continent is still lacking and is a desideratum of future scholarship. As a common basis, however, we clearly see that importance of experiment as means of research steadily grew during the period under consideration. This held for France, where a few circles of experimental philosophers formed in various cities, notably Aix, under the tutelage of Fabri de Peiresc, and Paris, with the supervision of the Minim friar Marin Mersenne and Blaise Pascal (Brockliss 1992, 60–61). Also, in the 1640s, Pascal and his circle conducted influential experimentation on barometric pressure and the vacuum in Rouen (Shea 2003). Also the founding of the Paris Academy of Science in 1666 stood fully in the sign of experimental research. In the Italian states, with researchers such as Vincenzo Viviani or Evangelista Torricelli, and with the Accademia dei Lincei, and later the Accademia del Cimento, experimental approaches were vivid. Finally, it is important to highlight the strong presence of experimental activities in the Jesuit order, with researchers such as Leonardo Garzoni (Venice), Niccolò Cabeo (Parma), Athanasius Kircher (Avignon, then Rome), Honoré Fabri in Paris, and Gaspar Schott in Würzburg (who was active in the natural magic tradition and made Otto von Guericke write down the results of his experiments with the first ever-built airpump), among many others (Feingold 2003).

To sum up, what we see in the early seventeenth century, and more so in its second half, is a

wide spread of experimentation as means of natural research. While the specific ways of doing experiments, and even more the ways of drawing conclusions from them, varied widely, it was out of question that experiment was a viable way to learn about nature. This was a radical change from just a few decades before. It is however clear that the pathway that led to that new situation is less characterized by a few singular events or authors, but was strongly rooted in broader developments of the Renaissance period, as described in this entry.

Exploration, Renaissance Concept of

Daniele Cozzoli

Pompeu Fabra University, Barcelona, Spain

Abstract

Exploration influenced Renaissance philosophers indirectly rather than directly. Although few references to it are found in the writings of Renaissance philosophers, the discoveries in the Americas, soon referred to as a New World, stimulated the imagination of many European thinkers and intellectuals leading them to reconsider a number of fundamental classical philosophical issues such as the plurality of the worlds, human nature, atheism, slavery, and just war. It was, however, not until the seventeenth century that reflection on exploration deeply influenced the philosophical ideas of Europeans.

Heritage and Rupture with the Tradition

Greek culture linked exploration to the acquisition of knowledge and wisdom. The Greeks ascribed the origin of most of their knowledge to the Egyptians. Plato's travels to Egypt, Magna Graecia, and

Sicily played a part in the development of some of his most important doctrines (Field 1930, p. 5; Capizzi 1984, p. 89). In medieval culture, the figure of Ulysses was associated with the desire to know. Dante (1265–1321), in his *Comedy* (c. 1308–1320), described how the Greek hero had perished in the vain attempt to cross the Gibraltar channel in order to learn about the unexplored world. Ulysses persuaded his comrades to follow him with a short speech, which included the famous line: “fatti non foste a viver come bruti, ma per seguir virtute e canoscenza” (“you were not made to live like brutes, but to follow virtue and knowledge”) (Dante, *Comedy, Inferno*, ch. 26, lines 118–20). At the beginning of his *Utopia* (1516), Thomas More (1478–1535) explicitly linked the journey to Utopia of Raphael Hythloday, who claimed to have traveled with Amerigo Vespucci, to that of Ulysses and, above all, to Plato, stressing in this way the connection between exploration and the search for knowledge (More 1989). The relationship between exploration and the desire for knowledge also had a negative side, as it often entailed conquest and expropriation. In the *Ash Wednesday Supper* (1584), Giordano Bruno (1548–1600) associated exploration as conquest with the myth of the Argonauts by quoting Medea’s reproach to Tiphys, the Argonauts’ helmsman, in Seneca’s tragedy (*Medea* ll. 375–79) and with the censure of Columbus’s action in the New World (Bruno 1584/2002, vol. I, p. 451; Granada 1990; Ricci 1990). It is worth noting, however, that for those writers who praised the conquest of the New World, such as Gonzalo Fernández de Oviedo (1478–1557), the myth of the Argonauts did not have any negative connotation in relation to exploration (see Coello de la Rosa 2002, 2012; Oviedo 1535).

Innovative and Original Aspects

According to a number of scholars (Elliott 1970; Gliozzi 1977; Ryan 1981), the main features of European philosophy and culture were not much affected by the discovery of the New World. References to the Americas do not seem to have been crucial in the writings of the most important Renaissance philosophers. Although Johannes

Kepler (1571–1630) and other European astronomers used the catalogue of southern stars compiled by the Dutch navigator Pieter Dirkszoon Keyser, there was apparently little connection between the contemporary exploration of the earth and the astronomical study of the heavens (Cañizares-Esguerra 2006, p. 80). At the beginning of the sixteenth century, philosophers were not greatly concerned with the novelty of the New World. An interesting case is that of the Society of Jesus, who promoted teaching and scholarship in Europe and evangelization in the Americas and Asia. The most important commentators on Aristotle and authors of late scholastic Aristotelian works, such as Benedict Perera, the Coimbra Commentators, Domingo de Soto, Francisco Suárez, and Francisco de Toledo, were Iberian Jesuits. Yet, their thought was not affected by the work of their brethren in the New World (Bianchini et al. 2013). Nevertheless, the discovery of the New World affected the world of ordinary Renaissance men and women (Grafton 1995), and exploration did have an indirect impact on philosophers: rather than acting at a causal level on their philosophical doctrines, the discovery of the Americas stimulated the imagination of European intellectuals and played a part in a number of original Renaissance ideas and theories. Authors of tales and chronicles about the Americas referred to the lands discovered beyond the Atlantic as a New World. At the beginning of his *Historia de las Indias*, Francisco López de Gomara (1511–1566) contrasted the view of ancient philosophers such as Democritus, Leucippus, Anaximander, Plutarch and Galen, as well as Heraclitus and the Pythagoreans, on the existence of many worlds with the Christian doctrine of the uniqueness of our world, which was also rooted in Aristotle. Nonetheless, he explained that he would still refer to the Indies as the New World. Francisco Cervantes de Salazar (c. 1514–1575), however, in his *Cronica de la Nueva España* maintained that referring to the Indies as a New World was a mistake, as there was only one world (de Gomara 1554, pp. 1–3; Cervantes de Salazar 1985; Gliozzi 1977, p. 209). In doing so, these authors ended up relating the philosophical debate on the plurality of the worlds to the diversity of the lands, people, animals, and

plants experienced by Europeans in the Americas, which, in turn, inspired the imagination of some philosophers. In his *Expulsion of the triumphant beast* (*Spaccio della bestia trionfante*, 1584), Giordano Bruno linked his views on the existence of many infinite worlds and his severe criticism of Aristotle's idea of a single universe with the transoceanic travels and creation of trade routes with the Americas which connected many distant peoples (Romeo 1953; Aquilecchia 1955; Granada 1990; Ricci 1990). Tales of sailors and travelers led other intellectuals to reconsider their opinions. Michel de Montaigne (1533–1592) developed his criticisms of contemporary French culture and society in light of the stories told by explorers of the Americas and of his own experience of encountering Native Americans in France. He contrasted the purity of life of the savages in the New World to European civilization, and he compared the customs of Native Americans with the accounts of barbarians and Middle East peoples in the works of ancient Greek and Latin authors. In his essay “On Cannibals” (1580), he recalled asking three Native Americans from Brazil at the Court of Charles IX in Rouen about the habits of the French (de Montaigne 1969, vol. 1, pp. 251–265). This essay also reveals the difficult interaction at the Paris court between Montaigne and the visiting Native Americans. It is clear that he was not interested in understanding Amerindian civilization but instead was seeking evidence for his philosophical relativism and for his criticism of French society (de Montaigne 1969, vol. 1, pp. 251–265; Gliozzi 1977).

The new information from the Americas stimulated more critical minds to reconsider aspects of Aristotelianism. For Pietro Pomponazzi (1462–1525), the discovery that the Southern hemisphere was inhabited required a revision of Aristotle's notion of demonstration as a form of knowledge production, since a number of conclusions Aristotle drew by means of his theory of science had been refuted (Nardi 1965; Pagden 1993, p. 90). Pomponazzi's suggestion was not followed up, however, and the Renaissance debate on demonstration continued to develop along the lines of Aristotelian logic (Arndt 1971; Engfer 1982; Mancosu 1996). In the seventeenth

century, new data from the Americas began to have had a more direct influence on the philosophical and scientific debate over Copernicanism and on the acquisition of scientific knowledge. Johannes Kepler, in the *Dissertatio cum nuncio sidereo* (*Conversation with [Galileo's] starry messenger*, 1610), stressed the difference between empirical observation and theory by comparing Columbus's direct observation of what he believed to be the antipodes with Ptolemy's theoretical work on geography (Kepler 1965a, b, p. 17; Jardine 1984; Pagden 1993, p. 91). Other writers compared Galileo to Columbus (Pagden 1993, pp. 97–98). The comparison between major breakthroughs in physics and the discovery of new worlds by sailors enjoyed considerable popularity throughout the centuries. It is suggestive that Arthur Holly Compton announced to James B. Conant, the president of Harvard, that Enrico Fermi had produced the first controlled nuclear chain reaction with words: “the Italian navigator has just landed in the new world” (Compton 1956, p. 144), drawing a comparison between the new Galileo and Columbus. In his *Somnium, sive Astronomia lunaris* (1609), a fictional tale of lunar exploration, Kepler connected earth and space exploration, a topic that gained momentum in the Western imagination during the Cold War space race (Kepler 1965b; Bonhomme 2012; Gerovitch 2015).

In the seventeenth century, such suggestions were not only a matter of mere rhetoric. In his *Apologia pro Galileo* (*A defense of Galileo*, 1622), Tommaso Campanella invited the Roman Church to revise the interpretation of the Holy Scripture on the impossibility of the motion of the earth, by arguing that the interpretation of the Holy Scripture had already been revised on the impossibility that the Southern hemisphere could be inhabited after travelers from the New World provided evidence for it (Campanella 2001). Francis Bacon, in the *New Atlantis* (1627) and the *Novum Organum* (1620), related the construction of a state-organized research system to the knowledge gained by exploration (Bacon 1963a, b; Gliozzi 1977, pp. 232–246).

Explorers' tales and chronicles also stimulated the Renaissance imagination about the utopian

state. Tales of travelers had excited the imagination of the Europeans for centuries. The writings of John of Mandeville and Marco Polo circulated widely, even in the lower strata of European societies: Menocchio, the miller studied by Carlo Ginzburg in *The cheese and the worms*, for instance, read Mandeville's *Travels* (Ginzburg 1976). Such tales were rooted in the medieval taste for the fantastic: like epic poems of the period, they were not intended to be informative but to intrigue the imagination of the reader (Bloch 1994, pp. 143–156). It was a combination of the humanist need for careful historical research and the discovery of the New World that led authors to focus on exploration as a source of knowledge. Thomas More contrasted the fantasies of authors such as John of Mandeville with the realism of Hytholoday's (in fact, fictional) account. Nonetheless, it was only in the seventeenth century that Francis Bacon (1561–1626) in his *New Atlantis* directly linked the construction of a utopian state and the process of acquisition of knowledge to exploration.

Renaissance political philosophy was also indirectly influenced by the exploration of the Americas. Neither in *The Prince* (1513/1514) nor in the *Discourses on Livy* (1518/1519) did Niccolò Machiavelli refer to the exploration of the Americas. The Florentine secretary's political reflections were developed by comparing Roman history with contemporary events rather than by considering the discovery of the New World (Machiavelli 1980, 2016). Nonetheless, the “Age of Exploration,” by reinforcing the nation-state and international diplomacy, encouraged thinkers to reconsider the nature of political power (Cassi 2007). European expansion into the New World posed new questions for jurists and philosophers concerning dominion over the seas and over the inhabitants of the Americas. Throughout the Middle Ages, jurists extended Roman law on the “Mare Nostrum” (Mediterranean Sea) in order to regulate conflicts between maritime republics. Since Roman law was concerned with the seas close to the coast and the islands, whereas oceanic exploration entailed establishing a legal framework for vast and far lands and seas, it was necessary to reformulate the Roman categories

of *res publica*, *res nullius*, and *res commune* (Cassi 2007).

Once it was recognized that the New World was not the East Indies, Europeans made efforts to understand who the Natives they encountered there were. Had they received the divine word? Were they proper human beings? The debate concerning the nature of the Amerindians led jurists and philosophers to rethink the idea of human nature and reconsider the arguments against the descent of all human beings from Adam. A debate arose between the polygenists, who believed in the simultaneous and independent creation of humans in different places, and the monogenists, who accepted the biblical account and, therefore, had to postulate inter-oceanic travels long before Columbus (Gliozzi 1977; Cañizares-Esguerra 2006). Bruno, in *Expulsion of the triumphant beast* and in *On the infinite universe and worlds* (*De lo infinito universo et mundi*, 1584), challenged the monogenetic descent of the Amerindians from Adam, arguing instead in favor of the spontaneous generation of human beings. In *De immenso* (1591), he also defended the pre-Adamite hypothesis by claiming that only the Hebrews had descended from Adam (Gliozzi 1977, pp. 344–345).

The debate on the nature of the inhabitants of the New World was also intertwined with another classical philosophical issue: the relationship between slavery, human nature, and just war. Aristotle connected these concepts by arguing that slavery could be the consequence either of inferiority by nature or of a just war (*Politics* I.6). In the sixteenth century, Iberian philosophers and intellectuals began to be concerned about whether the subjugation of the Amerindians by the *conquistadores* was a form of legitimate warfare. In the famous debate held in Valladolid in 1550, Juan Ginés de Sepúlveda (1490–1573) argued that the Spanish Crown was entitled to wage a just war against the Amerindians, while Bartolomé de las Casas (1474–1566) defended the Amerindians (Pérez Luño 1992; Casas 2009). The most interesting contribution to the debate was provided by Francisco de Vitoria (1492/1493–1546). In his two most famous lectures, *De indis et de iure belli* (*On the Indies and the law of war*), drawing

on Thomas Aquinas, he opposed the traditional doctrine laid down by Pope Innocent IV that a difference of religion could justify war, which was the basis of Sepúlveda's case. For Vitoria, however, "the sole and only cause for waging war is when harm has been inflicted" (de Vitoria 2008, p. 303). He maintained that in a war it was possible for both sides to claim that they were fighting a just war, even the Turks and the Saracens, who could say that they were waging war in the service of God (ibid., pp. 306–307).

Abstract

Conventual Franciscan, lived between the second half of the sixteenth century and the first half of the seventeenth century, Filippo Fabri was one of the most representative exponents

of Italian Scotism. Among his most important works are *Disputationes theologicae* (1613–1614) and *Expositiones et disputationes in XII libros Aristotelis Metaphysicorum* (1637). In 1630, he died in Padua.

Alternate Names

[Faber, Philippus](#)

Biography and Thought

Filippo Fabri was born in Spianata, near Faenza, in 1564, and in 1582, he entered the Order of Friars Minor Conventual. After studying in the colleges of his Order (Ferrara, Padova, Roma), Fabri in 1593 he took doctoral degree at the College San Bonaventura in Rome. Following graduation he taught in several colleges of the Order: Venice, Cremona, Parma, and Padua (Forlivesi [2011](#): 95; Forlivesi [2014](#): 425). From 1603 to 1606, he taught metaphysics *in via Scoti* at the Faculty of Arts of the University of Padua, and from 1606 to 1630, always in the same faculty, he held the chair of theology *in via Scoti* (Forlivesi [2011](#): 95–97; Forlivesi [2014](#): 425; Forlivesi [2018](#): 42–43). In Rome in 1624, he was commissioned to reform the constitutions of the Order, and in 1625, he was elected Provincial Minister of the province of Bologna (Forlivesi [2011](#): 96). Fabri's philosophical reflection focuses

mainly on the nature of metaphysics (see Forlivesi 2018), and his position can be defined “proto-ontologistic”: metaphysics is science of the supreme *rationes*. Fabri is the most representative defensor of Aristotelian tradition in opposition to three specific theoretical positions: (I) Gianfrancesco Pico della Mirandola and Francesco Patrizi da Cherso; (II) Francisco Suárez; and (III) Pythagorean or Galileian model (see Schmitt 1976; Poppi, and Zen Benetti 2010; Forlivesi 2011, 2014, 2018). In 1630, he died in Padua.

Falloppio, Gabriele

Born: c. 1523, Modena

Died: October 9, 1562, Padua

Joel A. Klein

Columbia University, New York, NY, USA

Abstract

Gabriele Falloppio was one of the most distinguished Italian anatomists and physicians of the sixteenth century. He made multiple significant discoveries, for instance, regarding the anatomy of the internal ear and of the reproductive organs, but also was consequential in the development of the genre of anatomical *observationes*.

Alternate Names

[Falloppia](#); [Fallopius](#)

Biography

Gabriele was born in Modena to Caterina and Girolamo Falloppio, and while some biographers

suggested that the family was noble, this conclusion is unlikely (Favaro 1928). Girolamo worked first as a goldsmith and then as a soldier, and some sources suggest that his latter employ involved criminal endeavors in service of rulers in Modena. Regardless, it is reported that he contracted syphilis, perhaps on an expedition to Naples, and died when Gabriele was approximately ten, leaving his family practically destitute. Gabriele received a humanist education, but upon the financial difficulties resulting from the death of his father, was guided toward an ecclesiastical education and career. When his family's fortunes began to recover he took up the study of medicine and anatomy in Modena, and it is possible that he later spent some time in Padua studying with Giambattista da Monte and Realdo Colombo, Vesalius's successor. It is certain that he studied in Ferrara with Antonio Musa Brasavola and Giambattista Canano.

Falloppio became the chair of pharmacy in Ferrara before accepting the chair of anatomy at the University of Pisa in 1549. After a lengthy affair in which he was accused of practicing human vivisection, he was appointed the chair of anatomy at Padua, succeeding Realdo Colombo, and taking a post that had been made particularly famous several years earlier by Andreas Vesalius.

Falloppio's career in Padua reached its zenith with the publication of his *Observationes anatomicae* (1561), which contained various comments and observations on Vesalius's *De humani corporis fabrica* (1543) based on Falloppio's own anatomical investigations. While the *Observationes* was not a comprehensive textbook on anatomy, it contained numerous discoveries and challenged many earlier notions, albeit in a relatively conciliatory fashion.

Having dissected adult, juvenile, and infant human bodies, Falloppio was able to describe the ossification of parts of the skull, the sternum, and the centers of the hipbone. Falloppio's account of the anatomy of the internal ear superseded that of Vesalius, and likewise he provided an important description of the muscles of the scalp and face, most notably the extraocular muscles of the orbit, as well as the extrinsic muscles of the ear. He also garnered some fame for his

description of the clitoris and for coining the word “vagina,” but his name, of course, came to be associated with the uterine tubes, which he carefully described, and which are now referred to as the Fallopian tubes. Falloppio’s diverse observations were based not only on dissections but also on his extensive clinical practice and experience with patients.

Beyond its contributions to the particulars of human anatomy, Falloppio’s *Observationes* inaugurated an important subgenre of medical writing, anatomical *observationes*, which highlighted case-studies and became particularly influential in the seventeenth century. These anatomical *observationes* were, as Gianna Pomata has argued, a part of the larger epistemic genre of medical *observationes*, which emerged in Renaissance humanistic medicine (Pomata 2010, 2011).

Many texts attributed to Falloppio were published posthumously and were based on lecture notes taken by students. These are concerned with subjects ranging from mineralogy and balneology to surgery and pharmacy, and while O’Malley concluded that they likely represent the original content of the lectures, he notes that the popular *Secreti diversi et miracolosi* (1563) that is attributed to Falloppio is spurious (O’Malley 1981).

Farel, Guillaume

Born: 1489, Gap, France

Died: 13 September 1565, Neuchâtel, Swiss Territories

Theodore G. Van Raalte

Department of Ecclesiology, Canadian Reformed Theological Seminary, Hamilton, ON, Canada

Abstract

Guillaume Farel initiated and advanced religious reform in the French-speaking Swiss cantons, starting c. 1524. From 1538 to his death in 1565, Farel served as the leading pastor of the Reformed Church in Neuchâtel. Together with Pierre Viret (1511–1571) in Lausanne and Jean Calvin (1509–1564) in Geneva, he is regarded as one of the three great reformers of the Swiss territories. All of them worked closely with – at first against – the local city councils.

Biography

Born in 1489 in the southeast of France, in Gap, Farel came late to theological studies. He earned his Master of Arts in Paris in 1517. This degree opened the way for Farel's sometime teacher, the French humanist Jacques Lefèvre d'Étaples (1455–1536), to obtain for him a teaching position at the Collège du Cardinal Lemoine, attached to the University of Paris. According to Farel's own account, he began to see the need for reform in the church late in this period of his life (Farel 1530, 175; Zuidema and Van Raalte 2011, 72–74).

In 1521, Farel joined Lefèvre at Meaux to assist the reforming bishop Guillaume Briçonnet by lay preaching within the parish. This circle of reformers enjoyed the patronage of Marguerite of Navarre (Reid 2009, 1:185, 243–47). After a royal decree prohibited this work in Meaux, Farel preached around France, but after little success joined Oecolampadius and other reformers in Basel in 1524. Here, he instigated a formal disputation; he argued in 13 theses about Christ's words forming the only rule for doctrine and practice in the church (Comité Farel 1930, 122–123). Banished later that year, he was welcomed to Montbéliard by its duke, preaching there until October 1525. Then he worked in Strasbourg with Bucer, Lefèvre, and others, until November 1526.

Farel wrote his first evangelical French language treatise in 1524 – a prayer book on the Lord's Prayer and Apostles' Creed, partly dependent on Luther's (Farel 1524; Zuidema and Van Raalte 2011, 103–116). Soon after, the beginnings of liturgical forms in French appeared from his hand (Comité Farel 1930, 141; Zuidema and Van Raalte 2011, 191–223; Farel 1533). Possibly as early as 1529, Farel also produced the first evangelical confession in French, his *Summaire*, and in 1532 a treatise on the Lord's Supper (Farel 1532; Desrosiers-Bonin and Kemp 2007, 1:9; Zuidema and Van Raalte 2011, 117–190). After the Bern Disputation of 1528, Farel became an emissary of Bern, preaching throughout the Pays de Vaud with that city's protection (Bruening 2005, 35–37). Between 1526 and 1533, Farel preached in many Swiss cities, such as Aigle, Bienne, Erguel, Neuchâtel, Orbe, Grandson, and Morat,

witnessing the adoption of reform in many (Comité Farel 1930, 173–284). For example, on 4 November 1530, due in large part to Farel's persistence, the Neuchâtel bourgeoisie voted to abolish the mass and follow the way of reform. Here, from 1533 to 1535, the printer Pierre de Vingle joined Farel, printing early Reformed works in French (Desrosiers-Bonin and Kemp 2007).

Farel was also key to Geneva's reformation. The Genevans rudely kicked him out in 1529, and sent him away again in 1532 in spite of Bern's letter of protection. However, he preached openly at the end of 1533, publicly debated Guy Furbity in 1534 and Pierre Caroli in 1535, and, with the help of Antoine Froment and Pierre Viret, helped convince Geneva's *citoyens* to swear to follow reform on 21 May 1536 (Desrosiers-Bonin and Kemp 2007, 1:205–215; Comité Farel 1930, 298–337). The military campaign of Bern through the Pays de Vaud also played a large part in Geneva's decision (Bruening 2005, 39–41).

In 1532, Farel attended a Waldensian synod, helped unite them to the Reformed churches, and received 500 gold écus from them to support a new French translation of the Bible from the original languages, which was completed by Olivétan (Comité Farel 1930, 291–97).

On 10 November 1536, Farel recruited yet another young man to serve as pastor in one of the cities that Farel had led in reform – the famous Jean Calvin, in Geneva. Shortly after, Farel wrote Geneva's first Reformed confession of faith and church order articles (Farel 1536; Stam 2000). In 1538, Calvin, Farel, and Courauld were banished from Geneva, but Calvin agreed to return in 1541 (Speelman 2014, 89–142). Farel became the leading pastor of the Reformed Church of Neuchâtel from 1538 until his death in 1565 (Comité Farel 1930, 421–728). He became deeply involved in promoting reform in the key city of Metz from 1542 to 1545 (Farel 2009) and travelled as needed to preach in other places such as his hometown of Gap in France (Comité Farel 1930, 701–708), but otherwise primarily cared for the church of Neuchâtel.

Farel was known for his persistence, relentless energy, impetuosity, verbosity, and earnest spirituality (Zuidema and Van Raalte 2011, 4–5,

31 ff.). In Neuchâtel, Farel preached four sermons each Sunday and three on other weekdays, a total of seven sermons per week, about 350 per year, and perhaps well over 12,000 in his lifetime. Recognizing some of his own weaknesses, he urged Calvin to write treatises against the Anabaptist Libertines. Both of them countered the attacks of Pierre Caroli in the 1540s. As friends who belonged to what has been called the renaissance “republic of letters,” these two men on average exchanged a letter per month for decades.

In 1558, the itinerant Farel appeared perhaps ready to settle down: to the embarrassment of his colleagues, he married the daughter of his deceased housekeeper, a 17-year-old girl. They received one child who died young, 3 years after Farel (Comité Farel 1930, 673–80). His body was interred in the Saint-Guillaume chapel in Neuchâtel. Farel has been commemorated by public statues in both Geneva and Neuchâtel.

Heritage and Rupture with the Tradition

Farel taught in broad agreement with the Reformed confessions such as the Theses of Berne (1528), his own *Summaire* (1528, 1534, 1542), his own *Confession de foi* (1536), Calvin’s Geneva Catechism (1537), and the French churches’ *Confession de foi* (1559). In 1542, when reissuing his *Summaire*, he highly recommended Calvin’s *Institutes* as a biblical and clear exposition of doctrine (Zuidema and Van Raalte 2011, 187). His view of the Lord’s Supper may have evolved from an earlier Zwinglian position to a later Calvinist position, but he did not simply parrot the arguments of others (Jacobs 1979).

Innovative and Original Aspects

Farel’s emphasis on the use of prayer as a means to teach doctrine is somewhat unique among the reformers and in sharp contrast to prevailing church practices prior to the Reformation (Zuidema and Van Raalte 2011, 56–62). Like the European reformers generally, he emphasized the

use of the vernacular in religious discourse and published all his works but two in French. A high view of the glory of God, ample admittance of human sin, and stark contrasts between good and evil mark all his writings. Farel also highlights God’s self-love as ground for his grace (Zuidema and Van Raalte 2011, 95). Farel appears to have introduced to French Protestantism the Reformed liturgical element of the *sursum corda*, i.e., “let us lift up our hearts to the Lord” (Zuidema and Van Raalte 2011, 5–6). Frequent communion and congregational singing also appear to have been Farellian ideas prior to Calvin (Zuidema and Van Raalte 2011, 6–7, 85).

Fate, Renaissance Concept of

Valentina Zaffino

Faculty of Philosophy, Pontifical Lateran University, Rome, Vatican City State

Abstract

The term fate (*heimarmenē* in Greek, *fatum* in Latin) can be understood in different ways. Ancient tradition sometimes likened it to the idea of chance (*tyche*) to signify the unfathomable force that governs cosmic events. On a more strictly philosophical level, fate indicated the unfailing causal order regulating the course of events. This order was at times identified with divine providence itself or as its subordinate, depending on whether the existence of a supernatural causality had been accepted. The concept of fate also has logical and ethical implications. It involves the possibility of moral conduct and mankind's responsibility for it. These themes were associated by Christianity with the issue of divine grace and human predestination, both of which were extensively discussed during the Renaissance. It was at this time that several authors turned their attention to the subject of fate and its opposite, the theme of mankind's freedom. Therefore, the debate over fate is first and foremost part of the wider discussion over predestination and free will, which was based on an ancient and late antique legacy that acquired a distinctly religious meaning with Erasmus of Rotterdam and Martin Luther. The debate mainly concerned how human behavior affected the soul's eternal salvation and the role Christ's grace played in the process. The issue of predestination was also crucial in the theological controversies that led to the Protestant Reformation in the sixteenth century. In addition, Renaissance philosophers argued over whether cosmic influences affected human events and whether the planets governed human life by affecting bodily fluids. This debate had a remarkable

impact on the early modern age, especially on Hobbes, Spinoza, Leibniz, Locke, Hume, and the French Enlightenment.

Synonyms

Determinism; Necessity; Predestination

Heritage and Rupture with Tradition

For the Greeks, fate was represented by the Moirai (the Roman Parcae), a group of female deities who spun the thread of each person's life, an image which was often recalled in Renaissance iconography. The literary genre of tragedy had a paradigmatic way of presenting the Greek view of human life as the subject of blind chance (*tyche*) and its dominance over helpless mankind. Plato did not agree with this view: instead, while recounting the myth of Er, he affirmed man's independence from fate, since *aitia* (indicating both responsibility and guilt) always belongs to the person who chooses rather than to the deity who tries to affect human events (*Republic*, 617E). Plato, however, seemed to believe that this choice is made once and for all when the soul descends into the body and selects which of the three parts into which the soul is divided (reason, spirit or appetite) will determine the course of its future life. The goal of human life is happiness, which according to Plato coincides with the chief good and, as far as possible, assimilation to God. Even though the purpose of human life is pre-determined, individuals are free to decide the means by which they will pursue it, and this decision depends on which part of the soul it chooses.

The debate over Aristotle's position on fate is controversial, since he does not appear to be specifically interested in the topic, except in *Physics* II.4-6. Modern critics, who shared Alexander of Aphrodisias's quarrel with the determinists, regarded Aristotle as an indeterminist philosopher. During the Renaissance, too, this reading of Aristotle was led by the interpretation

put forward by the School of Padua. Aristotle's doctrine of the four causes was viewed as a confrontational response to Stoic determinism; thus, the human intellect's self-determination was seen as the foundation of its own freedom. In late antiquity, by reporting the thought of the Middle Platonic philosopher Atticus, Eusebius of Caesarea associated Aristotle with Epicurus, accusing both of being atheists in denial of God's providence or divine intervention in human events (*Praeparatio evangelica*, XV.5.14).

Hellenistic schools and Christian philosophy systematically dealt with the issue of human freedom and, along with the Platonic and Aristotelian traditions, significantly influenced the Renaissance debate. By moving away from the determinism of ancient atomists, Epicurus introduced the theory of the *clinamen* or swerve; he also reduced the role of logical and ontological necessity and left mankind a wide margin of self-determination. But it was the Stoics who paid most attention to fate, which they viewed as a physical concept, that is, something belonging to natural philosophy, the logical and ethical implications of which were only consequences. For the ancient Stoics, the *logos*, which was immanent in the cosmos, guaranteed the self-determination of the cosmos itself. *Heimarmenē* was the rational necessity of divine law (*pronoia*) which guided the life of the living cosmos in a finalistic manner and according to a providential plan. Stoics saw fate as an ineluctable "chain of causes", the necessary development of *logos* in its function as the producer and ruler of the cosmos (*Stoicorum Veterum Fragmenta*, II, 912–951). They believed each event to be preceded by one or more antecedent causes, which necessarily and providentially produced a specific given effect instead of another.

In late antiquity, Middle Platonism preserved the worth of human freedom and separated the concept of fate from that of providence. Thus, Calcidius, whose commentary on the *Timaeus* influenced the Renaissance Neoplatonist tradition, stated that providence preceded fate and was a superior cause to it, marking its boundaries of fate and favoring mankind's self-determined action.

With the rise of Christian philosophy, divine providence replaced blind fate, and Renaissance thought reinterpreted these concepts in both a mystical and a theological-philosophical sense. First and foremost, Renaissance mysticism – drawing on medieval and Oriental traditions – affirmed mankind’s freedom to make decisions about its own eternal salvation; and it placed the height of human freedom in the rapture of participation in and total surrender to God’s will. This can clearly be seen, for example, in Nicholas of Cusa, who drew inspiration from Pseudo-Dionysius, Eriugena, and Meister Eckhart. Furthermore, in response to the Gnostic heresy, the Greek Church Fathers Clement of Alexandria and Origen maintained that the only true knowledge was that which enabled one to discover the divine and providential order that governs the world. Ethical development coincided with intellectual fulfilment: God has endowed mankind with a free intellect, which is capable of reaching intellectual unity with him. These themes would be evoked by Giordano Bruno in the sixteenth century.

Augustinian reflection on free will and divine grace was the focal point of the Renaissance religious debate which was introduced by Erasmus and Luther. Augustine, who was at odds with Pelagianism, separated divine prescience from predestination: Predestination does not compel the human will, even though God has known man’s will forever. Augustine also separated free will from freedom. Free will was the chance to welcome God’s grace through the Church, that is, the opportunity to choose between good and evil. Human freedom, on the other hand, was the *actio* (action) of the *velle* (volition) dictated by free will, that is, the possibility of making a choice with the *auxilium gratiae* (assistance of grace).

Renaissance reflection on free will and freedom was also influenced by Thomas Aquinas, who viewed human beings as free to determine their own choices, just like God, who created them in his own image and likeness. Nevertheless, Thomas believed that intellect was joined by rational appetite (*voluntas*), which always pushed man towards his ultimate object, the universal good; by following the intellect’s activity,

therefore, will was free to determine itself and pursue the goal chosen by the intellectual faculty.

Innovative and Original Aspects

At the end of the fourteenth century, Coluccio Salutati wrote *De fato et fortuna* (On Fate and Fortune), a treatise which, by citing ancient opinions on free will, was responsible for opening the Renaissance debate on the subject. During the Renaissance, the theme of chance was first and foremost approached on an astrological level, even though this had already been done in antiquity. Judicial astrology was viewed as a means of forecasting human events, since the arrangement of planets and stars was believed to be the cause of all occurrences. Human physiology and physiopathology were thus believed to be a consequence of the effects planets had on bodily fluids (for instance, in the theories of humorism and of the four elements developed by Hippocrates and Galen).

Opposing this strictly determinist attitude was, among others, Giovanni Pico della Mirandola. Based on the *Corpus Hermeticum* (see *Asclepius*, 6), he celebrated man as a *magnum miraculum* (great miracle), who had the freedom to determine his own fate, which made him ontologically superior in dignity to all other created beings; he was also free from the influence of stars, as Pico argued in his *Disputationes adversus astrologiam divinatricem* (Disputations against Divinatory Astrology). In his *De hominis dignitate* (On the Dignity of Man), Pico (2012) presented man as the object of his own nature, but also as a subject, since he is able both to embrace it and to act on it according to his will. Man, he claimed, is an “intermediary” between heaven and earth, and between God and nature. Mankind thus possesses ontic freedom (liberty to do) and ontological freedom (liberty to be) whatever he chooses. The basis of these arguments was the *De dignitate et excellentia hominis* (On the Dignity and Excellence of Man) by Giannozzo Manetti, which anticipated Pico’s anthropological themes in the same vein as Ovid, Lactantius, and Augustine. Manetti also evoked the *homo faber*

image, which was absent in Pico but which would be important for both Marsilio Ficino and Tommaso Campanella.

By contrast, Giordano Bruno's ethical views were decidedly elitist. In the *Spaccio de la bestia trionfante* (Expulsion of the Triumphant Beast), he was openly opposed to Luther's doctrine of justification by faith alone, seeing industriousness as mankind's greatest virtue. It is responsible for life after death, just as in metempsychosis the soul is subject to rewards and punishments. In *De gli eroici furori* (The Heroic Frenzies), Bruno identified three types of frenzy and found that only the heroic frenzy enabled contemplation of the truth, that is, the unity of the universal whole. This condition – which the philosopher believed himself to possess – was shared by only a few individuals who reached it by exercising virtue but also by natural talents God himself gave them.

Niccolò Machiavelli, on the other hand, saw fortune as the series of events that are not subject to human will and are thus unpredictable and determined, while human virtue only intervenes within his own range of action, thus leaving room for free will. Such differentiation was reaffirmed by Pietro Pomponazzi: by recognizing that philosophy is incapable of proving the immortality of the soul, he reinterpreted the Stoic (and later, Christian) concept of providence affecting man's will in *De fato, de libero arbitrio et de praedestinatione* (One Fate, Free Will and Predestination). From a cosmological and natural point of view, in *De naturalium effectuum causis sive de incantationibus* (On the Causes of Marvelous Natural Effects or On Incantations), Pomponazzi reflected on the events that seem not to abide by the laws of nature and denied they might have super-sensible causes, thus reducing all events to natural astrological causes that are nevertheless impossible for mankind to grasp. These causes abide by hard-and-fast rules that compel God himself, who acts on events only in an indirect manner, through the celestial bodies, which, in turn, have a direct effect on the cosmos and human events.

Furthermore, during the Renaissance, the theme of predestination was one of the main subjects of theology proper and was almost always discussed

in relation to St Paul's letters: the question was no longer man's earthly fate, but rather his eternal fate, the outcome of the merits and guilt earned in this life (according to some), or the result of divine grace alone (according to others). Lorenzo Valla's *De libero arbitrio* (On Free Will) criticized philosophers who, because they took an intellectual approach to the problem, were unable to grasp the divine mystery of salvation of the predestined. Nicholas of Cusa, too, following the Neoplatonist Augustinian tradition, often referred to "God's predestined", in the belief that every man, as a *simulacrum Dei* (likeness of God), is destined to join the Principle of which he is an imperfect copy that still needs grace in order to reach eternal life. In manifesting canonical church doctrine, Nicholas stated: "*Homo liber est in arbitrio, et eligere potest viam iustitiae et paenitere de peccatis*" ("Man is free in his will and can select the path of justice and repent his sins", Nicholas of Cusa 2004: 380; *Sermo CXCI.8.4-6*).

The issue of predestination acquired a crucial historical role with Erasmus of Rotterdam's *De libero arbitrio* (On Free Will, 1524) and Martin Luther's *De servo arbitrio* (On the Enslaved Will, 1525). Their debate contributed to the separation between Rome and the Reformed churches, and the subsequent Catholic Counter-Reformation promoted by the Council of Trent. Erasmus was in line with the Platonic tradition in considering the human soul separable from the body, and he interpreted this tradition in the light of St Paul's letters. Mankind's bodily nature was tainted by original sin, while its spiritual nature strived toward God and was thus inclined to good, since Christ's grace saves humanity from sin and gives it new freedom. Humans experience a choice between vice and virtue, and the decision will determine their eternal life, since they are solely responsible for their own salvation or damnation. They cannot rely on their will alone, as it is incapable of moving the action and, most of all, moving it towards good. It is grace that gives humans a desire for the good, and it also allows them to pursue it; but the space of human freedom is inviolable and inescapable, since mankind autonomously determines its own contingent acts and ultimately its own eternal fate.

Luther responded to Erasmus's work by affirming that man's natural freedom is enslaved by sin; thus, the human will is incapable of striving toward the good, as it is hampered by man's corrupt nature, which unavoidably makes him sin again and again. In order to gain salvation, actions are useless: the only means is God's grace, which comes from Christ's sacrifice. By interpreting Paul's *Letter to the Romans*, Luther affirmed that redemption was a divine act, the outcome of grace and faith in justification through God. The actions of humans are thus merely the result of the condition to which they are predestined: those who have been saved will necessarily perform good deeds, while the damned will always behave sinfully.

Impact and Legacy

Renaissance reflection on the theme of fate was to leave behind an important legacy in the early modern era. From the seventeenth century onwards, following the scientific discoveries (especially in the field of astronomy), philosophy was confronted with scientific determinism and Cartesian mechanism, which also dealt with human passions, viewed as predictable due to the cause-effect ratio that caused them.

Hobbes's anthropology, for example, denied all forms of spontaneous causation, and French organicist materialism during the Enlightenment (La Mettrie, Diderot, Helvétius and d'Holbach) reaffirmed this view by involving ethical positions, along with strictly naturalistic ones, and openly challenging Christianity.

As opposed to Descartes's ontological dualism, Spinoza introduced radical monism, according to which thought and extension do not subsist autonomously but are rather attributes of the same substance. Ideas and bodies, which are modes of these attributes, are a necessity of the causal sequence proceeding from God. Contingency is thus denied, since God, the one and only free cause, is immanent in the Whole, which is irrevocably governed by the laws of matter. Unlike finite entities – which are compelled by some necessity – Divine substance is

necessitated by itself, by its own nature (God is *causa sui*): this self-determined necessity is therefore the only possible form of freedom.

Even though between the seventeenth and eighteenth centuries, the determinist view found supporters, many still backed human free will, including Samuel Clarke, who affirmed the freedom of indifference of both God and man, though the latter was decidedly weaker. Moreover, Leibniz, despite presenting a determinist view of preestablished harmony, defended the monads' freedom of action, by separating determination and necessity and distinguishing between contingency-necessity and determination-necessity. He also re-interpreted the Aristotelian concept of spontaneity by seeing it as a complete exclusion of the external determination of the monad, which was nevertheless subject to strong internal determination (Kant would refer to such spontaneity as the "freedom of the turnspit").

On an empirical level, on the other hand, philosophers underlined the freedom for humans to do whatever they want but not the freedom to desire whatever they want. Thus, the will is not free, but action is, even though it is always determined by the will and by the human mind. Locke and Hume, therefore, transformed Renaissance determinism into psychological determinism.

Fernel, Jean

Born: c. 1497, Montdidier, France

Died: 26 April 1558, Fontainebleau, France

John Henry

Science Studies Unit, University of Edinburgh, Edinburgh, UK

Abstract

Jean Fernel was one of the leading physicians and medical writers of his age, who not only set out compendious synoptic accounts of Galenic theory for the first time but also offered his own major reforms of medical theory in order to deal with contagious and other infectious diseases (which were not adequately dealt with in ancient medicine). He stands, therefore, alongside Paracelsus (1493–1541) and Girolamo Fracastoro (1483–1553), as the only would-be medical reformers of the sixteenth century.

Alternate Names

[Fernelius, Johannes](#)

Biography

Fernel was born at Montdidier (near Amiens) but raised in Paris from the age of 12. After taking an MA in 1519 at the Collège de Sainte Barbe, of the University of Paris, he turned down the immediate offer to teach dialectic there and embarked instead on a rigorous course of autodidacticism. He developed such a profound interest in mathematics that he considered mathematics alongside divinity and

jurisprudence as possible careers. He decided upon medicine, however, because his love of solitude made him unsuited to the public performance required in law and in the church, and mathematics had no clear opportunities. Fernel taught philosophy at the Collège de Sainte Barbe while pursuing his MD, but he also published his first works at this time: three short mathematical treatises.

Fernel achieved his doctorate in 1530, but he continued his autodidactic course, particularly in mathematics. Fernel's devotion to mathematics absorbed much of his time and money, to the detriment not only of his medical studies but also of his recent marriage. Fernel's wife and his father-in-law, a senator of Paris, finally prevailed upon him to give up mathematics and concentrate on medicine (Henry 2011).

He now embarked on his chosen career in earnest. After 6 years of teaching Hippocrates and Galen at the Collège de Cornouailles, he was forced to stop teaching to concentrate on his burgeoning practice; but he also now embarked on writing the major medical works for which he became renowned. His reputation was so high by 1542 that he was summoned by Prince Henri (1519–1599) to treat the serious illness of his mistress, Diane de Poitiers (1499–1566). Believing that Fernel saved his beloved mistress's life, Henri wanted to appoint Fernel his physician-in-chief. Fernel managed to avoid this obligation until 1556, when he finally ran out of excuses and became royal physician for the last years of his life. At first, Fernel believed this post would allow him more time to pursue his studies, away from his crowding patients, but war with Spain and England rudely intervened. Fernel in his sixties had to march with the army. When he returned to court at Fontainebleau, he fetched his wife from Paris, but after a few days there, she developed a fatal illness. Fernel was overwhelmed by the death of his wife and was himself taken ill and soon followed his wife to the grave. It is recorded that before he became a royal physician, his practice generated an annual income that often exceeded twelve thousand French pounds and rarely fell below ten (Sherrington 1946, p. 170).

From Mathematics to Medicine

Fernel's three mathematical treatises mark his early efforts to forge a career for himself in mathematics. *Monalosphaerium* (1527) was a description of a new mathematical instrument (based on the astrolabe). *Cosmotheoria* (1528) included Fernel's description of how he measured the distance on the ground of a degree of latitude (accurate to within 0.8 percent of today's value), and *De proportionibus libri duo* (1528) was a simple instructor on proportions (Henry 2011).

The transition to medicine, however, would not have been a major wrench in intellectual outlook. On the contrary, medicine and mathematics were closely affiliated in his day. An obvious association occurred through the juxtaposition of astronomy and astrology and the taken-for-granted assumption that astrology was useful in prognosis. The *Monalosphaerium* includes material on "critical days" in fevers and the effect of the lunar cycle and the motions of the zodiac on medical matters. It also gives instruction in casting horoscopes. In the *Cosmotheoria*, Fernel suggests that even the sphere of the *primum mobile*, which he agrees is starless, exerts an occult influence on earth. Given these interests, it is hardly surprising that Fernel's first medical work should also draw heavily upon astrological theory. It was a major premise of the *De abditis rerum causis* (*On the Hidden Causes of Things*, written around 1538, although not published until 1548) that many of the phenomena of life derive from a nature in things which corresponds in some way to the nature of the stars and that there is a "celebrated heavenly power, diffused into the whole universe, [which] makes its way right into the remotest recesses of the earth, penetrating the most close-knit and solid bodies" (Fernel 2005, Book I, Ch. 8, p. 313) (Henry 2013).

Fernel, Reformer of Medical Theory

The *De abditis rerum causis* was a major study of the nature of contagious and pestilential, or epidemic, diseases which seemed anomalous

according to ancient theory. Fernel's new theory was closer to what historians of medicine, following Owsei Temkin (1977), call an *ontological* concept, rather than a *physiological* concept of disease. Hippocratic and Galenic theory saw all disease in terms of a disturbance of the patient's four humors such that the normal healthy temperament (the balance of the humors in the body) was disrupted. It follows from this that diseases do not have a separate existence in their own right. It was recognized, of course, that diseases can be characterized and can be seen to have their own specific natures: scabies is easily distinguished from rabies, for example. But for the Hippocratic or Galenic physician, the nature of disease remains rooted in disturbance to normal human physiology. The difficulty with this individualistic physiological approach to sickness, seeing every illness as the special problem of one patient, is that it cannot easily explain conditions which seem to be infectious. Why should one patient's physiological disruption be capable in some cases of being passed on to others with different constitutions or temperaments? The difficulty is especially severe for Galenic theory in the case of epidemic diseases, such as plague. Infectious diseases, especially epidemic ones, strongly seem to suggest that diseases have a kind of life of their own; they seem to be real, distinct entities, which can pass from one person to another. It was the increasing prominence of this kind of disease which led some thinkers to develop an ontological theory of disease.

Fernel did not reject humoral pathology but saw his own theory as an extension of ancient theory, an addition to it, specifically for dealing with infectious, and pestilential conditions, as well as what he calls "poisonous diseases" (by which he meant those bodily disturbances brought about by those poisons which evidently do not operate by upsetting the balance of the humors). This was written up in the form of a Ciceronian dialogue in *De abditis rerum causis* and was already finished by 1538, but withheld from the press.

Fernel decided that before publishing his refinement, or addition, to the standard medical theory, he should clarify what he took to be the full

extent of the standard medical theory. By 1538, therefore, he had already begun writing *De naturali parte medicina* (*On the Natural Part of Medicine*), which was published in 1542 and which offered a compendious account of the structure, powers, and functions, of the healthy human being. Fernel subsequently appropriated the term *physiologia* (which then signified the study of nature in general) as the title of this work and so gave rise to the modern usage of "physiology" as the study of living systems.

The *Physiologia* was extremely useful and made Fernel one of the most renowned medical writers of the day. Its importance lay in the fact that it was the first serious attempt to present the prevailing assumptions about the nature of the human body, which underlay the Renaissance system of medical theory, in a comprehensively synoptic way. The medical theory of Fernel's day was based mostly on the eclectic system of medicine propounded by the prolific Hellenistic physician and philosopher, Galen of Pergamum (129–199 AD). Galen's own accounts were fragmented and diverse; accordingly, they were taught to medical students through the summary and commentary provided in the *Canon* of the Persian polymath, Avicenna (980–1037) (Siraisi 1987). So, there was no systematic treatment of physiology until Fernel's. Accordingly, the *Physiologia* is probably the fullest and most clearly organized exposition of Renaissance Galenism that was ever written and represents the high-water mark of European Galenism. Its appearance also coincided with changes in demand for published works. During the Renaissance, the systematic textbook came to be seen as a more useful commodity than the commentaries on ancient authorities and the compilations of *Quaestiones* which had been more typical in the medieval period. One way and another, the *Physiologia* was a book which made its author's reputation (Fernel 2003).

Fernel followed this up with would-be comprehensive surveys of pathology (*Pathologia*), and therapeutics (*Therapeutice*), and gathered all three together in the compendious *Medicina* (1554). It seems likely that Fernel intended to withhold the *De abditis rerum causis* until after the appearance

of this full survey of all of ancient medicine, but in the event, he published it after the *De naturali parte medicina*, in 1548. It is possible that he decided to publish at this time as a result of the publication of Girolamo Fracastoro's *De contagione* in 1546, which also offered a new theoretical understanding of contagious diseases (Fernel 2005). After Fernel's death, the *Medicina* and *De abditis causis* were included together in his *Universa medicina* (1567).

On the Hidden Causes of Things (1548)

De abditis rerum causis is divided into two parts. The first is concerned with the natural philosophy of generation, or animal reproduction, and the means by which the soul enters into a newly created human. The second part is concerned with three sorts of "hidden disease," which is to say, diseases with hidden causes: "poisonous, contagious, and pestilent." The linking factor between these two parts is the role of the stars or the heavens. Fernel argues that the stars do not send any material substance down to earth, but they can send down a part of their power which can then work on correctly organized and constituted bodies to make those bodies produce within themselves life and a soul or in pathological circumstances one of the "hidden diseases" (Fernel 2005, Henry 2013).

All three kinds of hidden disease present the standard physiological concept of disease of the Galenic tradition with severe difficulties. The unvarying pattern of such diseases, so that all patients irrespective of type or temperament respond in essentially the same way, seemed to offer evidence that the physiological view of disease, based on an individual's humoral imbalance, was misconceived. Consequently, Fernel offered his own alternative account. Diseases of these types were held to act, not on the humors but on what Fernel called the "total substance" of the body. The "total substance" seems to be equivalent to the scholastic notion of substantial form, and it is not clear why Fernel did not simply call it that. Perhaps it was simply because he did not want to become involved in contemporary debates

about the validity and usefulness of the concept of substantial form.

The diseases with hidden causes were all held to act by means of some occult power. The model for all of them was essentially disease caused by poison. A substance entering the body from outside, either through a bite or a wound, or simply through contact with the skin (and the ability to soak through), or by ingestion or inhalation, could wreak havoc in the healthy body and could work with such immediacy that it was impossible to believe that it acted through an accumulation of corrupt humor, which would have been required on the precepts of humoral pathology. A poison is a material thing, but by working immediately on the whole body, it was considered to work by occult means. It was not such a big step, therefore, to claim that pestilential diseases were caused by the occult influence of the stars. The stars did not send anything material to earth, but merely transmitted part of their power, which could then enter into the body and cause it to break down, analogously with the way a poison caused the body to break down. A poison has an occult power, and the stars have occult powers.

The problem with this theory, of course, was that its recourse to occult qualities and powers would have been dissatisfying to many of his readers – no better than a confession of ignorance (the position later satirized by Molière when he made a doctor in one of his plays pompously intone that opium puts patients to sleep because of its occult "dormitive virtue"). Consequently, Fernel devoted much of the *De abditis causis* to explaining as fully as he could what these particular occult qualities or powers were, where they come from, where they reside, and what they could do (Hirai 2002). It is evident, however, that Fernel did not believe that his arguments about these matters were sufficient to persuade all his contemporaries, and as a consequence, another major effort of the book is directed to justifying in more general terms recourse to occult powers. One aspect of this was to throw doubt on the validity of the distinction between so-called manifest qualities (hot, cold, dry, and wet) and occult qualities (Fernel 2005). Another was to extol the virtues of empiricism as a way of

discovering the operations of occult qualities and processes (Henry 2013). Fernel also drew extensively upon two influential aspects of the occult tradition: astrology and alchemy. Interestingly, his use of alchemy to help make his case was taken up in turn by contemporary alchemists who used Fernel's views to bolster alchemical theory (Matton 2002). It is these nonmedical aspects of the book which made it a major contribution not just to medical theory but also to current natural philosophy.

Impact and Legacy

During, and immediately after, his own lifetime, Fernel was immensely influential. As one of the prime movers in the development of theories suggesting an ontological, as opposed to a physiological, view of disease, Fernel's works attracted a lot of attention. One reason for his success, among his contemporaries, was the modest way in which he introduced his reforms – often seeking to show that his innovatory ideas can either be found in, or at least can be seen to emerge from, the works of Aristotle and Galen. This contrasted sharply with the iconoclastic approach of Paracelsus and his followers, whose dismissal of Aristotle and Galen seemed to contemporaries to be not just arrogant but also absurd (since everyone knew that the works of Aristotle and Galen were “tried and true” and had been for hundreds of years). Fernel did not reject Aristotle and Galen but seemed to want to build from their works, extending and refining them (Hirai 2005). His influence upon his contemporaries was at least as great as Fracastoro's, and rivalled that of Paracelsus, particularly among more conservative thinkers.

Even so, Fernel has failed to attract the kind of attention from historians accorded to either Fracastoro or Paracelsus. Perhaps this lack of interest stems from the fact that Fernel's theory of occult diseases has no easy association with modern ideas. On the face of it, Fernel seems less interesting than Fracastoro, because Fracastoro's seeds of disease can easily be likened to “germs,” while nothing in Fernel's works seems to prefigure

modern ideas (Hirai 2002). On the contrary, because Fernel's ideas were bound up with Renaissance theories of the occult, they have been treated by his modern commentators, until very recently, with some embarrassment. It is important, however, to judge Fernel's theories according to the standards of his own time. Fernel's explanations, drawing heavily upon supposed occult properties, were controversial, but they were not regarded as in any way absurd or ridiculous. Indeed, the Renaissance was a time of reassessment of the validity of the notion of occult qualities, and Fernel's claims about occult diseases undoubtedly fed into that wider debate.

Ferrari, Ottaviano

Born: 1516 in Milan

Died: 1586 in Milan

Beatrice Variolo

The Johns Hopkins University, Baltimore, MD, USA

Abstract

Ottaviano Ferrari, an Aristotelian philosopher, and doctor, was born in Milan in the first half of the sixteenth century. He taught moral philosophy at the Scuole Canobiane of Milan, before teaching Logic in Pavia for 4 years around 1548. Returned to Milan, he lived there until his death, where he was part of the cultural elite of the Lombard city. While his lessons on Aristotle's *Ethics* and many of his notes are still manuscript, Ferrari published three works. Two of them, *De Disciplina Encyclo* (Ferrari O, *De disciplina encyclo liber, ad L. Annibalem Cruceium*.

Paolo Manuzio, Venice, (1560)) and the *De Sermonibus Exotericis* (1575), are thought as introductions to the study of Aristotle. The third one, *De Origine Romanorum*, published posthumously in 1588, is concerned, instead, with the history of ancient Rome.

Biography

An Aristotelian philosopher and doctor, Ottaviano Ferrari was born in Milan in 1516 and died there in 1586.

Ferrari studied eloquence, philosophy, and medicine in the most renowned Italian universities, although there is no precise indication about which universities he attended. It was mistakenly thought that Ferrari lectured in Peripatetic philosophy at the University of Padua, where he was called by the Aristotelian scholar Francesco Vimercato. A letter of his close friend Jacopo Bonfadio and the presence of his name on the list of professors for the year 1548 clearly indicate that Ferrari was, instead, professor of Logic at the University of Pavia. From 1554, Ferrari taught moral philosophy and politics in Milan's Scuole Canobiane, founded in 1553 by Paolo Canobio, whose curriculum was built on the teaching of metaphysics and Christian ethics (Verri, 17). From the exam of the still manuscript lectures on the ten books of Aristotle's *Ethics*, it emerges that Ferrari considers the study of moral philosophy as a preliminary stage to prepare the mind to contemplation. Ferrari objects to Thomas Aquinas' conflation of Christian doctrine and Aristotelian philosophy but could not avoid the saint's influence. The titles of the numerous and still unpublished notes, kept in the Biblioteca Ambrosiana of Milan, attest to a particular interests in Aristotle's *Politics*, *De Anima* and *Ethics* (*In primum et secundum Librum Politicorum Aristotelis; In primum, secundum, tertium Aristotelis De Anima; In I, II, III et IV Ethicorum Aristotelis; In Ethicorum Aristotelis Libros V, VI, VII et VIII; In Ethicorum Aristotelis Libros IX et X*). Other manuscripts are devoted to more general topics of moral and natural philosophy (*De Instrumento ac morali virtute, et unde oriatur*;

Quaestio de Scientiae Naturalis utilitate, et de generatione virtutum moralium; Quaestiones de Vacuo). Among Ferrari's autographs, it is also listed a *Censura in I Caput variorum Lectionum Marci Antonii Mureti*, addressed to the French humanist Marc Antoine Muret, professor of moral philosophy in Rome and one of the last to uphold the link between rhetoric and ethics.

Ferrari had been teaching at the Scuole Canobiane for 18 years and enjoyed a great intellectual and personal success in Milan. He had many famous students; among them the doctor Ludovico Settala, remembered by Alessandro Manzoni in *The Betrothed*.

Ferrari was known for his clear and elegant speech that earned him the nickname of "second Aristotle" (Sangiorgio, 210). His great fondness for the Greek philosopher is confirmed by a medal, attributed to Annibale Fontana, which portrays on one side the profile of Ferrari, on the other of Aristotle.

Most of his private life can be inferred from the correspondence with the printer Paolo Manuzio, son of Aldo, and Giulio Poggiano, one of the most important Latinist of the Counterreformation. In a letter addressed to the latter in 1567, Ferrari confirms that he studied medicine, but confessed that he decided not to practice because it is a discipline that requires a continuous application.

Manuzio, instead, published in 1560 Ferrari's first book, the *De disciplina encyclo* (*On the encyclopedic discipline*). Dedicated to the Milanese nobleman Annibale Della Croce, this work discusses the union of knowledge as the necessary foundation to approach the study of Aristotle. Fifteen years later, in 1575, Ferrari published the *De sermonibus exotericis liber* (*Book on the exoteric speeches*), in which he examines philological problems connected to the genesis and structure of the *Corpus Aristotelicum*.

His most famous book is not concerned with Aristotelian philosophy, but with Roman history: *De origine Romanorum* (*On the origin of the Romans*), published posthumously in 1588 by Andrea Viani. Tiraboschi, in fact, includes Ferrari among the most important ancient historians of the sixteenth century. This book accurately

reconstructs the Roman history from its inception, carefully drawing on a vast number of Greek and Latin authors. Praised for his extensive knowledge of ancient sources, and in spite of the more than occasional oversights, Ferrari's *De origine Romanorum* is considered one of the most important attempts to dispel the fabrications of Annio da Viterbo's *Antiquitatum Variarum*.

Abstract

Antonio De Ferraris (1444/48–1517), known as Galateus, practiced as a physician at the Aragonese court in Naples and joined the Accademia Pontaniana. He combined broad humanistic scholarship with a wide knowledge of scientific disciplines, including medicine. He had a broad philosophical background. His letter *De educatione* acquired a certain importance due to its description of ancient and contemporary systems of education.

Alternate Names

[Galateus](#)

Biography

Antonio De Ferraris (1444/48–1517), known as Galateus, was born in Galatone (Salento). He graduated in medicine in Ferrara in 1474, practiced as a physician at the Aragonese court in Naples and joined the Accademia Pontaniana, also in Naples, where he changed his name to Galateus after the town of his birth. Galateus alternated his residence between Naples, Gallipoli, and Lecce. While in Naples he certainly came into contact with the intellectuals gravitating around the Aragonese court. Among his contacts were Giovanni Pontano, Benedetto Gareth, Paolo and Giovanni Attaldi, Giovan Francesco and Galeazzo Caracciolo, Giovanni Pardo, Fra'

Roberto da Lecce, and Jacopo Sannazaro. In the decade of 1470–1480, Galateus lived more permanently in Salento. In 1490 he once again returned to Naples, where he associated with Pontano. Galateus spent his last years between Gallipoli and Lecce. He died in Salento on November 12, 1517 (Antonaci [1970](#); Corsano [1970](#); Vallone [1970](#); Tateo [1989](#); Zacchino [2009](#); Dall'Oco and Reggio [2019](#))

Heritage and Rupture with the Tradition

His philosophical background included Aristotle, Plato, Euclid, Avicenna, and Averroes. His polemic with Coluccio Salutati on the dignity of medicine is particularly relevant. Salutati, in his *De nobilitate legum et medicinae*, had criticized the scholastic approach to knowledge, particularly the interpretation of medical knowledge embodied by Pietro d'Abano and the Arab physician Avicenna. Almost a century later, in his *De dignitate disciplinarum ad Pancratium*, De Ferraris supported the thesis of the nobility of medicine, referring, in direct contrast with Salutati, to the same philosophical presuppositions of d'Abano that were advocated in Ferrara by the physician and philosopher Michele Savonarola (De Ferraris. [1947](#); Verardi [2013](#)).

Innovative and Original Aspects

His letter *De educatione* expresses hope of a restoration of the Neapolitan branch of the House of Aragon. The precepts contained in this work are not very different from the usual advice found in humanistic literature, but Galateus' attempt to outline a description of ancient and contemporary systems of education acquired a certain importance. He was not slow to criticize the Spanish works that were starting to circulate in Italy, considering them as having a "corrupting" influence on morality. De Ferraris even expresses a favorable opinion of the severe treatment of the female sex by the Turks, contrasting it with Spanish corruption as a vehicle for obscenity and other immoral behavior (pederasty, deceitfulness, and narcissism).

His deep piety and morality, distrust of the false idols of good government and disdain for the degeneration of Christianity were given space not only in his *Lettere*, but also in his extensive commentary on the *Pater Noster* (De Ferraris 1504). This highly unique work harks back to the monastic tradition that had flourished greatly in Apulia and is written in a coarse and sharply eloquent vernacular. De Ferraris scorned the literary model of the Tuscan language and made conscious use of dialectal forms. The commentary is preceded by a justification of the variety of dialects, based on the example of Greek, in contrast to the “Tuscanization” of the Italian language pursued by the “literati” (Vallone 1970; Zacchino 2009, Dall’Oco and Reggio 2019).

In his work *De situ Japigiae*, Galateus provides a detailed description of the uses, customs, and places of Salento. The work contains criticisms of vulgar superstitions, against which he proposed to do battle, providing his readers with rational explanations of phenomena wrongly considered by people to be supernatural (De Ferraris 1868, 2005; Verardi 2018).

Impact and Legacy

De Ferraris manages to combine broad humanistic scholarship with a wide knowledge of scientific disciplines, including the practice of medicine.

The exaltation of his Greek origins and the use of the Salentine vernacular are elements that make Galateus an emblematic author of the Salentine culture. This exaltation of his origins will ensure him a significant impact among local scholars until the twentieth century (Zacchino 2009).

Ferreira, António

Born: Lisbon, Portugal, 1528

Died: Lisbon, Portugal, 1569

Thomas Earle

University of Oxford, Oxford, UK

Abstract

António Ferreira was a Portuguese poet and dramatist whose work, written entirely in Portuguese, is representative of the High Renaissance in Portugal. He was educated at the University of Coimbra, at a period when it was open to foreign influence. Later he moved to Lisbon where he became a judge. His work demonstrates clearly the clash of

competing ideologies in the Renaissance. Especially in his Senecan tragedy, *Castro*, Ferreira shows the difficulty of maintaining a consistently Stoic philosophical stance in the face of adversity. In the same work, he shows himself to be aware of the classical and especially Senecan concept of a deterministic fate, but he rejects it, so that the catastrophe of *Castro* becomes the consequence of ill-considered moral choices made by a number of characters.

In 1598, many years after his death, the final version of the tragedy was published, in a volume, entitled *Poemas Lusitanos*, which also contained Ferreira's collected lyric poetry. In this large body of verse, he rejects entirely the medieval poetic tradition of Portugal. However, his classicism was tempered by his Christian faith. In his odes, for instance, the evocation of a pastoral landscape in the Greco-Roman tradition is tempered by the need for Stoic restraint and a Christian concern with proper preparation for the inevitability of death. Yet his Stoicism, too, is subject to an awareness of his own human failings, such as the fear of the consequences of speaking too openly in an increasingly intolerant and oppressive society.

Biography

António Ferreira was born into a family in the service of the Dukes of Aveiro. Probably through the influence of his father's employer, from around 1543 to 1555/56 he was able to study at the University of Coimbra, at a time when it was open to foreign influence and before it had come under exclusively clerical control. After obtaining his doctorate, he entered the royal service in Lisbon, becoming a *desembargador* (judge) before his relatively early death, from plague.

Works

Ferreira was a poet and dramatist, not a philosopher, but his work demonstrates very clearly the clash of competing ideologies in the Renaissance.

He wrote two comedies in prose (*Bristo, ou o Fanchono*, 1562, and *Cioso*, 1622) as well as a verse tragedy, *Castro* (1587), his best-known work. A revised version of the tragedy and an extensive collection of lyric poetry were published together as *Poemas Lusitanos* in 1598.

Heritage and Rupture with the Tradition

Like his predecessor, Francisco de Sá de Miranda (1487–1558), Ferreira attempted to use the Portuguese language in all the poetic genres practiced in classical antiquity, rejecting entirely the medieval verse tradition (*Carta a D. Simão da Silveira*, Book II, 10). At the same time, as heir to the Iberian Stoic tradition of the later Middle Ages (Blüher 1983), he sought to combine the aesthetic with the moral, in this following in the footsteps of Horace (Weinberg 1961). However, he was acutely aware of the difficulties of putting Stoic precepts into practice. In addition, his leaning towards the aesthetic and philosophical tradition of ancient Rome was tempered by his orthodox Catholic faith. His works for the stage are notable for their strong, even dominant female characters, in a way which reverses the misogynous tradition of mediaval Iberia (Archer 2005).

Innovation and Original Aspects

In the tragedy *Castro*, Ferreira followed the model of Seneca's works for the stage for its structure and for some aspects of characterization. However, he found Seneca's deterministic fate incompatible with his Christian faith and the catastrophe is driven by the moral failings of the characters, no one of whom is solely responsible for the course of events. As a consequence, a complex web of causality is established. The principal character, Castro herself, owes something to the heroines of the sacrificial dramas of antiquity and of the playwrights of Ferreira's own time (Buchanan, *Iephtes*). However, unlike them, she does not accept her fate passively, and in the climactic Act IV persuades the king to rescind the death sentence which he had

pronounced against her. Her arguments are driven by a Stoic confidence in her own virtue, but she rejects *ataraxia* and wins the day by an appeal to pity. She thus dominates the stage and the male characters entirely. Only when she has left does the king change his mind and order her execution (Earle 2012).

The best of Ferreira's lyric poems also bring into sharp relief the intellectual conflicts so vividly dramatized in the tragedy. In the *Odes* (especially Book I, 7 and Book II, 5), the evocation of a classical landscape is contrasted with a need for Stoic restraint and a Christian consciousness of impending death. In the verse *carta* (letter) to the poet Diogo Bernardes (Book I, 12), Horatian moral and aesthetic precepts are tempered by a wholly unStoic fear of the consequences of speaking freely in an intolerant and oppressive society.

Impact and Legacy

The posthumous publication of the *Poemas Lusitanos*, written exclusively in Portuguese, helped to promote the national literature during the 60 years of Spanish rule in Portugal (1580–1640). However, Ferreira's classicism did not appeal to the baroque taste of the seventeenth century and his works were not republished until 1771. More recently, *Castro* has frequently been edited and performed.

Fibonacci, Leonardo

Born: Pisa, 1160/70

Died: Pisa, after 1241

Gunthild Peters

Max Planck Institute for the History of Science, Berlin, Germany

Abstract

Innovative mathematician or representative of a tradition? Although Leonardo Fibonacci is considered one of the most important exponents of medieval mathematics, his originality, his expertise in knowledge originating from Arab and Latin environments, and his influence on the medieval Italian writings on the *abbaco* remain controversial.

Synonyms

[Fibonacci](#); [Leonardo of Pisa](#); [Pisano](#), [Leonardo Bigollo](#)

Biography

There is little evidence of Leonardo's life. A charter of 1226 establishes him as procurator for his brother in the purchase of real estate and in 1241 his hometown began to pay him an annual salary for administrative counseling. His date of birth is estimated on the basis of the dates of his writings.

Leonardo himself said that his father Guglielmo had called him to Bugia (Bejaïa, Algeria) to study calculation with Indian-Arabic numerals and that he improved his mathematical skills during business travels around the Mediterranean. It follows from Leonardo's writings that he had close contact to the court of Frederick II during the emperor's stay in Pisa in July 1226 and to associate scholars, for example, Michael Scotus and Giovanni of Palermo.

Writings and Sources

The *Liber abaci* (1202, revised 1228) is a unique collection of mathematical problems. It begins with an introduction to the positional system and to calculation with Indian-Arabic numerals (without an abacus). The textbook presents many problems concerning trade (e.g., price of goods, calculation of interest, partnerships) and includes an elaborated section on algebra (see Boncompagni (1857) and Sigler (2002)). Leonardo collected mathematical knowledge also from Arabic sources of the ninth and tenth centuries that were probably available in Latin translation.

The *Practica geometriae* (ca. 1220) is dedicated to problems of measurement, with or without instruments (e.g., perpendicular, quadrant, at sight), and to theoretical geometry (see Boncompagni (1862) and Hughes (2008)). One of its main sources is Plato of Tivoli's *Liber embadorum*.

Leonardo's shorter writings *Liber quadratorum*, *Flos*, and *Epistola ad Magistrum Theodorum* deal with various problems, for example, in algebra and number theory (see Boncompagni (1862) and Sigler (1987)).

A commentary on Book X of Euclid's *Elements* concerning irrational magnitudes and a treatise on commercial arithmetics *Liber de minore guisa* have not been preserved.

Innovative and Original Aspects

The originality of Fibonacci's *Liber abaci* did not lie in the use of Arabic numerals, which was not new in Europe at that time, but rather in the breadth of its sources and the compilation of many examples resulting from his experience in trading. Leonardo presents innovative ideas in his shorter treatises, for example, the *Liber quadratorum* where he solves problems by combining algebra with Euclidean arithmetic in a way not found in other writings so far. Leonardo's creativity and proficiency may be estimated more adequately when further research provides more details concerning Arab textual traditions and their transmission.

Impact and Legacy

Since the beginning of the thirteenth century, a large number of vernacular abacus books have appeared in Italy. The texts focus on commercial arithmetics and reflect a teaching tradition in the *abbaco* schools for merchants. The extent to which abacus books refer to Leonardo's work remains an open question. Leonardo's achievements were later acknowledged by talented mathematicians such as Luca Pacioli in his *Summa de arithmetica* of 1494 and by Girolamo Cardano in *Ars magna* of 1545. Only in the nineteenth century did researchers first begin to undertake thorough investigations into Fibonacci's texts.

► Academy, Platonic

Ficino, Marsilio

Born: 19 October 1433, Figline Valdarno, Italy

Died: 1 October 1499, Florence, Italy

Denis J.-J. Robichaud

Program of Liberal Studies, University of Notre Dame, Notre Dame, IN, USA

Abstract

This brief entry is on Marsilio Ficino (1433–1499), the most famous Platonic philosopher of the Renaissance. It provides a brief biography for Ficino and introduces readers to

essential features of his Platonic scholarship, commentaries, and philosophy.

Biography

Marsilio Ficino, the son of Dietefeci d'Agnolo da Figline and Alessandra di Nannoccio da Montevarchi, was born on 19 October 1433 in Figline Valdarno. Having lived in and near Florence through the rediscovery of what must have seemed like countless textual and antiquarian treasures from the ancient world, wondrous developments in the arts and sciences, and the invention of the printing press but also violent plagues and regime changes by the Medici, Savanarolans, and republicans, as well as wars with the papacy, a French invasion, and explorations of the new world, he died on 1 October 1499, as one of the most famous philosophers of his times (Della Torre 1902; Kristeller 1937–1945, 1938, 1988; Marcel 1958; Vasoli 1997; Celenza 2017).

Ficino's father, Dietefeci, worked as a physician for the Medici and ensured that the young Ficino not only learned traditional medicine but also was educated in novel humanist programs in Florence. The details of Ficino's early educators are not completely certain, but he received a humanistic education in *grammatica* under the tutelage of Luca d'Antonio de' Bernardi di San Gimignano and Comando Comandi, and he might also have learned Greek from Francesco da Castiglione and scholastic philosophy and theology from Antonio degli Agli, Lorenzo Pisano, and Niccolò Tignosi (Della Torre 1902; Kristeller 1944, 1988; Marcel 1958; Gentile 1990; Field 1998; Hankins 1990a; Vasoli 1997; Celenza 2017; Lines 1990; Robichaud 2016a). There is some debate whether Ficino studied at the University of Bologna (Della Torre 1902; Kristeller 1944; Marcel 1958; Vasoli 1997), but in any case, he was also trained in natural sciences, medicine, and astrology. Ficino was long thought to have organized a Platonic Academy of Florence (or Careggi) (Della Torre 1902; Field 1998, 2002), but the nature of Ficino's "Academy" has been reinterpreted as nothing more than a metaphor for his Plato manuscript (Hankins 1990b, 1991). Ficino's contemporary, Benedetto

Colucci, employed the expression “Academiae princeps” to describe Ficino’s role as an instructor of youths, and “academy” also seems to denote Ficino’s informal Socratic conversations (Celenza 2007, 2017). Ficino himself also employs the term “academia” as a prosopopoeic image to describe various philosophers that constitute Platonic traditions of philosophy and hermeneutics (Robichaud 2017a). Ficino did in fact also hold official paid teaching positions. He briefly taught at the Florentine *Studium* (Davies 1992) and was a private instructor of youths in Florence and at the Camaldolese order (Davies 1992; Celenza 2017). Regarding the physical site where Ficino worked, he did in actual fact receive a home on S. Egidio in Florence along with Platonic manuscripts in 1462, as well as a small villa in Careggi in 1463 as gifts from Cosimo de’ Medici (Marcel 1958; Field 1998; Gentile et al. 1984; Hankins 1990b; Vasoli 1997).

Ficino devoted himself at a very young age to becoming a man of letters, a scholar, and a Platonic philosopher and theologian. Powerful patrons supported Ficino throughout his life, often paying for the costs of printing his many works, but Ficino also owned family properties in Montevarchi, Figline, and in the parish of S. Leo a Celle, and lived on ecclesiastical benefits. He received earnings from the chapel of S. Maria della Neve a Montevarchi as early as March 1470 (1469 in the Florentine dating system). He became parson of S. Bartolomeo a Pomino in Fiesole in January 1473, was ordained as a deacon in December, and soon thereafter became rector of the church of S. Cristofano a Novoli in January 1474. Ficino later became a canon of the Florentine Cathedral of Santa Maria del Fiore in November of 1483, and it does not seem like he pursued an opportunity to become a bishop (Kristeller 1937–1945, 1938, 1985; Gentile et al. 1984; Vasoli 1997).

Ficino enjoyed the close company of the cultural elite of Florence, including, to be brief, Cristoforo Landino, Giovanni Pico della Mirandola, Angelo Poliziano, and Lorenzo de’ Medici. He was also well acquainted with mercantile, political, diplomatic, and religious leaders and with such important families as the Medici,

Valori, Salviati, Bembo, Cavalcanti, Soderini, and Rucellai. Although his network of correspondents, which included humanists, philosophers, theologians, poets, artists, physicians, scientists, monks, churchmen, businessmen, Popes, princes, and Kings, stretched across Europe, Ficino seems to have spent his life in Florence and Tuscany. However, as a central node to a philosophical Republic of Letters, Ficino’s intellectual life extended far beyond the walls of Florence and its surrounding countryside.

Heritage and Rupture with the Tradition

Translations and Commentaries

Marsilio Ficino’s philosophy is closely intertwined with his work as a scholar, translator, and commentator. He is of course rightfully celebrated as the first person to translate Plato’s complete works into Latin. Ficino translated a first collection of ten dialogues (*Hipparchus*, *Amatores*, *Theages*, *Meno*, *Alcibiades I and II*, *Minos*, *Euthyphro*, *Parmenides*, and *Philebus*) for Cosimo de’ Medici in 1464. He then seems to have finished a first draft of his translation of Plato’s complete works as early as 1469, which he first printed in 1484 at an auspicious astrological moment (Ficino 1990–2010; Hankins 1990a; Robichaud 2017c).

It is also known that after translating the first batch of ten Platonic dialogues, Ficino turned his attention to translating Hermetic dialogues into Latin, which he published under the title *Pimander* (Kristeller 1937–1945; Ficino 2011a). Ficino’s early translation of Hermetic texts also signals his long-standing interest in pagan religious sapiential texts, which he understood as parts of traditions of ancient theologies and that he expressed as a lineage of ancient spokespersons, as we read in his *Pimander*, Hermes, Orpheus, Aglaophamus, Philolaus, and Plato, or in his later lists, Zoroaster, Hermes, Orpheus, Aglaophamus, Pythagoras, and Plato. Ficino translated other texts from these traditions early on, including the Pythagorean *Symbola* and *Aurea verba*, as well as the lengthy tomes of Iamblichus’s *De secta Pythagorica*, which includes a large collection of (Pseudo-)

Pythagorean fragments (Kristeller 1937–1945; Walker 1972; Gentile 1990; Hankins 1990a; Allen 1998; Ficino 2011a; Celenza 1999; Toussaint 2014a, b; Robichaud 2016b, 2017a). Only fragments of Ficino’s translations of the *Orphic Hymns* and the *Oracula Chaldaica*, which Ficino considers Zoroastrian, survive as quotations in various works (Klutstein 1987). Ficino also claims to have translated a number of ancient works of poetic theology in his youth: “Argonautica et hymnos Orphei et Homeri et Proculi, Theologiamque Hesiodi... adolescens, nescio quomodo, ad verbum mihi soli transtuli” (Klutstein 1987; Robichaud 2016a).

In addition to Proclean *Hymns*, which he claims to have cast into the flames, Ficino also translated Proclus’s *Elements of Theology* and *Elements of Physics* (Robichaud 2016a) again in his youth. Along with these early translations of Proclus, as well as his aforementioned Latin version of Iamblichus’s *De secta Pythagorica*, early on, Ficino also translated a number of other Platonic texts into Latin, including Theon of Smyrna’s *Mathematica* and Hermias’s commentary on Plato’s *Phaedrus* (Kristeller 1937–1945; Allen 1980; Sheppard 1980; Gentile 1990; Robichaud 2016b, 2017a). His ambitious translation projects continued late in life. He produced partial or complete translations of many other Neoplatonic texts, which he published with a number of other Platonic works at the press of Aldus Manutius in 1497: Iamblichus’s *De mysteriis*; Proclus’s *In Alcibiadem*; Proclus’s *De Sacrificio et magia*; Porphyry’s *De divinis atque daemonibus*; Synesius’s *De somniis*; Psellos’s *De daemonibus*; Priscianus Lydus’s *In Theophrastum de sensu, phantasia et intellectu*; Alcinous’s *De doctrina Platonis*; Speusippus’s *De definitionibus*; and Xenocrates’s *De morte*. Ficino circulated Latin translations of excerpts of Proclus’s commentary on Plato’s *Republic* in 1492, soon after Janus Lascaris arrived in Florence with a manuscript copy of this work (Robichaud 2016a). The list of Ficino’s translations is even longer than this already impressive catalogue. In the 1480s and early 1490s, Ficino translated all of Plotinus’s *Enneads*, along with Porphyry’s *De vita Plotini* (Kristeller 1937–1945; Förstel 2006; Robichaud 2016a, 2017b, c; Ficino 2017–2018), and in the 1490s, he

produced a full translation of Pseudo-Dionysius’s *De mystica theologia* and *De divinis nominibus* (Kristeller 1937–1945; Toussaint 1999; Ficino 2011b, 2015). He even tried his hand at vernacular translations, notably by producing Tuscan versions of Dante’s *Monarchia* (Ficino 2004) and his own *De amore*, i.e., his dialogic commentary on Plato’s *Symposium* (Ficino 1956, 1984, 1985, 1994, 1996, 2002b).

Ficino’s contributions to the history of philosophy can also be measured by his prolific work as a commentator on the works he translated. Ficino’s first major effort as a Platonic exegete is the set of introductory *argumenta* that accompany the collection of ten dialogues he translated for Cosimo de’ Medici. With these commentaries and the preface that accompanies them, Ficino became the first philosopher since antiquity to interpret Plato’s dialogues as a unified corpus. Ficino orders and interprets the ten Platonic dialogues according to a Neoplatonic series, whereby the order of dialogues aims to turn the reader away from the desire of wealth and worldly things to the love of wisdom, virtues, and human nature and finally toward the one and the highest good, in order to make him, following the famous dictum from Plato’s *Theaetetus*, become like God as much as possible. Inspired by Iamblichean Pythagoreanizing Platonism, Ficino caps off the series by including the Pythagorean *Aurea Verba* and *Symbola* (on Ficino’s work on these ten dialogues, see Kristeller 1937–1945, 1966; Marcel 1958; Hankins 1990a; Toussaint 2013; Robichaud 2017a).

Ficino elaborated on these exegetical strategies as time went on. To develop his own philosophical hermeneutics, he studies in detail a number of works of Greek Platonists like Plotinus, Porphyry, Iamblichus, Hermias, Proclus, Olympiodorus, and Damascius, as well as Latin Platonists like Boethius and Calcidius, but also earlier so-called Middle Platonists like Alcinous and Albinus – Ficino attributes the works of both to Alcinous (Robichaud 2017a) – as well as Theon of Smyrna and Numenius of Apamea and later biographical and doxographical works like Diogenes Laertius’s *Lives of Philosophers*. Given the fact that Ficino’s readings of ancient Platonism were dependent on

Byzantine manuscripts, it is also not surprising to learn that Ficino read works of Byzantine Platonism (or Byzantine critiques of Platonism) including by Michael Psellos, Nicholas of Methone, Nicephorus Gregoras, Gemistus Pletho, George of Trebizond, and Cardinal Bessarion (Monfasani 2002).

Ficino developed a prosopopoeic interpretation of the Platonic corpus, arguing that Plato adopts different *personae* for philosophical purposes, for example, a Socratic *persona* to refute Sophists and encourage youths to pursue a philosophical life and Pythagorean *personae* to formulate mythologies or put forward elaborate metaphysics and cosmologies. It is only in the *Laws*, the *Epinomis*, and the *Letters* that Plato speaks in his own *persona*, adopting a style of writing that Ficino argues begins to resemble later Neoplatonists. According to Ficino, therefore, these later Platonists did in fact inaugurate a new stage of Platonism but a stage that returned to a Platonism that was closer to Plato's original message (Allen 1998; Robichaud 2017a). Ficino's Platonic commentaries largely take the form either of short *epitomes* and *argumenta* or in the case of a few dialogues, namely, the *Philebus* (Ficino 2002a), the *Phaedrus* (Allen 1981, 1984), the *Timaeus*, and the *Parmenides* (Ficino 2012a, b) longer commentaries (see also Leinkauf 2014; Hankins 1990a; Robichaud 2017a). Although on occasion Ficino includes philological or historical material in these commentaries, he largely conceives of them as philosophical exegesis. In other words, there is no impenetrable line demarcating Ficino's roles as a scholar of Platonic works from his status as Platonic philosopher.

This is clear most of all in Ficino's original commentary on Plato's *Symposium*, the *De amore*, which he finished in 1468. In the *De amore*, Ficino restages the dramatic conversations and speeches from Plato's banquet. Ficino imitates the structure of the *Symposium* by casting a friend to interpret each of the seven speeches in Plato's dialogue. Ficino plays with prosopopoeia to produce a dialogic and imitative commentary on Plato's famous work. Ficino translated his Latin *De amore* into Tuscan (Ficino 1987), and

the work was widely influential on Renaissance aesthetics, works of art, poetics, and philosophies of love (Festugière 1941; Ficino 1956, 2002b; Kraye 1994; Robichaud 2017a).

In the 1480s, Ficino wrote other commentaries on Neoplatonic texts including Priscianus Lydus's own commentary on Theophrastus's *De sensu, phantasia et intellectu* but also importantly on Plotinus's *Enneads*. Ficino finished translating Plotinus in early 1486 and completed his commentary on the work in August 1490. He later revised and printed it in 1492. Ficino's philological work on the Greek manuscripts is careful and precise, and his commentary is just as sophisticated, with respect both to Ficino's reconstruction of Plotinus's thought in difficult passages and to Ficino's own philosophical responses to Plotinus's work (Kristeller 1937–1945; Förstel 2006; Robichaud 2016a, 2017b, c; Ficino 2017–2018; Gersh 2019). Once again, we notice how the hermeneutical boundaries between Ficino's work as textual interpreter and as philosopher merge, especially insofar as recent scholarship has confirmed that the third book of Ficino's *Three Books on Life* (the *De vita coelitus comparanda*) originated as an exegesis of Plotinus's *Enneads* 4.4.26–45 (Ficino 2002c; Kristeller 1937–1945; Walker 1958; Garin 1960, 1976; Yates 1964; Klibansky et al. 1964; Copenhaver 1984, 1986; Weill-Parot 2002; Robichaud 2017b).

Ficino read more ancient Platonism than any of his contemporaries, but he was also an astute student of a number of Church Fathers and scholastic doctors, including Clement of Alexandria, Basil of Caesarea, Eusebius, Origen, Athanasius, and Thomas Aquinas. Augustine's own debts to Platonism ensure his special place in Ficino's studies, though Ficino repeatedly challenges the Bishop of Hippo's censures of the Platonists (Allen 1998; Robichaud 2014, 2017a). One finds a constant motivation to understand Christianity's relationship to pagan Platonism in Ficino's work. This is remarkably evident, for instance, in his translation of and commentaries on Pseudo-Dionysius the Areopagite's *De mystica theologia* and *De divinis nominibus*. Just as in his commentaries on Plotinus, Ficino's commentaries on the

Corpus Dionysiacum are precise and complex. He deploys a rich array of ancient Platonic sources to understand Pseudo-Dionysius and to realign his theology with ancient Platonic traditions (Toussaint 1999; Ficino 2011b, 2015). Ficino spent his final hours of scholarship commenting on St. Paul (Ficino 2018), since it was this author, as perhaps nearly all of Medieval Christianity believed, who taught the Athenian convert Dionysius the mysteries with which he composed the earliest source of Christian theology.

Innovative and Original Aspects

Writings

In addition to being one of the greatest Renaissance Hellenists and philosophical exegetes, Ficino also wrote a number of important works, any one of which would have been enough to earn him widespread recognition in his day. Ficino was a precocious philosopher, and fortunately, many of his youthful writings survive. A number of texts reveal that Ficino worked in a “scholastic background,” as Kristeller famously put it (Kristeller 1944). Still, Ficino’s writings before 1456 already demonstrate his early penchant for Platonism: *Invectiva Marsilii Fighinensis ad suum Ghuardavillam Volaterranum*, *Summa philosophiae Marsilii Ficini ad Michael Miniatensem*, two different *Tractatus physicus*, *Tractatus de anima editum per Marsilium*, *Quaestiones de luce et aliae multae Marsilii*, *Divisio philosophiae*, and *De voluptate* (Kristeller 1944; Vasoli 1997; Gentile 1983, 1990; Robichaud 2016a; Ebgi 2019). However, one important piece of writing seems to have been lost, namely, his youthful *Institutiones ad platoniam disciplinam*, which he presented to Cristoforo Landino and Cosimo de’ Medici in 1456, both of whom encouraged the young philosopher to devote himself to mastering the Greek language to read ancient philosophy in the original. A number of other important works that survive from this period, including the *De divino furore*, the *De deo et anima*, the *De virtutibus moralibus*, and the *De quatuor sectis philosophorum*, demonstrate that even before Ficino became the fifteenth-century expert on Greek Platonism, he had already begun to define the goal of

Platonism as becoming like God (Gentile 1983; Robichaud 2017a).

Ficino’s *De amore* has been rightly considered as Ficino’s first major work of philosophy. It enshrined Ficino’s status in his day as a master of ancient Platonism. Ficino continued to write a number of short philosophical and theological tracts. Many of these, including the *Disputatio contra iudicium astrologorum* and the *De sole*, *De lumine*, and *Orphica comparatio solis ad deum*, pertain to questions of optics. Ficino’s studies in this field take the form of metaphysical, cosmological, astrological, and geometric explanations (Ficino 1981, 2008; Sorokina 2015).

Ficino was also highly innovative in his use of letter writing as a means to circulate short works, like the *De raptu Pauli*, which he sent as letters to friends, fellow philosophers and theologians, and patrons (Ficino 1975–2015, 1990–2010). His letters frequently engage in philosophical dialogue with his contemporaries. Even the shortest playful notes are often filled with prompts to engage in philosophical self-knowledge (Robichaud 2017a). Ficino eventually printed twelve books of collected correspondence in 1495, but his letters had by then circulated in manuscript to the four corners of the burgeoning Republic of Letters. Although he never abandoned circulating his works in manuscript, Ficino was also very quick to employ the new technology of the printing press for his philosophical projects. For example, Ficino composed a new philosophical biography for Plato, the *De vita Platonis*, on which he first lectured, in all likelihood c. 1469, before including the work in his epistolography c. 1477–1478, and finally placed it as an introduction to his printed translation of Plato’s complete works in 1484 (Allen 1977; Toussaint 2004; Robichaud 2006; Podolak 2011).

Between c. 1468 and 1474, Ficino was in the throes of writing his eighteen-volume magnum opus, the *Theologia Platonica de immortalitate animorum*. The first four books of *Theologia Platonica* contains a summa of metaphysics, psychology, and cosmology (Kristeller 1988; Ficino 2001–2006, 2007; Robichaud 2020). In book five, Ficino begins his demonstrations for the immortality of the rational soul. The *Theologia*

Platonica contains a number of important arguments against Averroes, Alexander of Aphrodisias, and Epicureanism. Concerning the latter, it should be noted that Ficino was the first Renaissance philosopher to engage systematically with Lucretius's *De rerum natura*, famously rediscovered by Poggio Bracciolini in 1417. Ficino even recounts that he was briefly under the spell of Lucretian Epicureanism in his youth and wrote *commentariola* on the poem (Snyder 2011; Gentile 2013; Hankins 2013). The *Theologia Platonica* draws heavily on Greek, Latin, and Arabic (which Ficino read in Latin translations) philosophy. Its publication is a major moment in the history of philosophy that signals Ficino's renewed attempts to reintegrate Greek sources for ancient and late ancient Platonism into philosophical and theological thinking about the rational soul.

Ficino also published another important work of theology in 1476, his *De Christiana Religione* (Ficino 2019). The work seeks to explain providential nature of Christianity and draws heavily on the Bible, Church Fathers and Doctors, and ancient philosophers and historians. It is worth noting that a group of Ficino's religious sermons have been recently edited and bear witness to Ficino's activities in religious communities in and near Florence (Vasoli 2003; Ficino 2014).

In 1478–1479, Florence was hit with the plague. Ficino took care of patients and wrote a medical handbook in the vernacular, the *Consilio Contro la Pestilentia*, which he printed in 1481. The work is filled with practical medical knowledge, and Ficino refers to some of the most revered ancient and medieval authorities, in Greek, Arabic, Latin, and vernacular medical traditions, including Aristotle, Hippocrates, Galen, Avicenna, Averroes, Avenzoar, Rhazes, and the Italian physicians Tommaso del Garbo and Gentile da Foligno. The work became one of Ficino's many best sellers and well read well into the eighteenth century (Katinis 2007).

Another work of philosophical medicine (albeit unconventional medicine), the *De vita libri tres*, was also a great success. It was printed in over thirty editions and translated into numerous languages between 1489 and 1647 (Ficino

2002c). The *De vita* is in fact much more than a work of medicine. It is also a foundational work for Renaissance theories of saturnine melancholy and genius, philosophy, theology, astrology, image theory, talismans, magic, music, and prayers – to keep the list short. The third book in particular, the *De vita coelitus comparanda*, originates in Ficino's commentary work on Plotinus but further develops a number of Ficino's interests in the *Hermetica*, celestial influence, and Iamblican religious theurgy to produce fascinating synthesis of his religious and philosophical thinking (Ficino 2002c; Celenza 2002; Robichaud 2017b).

Impact and Legacy

The huge impact of Ficino's Platonic scholarship and philosophical writings, especially on metaphysics, cosmology, psychology, and theology, is difficult to assess in few words. Ficino's famous early modern readers include the likes of Diaceto, Marcello, Bruno, Campanella, Copernicus, Kepler, Liceti, Cardano, Nifo, Erasmus, Colet, Cambridge Platonists, Agrippa, Montaigne, Rabelais, Lefèvre d'Étaples, and Gianfrancesco Pico. They serve as witnesses to the fact that Ficino's texts often found themselves on the period's bookshelves, especially of thinkers either interested in Platonism or in criticizing Platonism.

Before Ficino arrived on the scenes, Latin readers in the West had access to too few Platonic works to understand and appreciate Plato and later Platonists fully. The *Meno*, the *Phaedo*, and parts of the *Timaeus* and the *Republic* and, famously because of William of Moerbeke, the *Parmenides* were translated into Latin before the fifteenth century, but these manuscript, however important they certainly were, would not have been nearly as widely available as Ficino's translations. There were, of course, humanist translations of Plato before and after Ficino. Ficino consulted some of his predecessors, for instance, Leonardo Bruni's translation of the *Phaedrus* and George of Trebizond's translation of the *Laws*. But Ficino's feat was altogether different. He

approached Plato's works as a corpus, and he was one of the few scholars in his day who was highly skilled in ancient Greek and had access to the Greek manuscripts of Plato's works. The publication of his translation of the Platonic corpus, which circulated widely in manuscript and especially in print, ensured that generations of philosophers, scholars, theologians, and artists were able to study Plato's thought. Ficino's scholarship was contested but never completely replaced in the early modern period. The famous Bipontina edition of 1781–1787 continued to publish a corrupted version of Ficino's translation (Neschke-Hentschke 2008; Robichaud 2016c). Even August Immanuel Bekker's important critical edition of the Platonic corpus continued to publish Ficino's Latin translation along with the Greek text, ensuring that Ficino's Plato continued to be read widely into the nineteenth century (Hankins 1990a; Robichaud 2016c, 2017a). One can draw similar conclusions about the legacy of Ficino's Latin scholarship on Plotinus. Georg Friedrich Creuzer's 1835 critical edition of the *Enneads* was the only complete version of Plotinus to appear after Ficino's edition printed by Petrus Perna in 1580, but Creuzer's own edition of the Greek text also includes Ficino's translation, commentaries, and preface (Robichaud 2018).

Figo, Azariah ben Ephraim

Born: Venice, 1579

Died: Rovigo, 1647

Beatrice Variolo

The Johns Hopkins University, Baltimore, MD, USA

Abstract

Azariah Figo was a rabbi and preacher who served the community of Venice and Pisa. Figo is mostly known for his commentary *Giddulei Terumah*, a commentary on Samuel Sardi's *Sefer ha-Terumot*, the first comprehensive code of Jewish commercial and civil law, as well as for his collection of sermons, *Binah le'Ittim*. Printed in 1648, this compilation of sermons continues to enjoy an important reception as it occupies an important position in the evolution of Jewish sermons. Considered a conservative, traditionalist preacher, Figo lately attracted the attention of several scholars who demonstrated the consistent presence in his preaching of scientific and medical analogies and thereby challenged Figo's image as a strict teacher of morality.

Alternate Names

[Piccio, Azariah ben Ephraim](#); [Picho, Azariah ben Ephraim](#); [Pigo, Azariah ben Ephraim](#)

Biography

Azariah Figo was a preacher and rabbi, born in Venice in 1579. He initially had a secular

education but later came to regret his excessive preoccupation with mundane studies and committed himself to the *Talmud*. In 1607, he became the rabbi of the Jewish community of Pisa, where he composed the *Giddulei Terumah* (*The Crops of Donation*), a commentary on Samuel Sardi's *Sefer ha-Terumot* (*The Book of Donations*), the first comprehensive code of Jewish commercial and civil law. Figo had trouble accessing the materials needed to compose the commentary; after the burning of the *Talmud* in 1553, copies of the book were rare, and Figo had to borrow tractates from the neighboring communities. He completed the *Giddulei Terumah* only in 1627, after his return to Venice, in 1643 by which it was published. During his stay in Pisa, Figo also wrote the *Iggerot Vetshuvat*, or *Letters and Responsa*, addressed to the scholar Yissachar Ber Eilenburg, who successively included them in his *B'eir Sheva* (*Well of the Oath*, 1614).

After his return to Venice, Figo became the preacher for the Sephardi community. His sermons reflect a tendency toward a rigorous interpretation of the Jewish law. Vehemently opposed to the establishment of a theater in the Venetian ghetto, Figo was a harsh critic of what he saw as the lax behaviors of his community. His sermons addressed the ostentatious display of wealth and the practice of usury that afflicted the ghetto and could create social rifts among its inhabitants. Figo openly attacked the prohibitive interest rate on the loans with which the rich exploited the poor, devouring "their flesh with several forms of clear-cut, open interest" (Bettan, 239). The rabbi was particularly outraged by the general acquiescence toward these practices in spite of being explicitly forbidden. Figo also condemned with particular fervor the deterioration of sexual customs. He lamented that adultery became a widespread but amply condoned practice that started with the seemingly innocent habit of staring at women but "inevitably leads to graver offences" (Bettan, 237). In another sermon, Figo lists adultery together with idolatry and murder as the three sins that beset the people of Israel. He points out that, while the former subsided, adultery is still rampant and that Jews not only failed to control it but, even worse, lost the

sense of shame and embarrassment associated with this sin.

Although Figo lived in a period in which Jewish religious and cultural life was under constant threat after the Counter-Reformation, his sermons concentrate on the dangers that affect the community from within. His admonishments treat what he perceived was the shattering of traditions and ties in the Jewish community. Figo's words indicate their author's preoccupation in the face of economic and social changes that were impossible to control.

Figo's sermons were collected in the *Binah le'Ittim* (*Wisdom for the Proper Times*), published in Venice in 1648, a year after his death. The 76 sermons of which the *Binah le'Ittim* is composed are devoted to Saturdays and festivities of the Jewish calendar but include some orations on *Avot* (*Chapters of the Fathers*), a compilation of ancient ethical teachings on such topics as education and charity. The *Binah le'Ittim* was a great success, and since its first publication, it was reprinted 50 more times; it still is particularly popular among Eastern European Jews.

Besides preaching, Figo was actively involved in protecting and defending Marranos and Jewish captives, declaring them Jewish. Figo had two sons, Lazzaro and Efreim, who followed in his footsteps and became rabbis. Together they composed a commentary on the medieval scholar Yeruham ben Meshullam's *Toldot Adam veHavva* (*The History of Adam and Eve*, 1516). None of his sons survived him: they both died during the outbreak of bubonic plague that ravaged Italy during the period 1629–1631. Figo died several years later, in 1647 in Rovigo, where he was buried.

Heritage and Innovations

The image of Azariah Figo, as it emerges from his two major works, is that of a staunch defender of his faith and a traditional preacher. In his commentary *Giddulei Terumah*, Figo confesses that, during his youth, he regretfully spent too much time following "the children of strangers," the secular studies, before fully devoting himself to

rabbinic studies. The main topic of his collection of sermons is the passionate plea to his community to follow the *Torah* and its commandments, the only source of truth and eternal happiness. Although these statements seem to reinforce Figo's traditionalist impression, the accusation leveled against him by certain scholars (Berzilai, Rabinowitz, Zinberg) of being anti-rationalist has been amply disproved. Recent research points out that Figo's sermons are littered with scientific and medical references but also that he was a disciple of Leon Modena (Venice 1571–1648). A Venetian rabbi and scholar, author of the *Historia de' riti ebraici* (*History of the Jewish rituals*, 1637), the first detailed description of Judaism written for a non-Jewish audience, Modena cultivated an interest in science and medicine that Figo never opposed. Evidence about their close relationship can be found in a celebratory sonnet for the publication of Modena's sermons in 1602 as well as in an encomiastic poem for the graduation from medical school of one of Modena's protégés, Joseph Hamiz. His longstanding friendship with Modena indicates "his identification with Modena's long-felt commitment to the study of medicine and the sciences among Italian Jews" (Ruderman, *Jewish Thought*, 201). Another sign of Modena's influence can be found in Figo's reticence toward the Kabbalah and its mystical teachings. Although suspicious toward philosophical speculation, Figo was receptive to science and scientific discoveries. In light of these considerations, the shift of his focus to rabbinic studies appears more as a *topos* strategically placed at the beginning of his commentary than the fruit of a profound realization. Figo's secular training, in fact, left clear traces in his sermons, where he refers to various scientific inventions, such as eyeglasses and the telescope.

Figo uses these images to capture his audience's attention with effective and familiar examples, directly drawing from their cultural context. In doing so, Figo perfectly exemplifies the scientific spirit of the seventeenth century permeating with the scientific discoveries and inventions, especially in the fields of optics and astronomy. Figo's repertoire extends further, encompassing also references to techniques to enhance memory

and artificial limbs. The underlying principle that Figo purports and shares with his audience is that humankind is authorized to replicate and improve nature, God's creation.

Even more common than the scientific metaphors are the medical ones: Figo plays at length with the analogy between the sickness of the body and sinful behaviors. In one of his most famous sermons, Figo equates repentance to healing from a disease. He distinguishes two possible treatments: by natural means – or voluntary repentance – and by artificial ones, using cures as evacuation or bloodletting. Figo asserts the superiority of natural healing and references the challenges associated with treatments among them, misdiagnosis, or the weakening of the body in consequence of the cures. These two types of cure mirror the realm of the soul: Artificial remedies stand for repentance out of fear or coercion, which violently cure the symptoms but not the cause of the sin or leave the spirit drained of its strength.

The similes employed in the *Binah le'Ittim* are clear but do not attest to any kind of formal medical education. They rather reflect "the perspective of a person very close to the medical profession" (Ruderman, *Jewish Thought*, 208), a person who had some cognition of the practical aspects of being a physician.

Figo's openness toward science is further confirmed by his epistemological positions.

He juxtaposes to purely rational knowledge the knowledge derived from senses and experience: While the former cannot be fully verified and is susceptible to human errors and fallacies, the latter is always truthful and reliable. The conception of science as the result of observation and experience reflects the distinction between the academic philosopher and natural philosopher that characterizes the empiricist approach that became prevalent in the seventeenth century. This epistemological stance, according to Figo, finds perfect correspondence in the *Torah*, whose wisdom is conveyed through the language of hearing and seeing. Figo does vindicate the superiority of the *Torah* over the secular sciences as the only source of complete wisdom that does not depend upon the natural sciences and external knowledge in general. Although Figo emphasizes their limits, he does not reject sciences. On the

contrary, he dismisses only that kind of knowledge, which derives solely from theoretical knowledge and is devoid of empirical foundations, pretends to reach the truth. The charge of anti-rationalism directed at Figo is, hence, denied by a more in-depth reading of his sermons. The line that he drew between the natural sciences and the *Torah* enables the symbiosis of the two, while, at the same time, upholding the superiority of the second. Figo's defense of Judaism appears modern and aligns with the lexicon of seventeenth-century empiricism.

Impact and Legacy

Azariah Figo is considered one of the last great Talmudists and most authentic voices of Jewish preaching in sixteenth-century Italy. His sermons are still today considered a prime example of Jewish preaching, as proved by their many reprints. Structurally, Figo's writings combine argumentative cohesion with a great clarity of expression. He gradually guides his audience toward the objective of his preaching through an accurate and insightful exegesis of the texts, coupled with the orderly arrangement of ideas. Figo's sermons synthesize elegance of style with topics of high social relevance and make his message particularly compelling.

Figuerola, Francisco de

Born: Alcalá de Henares ca. 1520

Died: Alcalá de Henares 1588/9 Spain

Mercedes López Suárez

Filología Española III, Fac. Ciencias de la Información, Universidad Complutense de Madrid, Madrid, Spain

Abstract

Francisco de Figuerola is one of the most representatives poets of the Hispanic *petrarquismo* who lived under the reigns of Charles V and Philip II. His singularity resides in a sustained loving poetry in a syncretism of philosophical sources, Neoplatonic, and fundamentally literary that he learns during his stay in Italy to the service of the Spanish diplomacy. The reading of treaties and philosophical texts on the nature and loving process (*De amore* of M. Ficino, Cavalcanti's lyric poems, *Dialoghi d'Amore* of Equicola, and *Asolani* of Bembo, among others), plus the stimuli of the academic circles with their personal relations with

intellectuals of the time, conforms the solid basis of his poetry that, although not very wide, it was sufficiently recognized by its contemporaries, among them Cervantes, like one of the most important poets of loving Neoplatonism and of the Italian lyrical tradition that melts with the Hispanic tradition.

Biography

A Spanish Petrarchan poet (Prieto 1984), Figuerola was born in Alcalá de Henares (Madrid, Spain) at an uncertain date (1520 or 1530 Rossi 1993). Probably belonged to an illustrious family of this town, the Ávila o D'Ávila (Portilla 1725), here he received his early education under the private teaching of the humanist Ambrosio de Morales (Redel 1908), of whom Figuerola would see himself years later as his “pupil.” Considering the scarce biographical evidence about the poet, it seems possible that he did not begin his academic training at the prestigious University of Alcalá since, according to the (hardly reliable) biographical notes provided by his first editor Luis Tribaldos de Toledo, “siendo mancebo pasó a Italia donde en parte fue soldado. . .” At that time, Alcalá was a source of young soldiers, and many of the sons of noble families swelled the ranks of Charles V's army, fighting in the Emperor's military campaigns. Italy witnessed Figuerola's intellectual development in the course of several stays in cities like Siena, Rome, and Naples, as can be deduced from the poetical allusions to the rivers (Arbia, Tiber, and Sebeto). In 1559 he leaves Italy for good and begins a diplomatic career that will result in his withdrawal from the lyrical activity.

In 1560, after the peace of Cateau-Cambrésis, he spends some time in France, working as a secretary to Tomás Perrenot de Granvela, and so attending the negotiations between this country and Spain, while witnessing the progress of heresy and the Spanish mediation in the Scottish affairs. After his return to Spain, Figuerola is appointed Philip II's “contino” in 1561. With a stable job at the court in Madrid, Figuerola comes into contact with other poets such as Laynez and Cervantes himself, who immortalized him in his

La Galatea. Before his final return to Alcalá, Figuerola will carry out two more diplomatic missions: the first one, at the service of the Count of Benavente (1567–1570), Viceroy of Valencia for the problems of Moorish insurrection, and the last one on the side of the Duke of Terranova (1579) for the affairs of the Netherlands, which will result in the failure of the religious and economic policy of the Spanish empire. He retires permanently to Alcalá de Henares, where he dies in 1588 (9?).

Heritage and Rupture

His lyrical production, mostly fragmentary love poetry, has not been preserved in autographical documents but in manuscripts by copyists or compiled in other authors' printed material, until the first 1625 edition (Lisbon, Pedro Craesbeck). It is limited to the Italian period and springs from the intellectual inspiration that Figuerola found there. Written evidence from the period (1544) refers to the presence of members of the Ávila or Dávila family in the area of Orbetello and Porto Ercole (Tuscany), strongholds of the Spanish domination in that area, so it is possible that Figuerola's first Italian stay was in Siena, where Diego Hurtado de Mendoza, the humanist poet, governed as the Imperial representative since 1547 (Losi 1997). The sonnet with the epigraphs “Estando Sena en poder de franceses” and “Lauro que en la ribera deleitosa/un tiempo, agora solitaria y triste/del Arbia. . .,” written after the fall of the city on French hands and the dismissal of Hurtado de Mendoza in 1552, and also the poem “Io Bonifacio in questo carnevale” (Gotor 1988) attests to his presence there. Indeed, there are documents that prove Figuerola's involvement with the academic life of Siena from at least February 1547 to February 1549. Perhaps, after his subsequent stays in Rome and Naples, Figuerola returned to Siena in 1557. It is possible that Figuerola studied law in the old Studio of Siena, whose renown attracted a great number of foreign students. In an epistle that Juan de Verzosa, the humanist scholar and diplomat at the service of Hurtado de Mendoza, addressed to Figuerola that

same year (Rome, April 20th, 1551), he reproached the poet for his neglect of the duties as a lawyer and his devotion instead to the ludic and intellectual pleasures of the city, shared with some friends in common. As a matter of fact, in Siena Figuerola enjoys an atmosphere of courtly gallantry and genteel evenings (Ricco 1993) where poetical creativity, stimulated by the reading of the Italian classics (Petrarch, Bembo, Sannazaro, Ariosto), emerges as the social and ludic praxis (Bargagli 1572, 1587). This explains Figuerola's lack of editorial concern. Moreover, he is in contact with the circle of the academies flourishing in Siena at that time (Kosuta 1981; Maylender 1930), which became another of the cultural centers of the city: the Intronati, founded by Claudio Tolomei, the Svegliati, the Inspidi, the Travagliati, or the Rozzi, whose members Figuerola entered in contact with, absorbing the latest literary trends far from his own Spanish tradition. This is the period when he adopts the pastoral name of Tirsi to develop a lyrical-love and Neoplatonic tension in a bucolic key. So far, there is no document proving that Figuerola was a member of any of them.

Innovative and Original Aspects of His Poetry

In this context, the poet gained the knowledge informing the main core of most of his lyrical production, in the light of the poetical standards of the time, where tradition and current literary practice conflated in Marsilio Ficino's widespread Platonism. His *De Amore* or commentary on Plato's *Symposium* inspired the different treatises on love that, in the first half of the sixteenth century and thanks to the print, spread throughout Italy. They are, mainly, Pietro Bembo's *Asolani* (1505), Leone Ebreo's *Dialoghi d'Amore* (1535), and Mario Equicola's *Libro de Natura de Amore* (1525). These were all Figuerola's first-hand readings, in their original versions, before being translated in Spain, and possibly, in the copies that made up Hurtado de Mendoza's well-stocked library. Figuerola's training developed therefore from the very beginning in the culture of a country

where he never saw himself as a foreigner. His command of the Tuscan literary language, already given a status by M. Ficino with his vernacular version of *De Amore* and the abovementioned treatises, allowed Figuerola to write directly in Tuscan lines or to combine in the same composition lines in this language and in Spanish, thus proving the assimilation of the prevailing metrical patterns (as madrigals) and the Petrarchan expressivity. This linguistic skill, which would provide him with the direct knowledge and access to this literary-philosophical culture about love that pervades his poetry, makes him unique in the face of other Spanish poets and contemporaries, who repeatedly described him as a "learned" poet.

In this way, Figuerola could work with this first edition of Ficino's *De Amore*, published in 1544 in Tuscan language. The treatise, an organic and commented compilation of the theories of love by Plotino and Plato (*Symposium* and *Phaedrus*) and of the Neoplatonic postulates by Hermias and Lucretius, probably offered a first approach to the love for philosophy that Figuerola would later deepen with the reading of the abovementioned treatises, which proposed a more contemporary view. *De Amore* was a basic text because, apart from providing the Platonic foundation of the love process and its phenomenology, it formulates a connection with poetry. In this treatise, Figuerola learns about the definition of love as the desire of the soul to search for true beauty (God, as the center or primary source) and the theory of the four circles (mind, soul, nature, and matter or four "lights"), on which the divine beam progressively shines spreading its essence (Ficino, Or. II, chap. 3). Furthermore, here he will read, too, about the perception of the dual nature of love, the spiritual one, and the voluptuous one (Ficino, Or. II, chap. 7), mythographically represented as Celestial Venus and Earthly Venus, which became one of the philosophical axioms to explain the theory of love that would lie behind all the abovementioned treatises (Leone Ebreo, III, "De l'origine d'amore"; Equicola, "Libro II") and, as a result, behind the poetry of the Cinquecento. Ficino explains and illustrates this with the song by the poet and stilnovist "philosopher" Guido Cavalcanti, *Donna me prega* (Ficino, Or. VII,

chap. 1). Widely commented on from the fourteenth century onward, it became a major referent for the treatise writers (G. Pico della Mirandola, M. Equicola, etc.). This emblematic song, which has a controversial interpretation (Averroist, Platonic, Aristotelian; /Marti 1972/), contains a brief lyrical-philosophical treatise on the notion of love and the love process. It represents then to Figuerola a key text that, in general terms, allows him to know Stilnovism. In this text, he learns about the concept of love as an “accident” that springs from and resides in the (lover’s) sensitive soul after the contemplation of the beloved, who stands as the representative of harmonic perfection, and whose eyes project the divine beam of nature. The image of the beloved (“phantasma”) settles in memory (a part of the sensitive soul), and through a process of abstraction, it will reach the intellective soul. This is the origin of Figuerola’s series of poems about the myth of Celestial Venus, focusing on the contemplation of the beloved, the supreme work of nature, where the Ficinian and Cavalcantian readings coexist: *canción* “Tomó Naturaleza/ en su mano un pincel/ y quiso hacer perfecta una figura”; “¿Cuál idea o colores/ de tan sutil manera, pintó jamás pincel o ingenio humano?” or the sonnet “Alma real, milagro de Natura . . ./nido de amor. . ./ni es bien que imagen tan divina sea/sino de amor/. . .en las almas se escriba, allí se lea” (sensitive soul) or also the glose “Desde el corazón al alma quiero señora mudaros,” as the desire for the transfer or process of abstraction whereby the image or “form” will move from the sensitive soul (memory) to the intellect (intellective soul). However, according to Cavalcanti, the evil influence of Mars (*animositatis ardor*) interferes in this process hindering its goal. Then the feeling of love becomes the lover’s inner war, in the dichotomy reason/senses (passion/knowledge) and in melancholy or pessimism. This is the crossroad upon which Figuerola’s other compositions are built. Specifically, Mars’ influence is described by Figuerola in sonnet “Fiero planeta y duro nacimiento/(si en esto, alguna parte tiene). . .”; (López Suárez 1985), where the reading of G. Pico della Mirandola is superimposed over that of Cavalcanti (*Disputationes adversus astrologiam divinatricem*),

as that influence is rejected on the grounds of its coercion of human freedom, giving voice to the doubt with Petrarch’s word (“Fera stella (se’l ciel ha forza in noi/quant’alcun crede”). From the reading of Cavalcanti and of Stilnovism, with the psychological and emotional renewal through a new poetical language that reaches the Petrarchan *Canzoniere*, Figuerola learns and handles better than any other Hispanic poet, the *topos* of the “spiritelli d’amore” (“Per gli occhi fere uno sprito sottile/che fa in la mente sprito destare,/del qual si move spirito d’amare”). This emerges as a poetical formulation of the philosophical-scientific principle of the vital spirits, which he recreates in his sonnet “Oh espíritu sutil dulce y ardiente/ que sales de las dos vivas estrellas. . .” However, in the rest of the sonnet, following the Cavalcantian principle “sentir non po’ di lui spirito vile” in *Donna me prega*, v.5), Figuerola states that “dentro está quien no consiente”. All in all, this “vile” spirit which our poet, alluding to the “sangre corrompida,” blends with the Ficinian explanation (Ficino, Or. VII, chaps. V–IX) condemns the voluptuous love (Earthly Venus).

On these Cavalcantian principles, which portray love as passion, Figuerola’s poetry rests and will rely on those contemporary treatises on love philosophy, providing a syncretism of sources. One of such works is L. Ebreo’s *Dialoghi d’Amore*, a real best seller where Figuerola will find a treatise that amalgamates different philosophical trends together with the Holy Scripture. In *Libro de Natura de Amore*, particularly in “Libro IV,” Figuerola discovers an anti-Platonic theory on the concept of love: love as a natural instinct and an analysis of the phenomenology of love and its physiological motivations underpinned with poetical examples. “I poeti” – Equicola will argue – “descrivono i segni esterni dell’ innamoramento,” and hence, Figuerola will seek a number of love: jealousy (“Dime Fili, así amor dure en el pecho”), tears (s. “Lágrimas que salís regando el pecho”), lover’s pallor (check s. “La palidez y la flaqueza mía”), or sleeplessness: “il somno, ocio dell’anima” (Equicola states), and Figuerola, “Ocio del alma, sosegado sueño.” Figuerola learns through Equicola, too, the defense of the sense of touch (“De’sensi” 8. “I quattro

elementi e i cinque sensi”;13. . .“l’importanza del tatto”) (in opposition to the Neoplatonics’ and L. Ebreo’s disapproval of it), and he will recreate this in the song “Sale la aurora de su fértil manto,” partly cut by censorship already in its first, 1625 edition (“...con amoroso fuego/blandamente me toca y bebe las palabras de mi boca/. . .cogí las tiernas flores /con el fruto dichoso” lines 55–6 and 70–1), which will conclude, in sum, with sensuous pleasure. This is a sensuous feeling probably rooted in the anti-Platonic and medico-physiological theories found in *De pulchro et amore* (1529), by the Aristotelian author Agostino Nifo, a friend of Equicola associated with Charles V’s politics.

The philosophical framework behind Figuerola’s love poetry has its best representative in Bembo’s *Asolani*. Already in his Book I, Equicola provided a highly favorable commentary on this treatise, describing it as “giocondi per somma arte, ordine, dottrina e peritia nell’argomentare.” Together with the example of the interspersed *canzonette*, two main reasons for Figuerola’s view of this work as the key referent for his lyrical training were, firstly, the courtly love nature of the text and, secondly, the writing modeled on the Petrarchan lyricism of the *Canzoniere*, of which Bembo will be the theoretical and regulating *auctoritas* until the end of the sixteenth century. Moreover, Figuerola’s Bembian Petrarchism and Neoplatonism grew stronger through Varchi’s *Lezzioni* (Andreoni 2012) in the Florentine circles. He got ahead of the other Hispanic poets in the reading and success of the *Asolani*, which were not available until the Salamanca translation in 1552. Here Figuerola finds the literary topics of love cultivated in the popular lyrical tradition and the process and concept of love, bringing together its different perspectives through the characters (Perottino’s love-passion; Gismondo’s sensual love; Lavinello’s Platonic-spiritual love) and concluding with a Platonic-Christian version of this concept (Romito). Although in some of his poems Figuerola recreates Gismondo’s approach (madrigal “Vermigli e bianchi fiori” or “Bendito seas Amor perpetuamente”), in general he tends to remain faithful to the idea of love-passion (as developed by Perottino), “disruption” or “fire” as writers call it according to Bembo, amalgamating thus all the

contents that the poet transfers into his poetry as a fragmented practice. From the principle of “amare senza amaro non si puote” (*Asolani*, I, XI), Figuerola explores topics such as the effects of this type of love on the lover: the curses against love (s. “Maldito seas amor perpetuamente”), the effects or dichotomies created by this (“Come porgerà Amore al mio dolore” /ardo, agghiaccio/”), the pain and tears, the effects of fortune, and even the confirmation of the Stilnovist trend as the “spiritelli d’amore” (*Asolani*, II,XXXI).

Impact of His Poetry

Figuerola gained the reputation of “learned” poet among his contemporaries due to this syncretism of philosophical sources that coexist in his lyrical-love poetry. The poet Ramírez Pagán, whom Figuerola could have happened to meet during his stay in Rome and so have a direct access to his poems, includes in the *Floresta de varia poesía* (1562) some compositions by Figuerola, as well as others addressed to him, such as the laudatory sonnet “Tirsi honor y gloria desta ribera” or remarks that: “. . .si desde oy a la cumbre que mereces/como de ingenio el ala más ligera. . .” Similarly, Sánchez de Lima in his treatise *Arte poética* (1580) states that: “Oy día vive y vivirá. . .el divino Figuerola, a quien con tanta razón fue dado este título, pues en sus obras tanto lo mostró, que las mas desechada se puede con justa causa alabar.” Above all, it is Cervantes who will grant Figuerola greater recognition from *La Galatea* (Book II) (1581–1583). In a pastoral note, Cervantes acknowledges his well-deserved reputation as a poet experienced in the “sciencia” of love, through his prominence in this work as an advocate of the Platonic theory of love: “nombrado Tirsi, con lo que tu valor y discreción en las cercanas y apartadas tierras la parlera fama pregona.” Cervantes puts these lines, clearly Neoplatonic, in Tirsi’s (Figuerola’s) mouth: “que la memoria puesta en el objeto/ que amor puso en el alma, representa/ la amada imagen viva al intelecto.” Moreover, he gives voice, as an evocation, to the *incipits* in Figuerola’s compositions such as “Ay de cuán ricas esperanzas vengo” and “La amarillez y la flaqueza mía” and those “so

well-known” lines “Sale el aurora y de su fértil manto.” Figueroa’s renown was, therefore, acknowledged by his contemporaries as it sprang from his poetical-philosophical knowledge acquired in his youth in Italy. Some years later, it was confirmed by Cristobal de Mesa in his *Restauración de España* (1607), next to the praise of Cervantes: “Figueroa con metros elegantes/ iguala los más graves y eruditos. . .”

Filarete

Born: circa 1400 in Florence

Died: circa 1469 in Rome

Ali Madanipour
School of Architecture, Planning and
Landscape, Newcastle University, Newcastle
upon Tyne, UK

Abstract

As a theorist of architecture, Filarete is well known for his *Treatise on Architecture*, which

he wrote between 1461 and 1464 in Milan. In the *Treatise*, which is the first such book in Italian, rather than the usual Latin, Filarete proposes the first star-shaped, ideal city of the Renaissance, reflecting the era's humanism, naturalism, and utopianism. The ideal city of Sforzinda, named after the duke of Milan, was a search for harmony, proportion, and order, which were to be found in ancient history, nature, and geometry. The laws of nature were reflected in the body and expressed in mathematics. The human figure was the source of inspiration, the Greek orders were the best model to be followed, and perfect geometrical shapes were the tools with which to design the city. The human head was the primary measure of the body, which was extended to architecture, as the basis of harmonious relationships between the parts. The desired order was to be achieved by a single design for an entire city, anticipating Machiavelli and Descartes who also looked for a single source of order, which politically became manifest in absolute monarchies. The shift from the human head and body to the human mind, from Filarete to Descartes, however, took two centuries to emerge. The utopian designs of alternative realities became common practice for centuries, and the paradoxical relations with the natural world, simultaneously imitating and transforming it, which Sforzinda displays, are still with us. Although Sforzinda was never built, Filarete's built projects survive in Milan's castle and university.

Biography

Antonio di Pietro Averlino, who adopted the name Filarete (Greek for lover of virtue or excellence), was a sculptor, architect, and theorist, born circa 1400 in Florence. From 1433 to 1447, he worked in Rome on the carved bronze doors of St. Peter's and from 1451 to 1465 in Milan at the Duke Francesco Sforza's castle, the cathedral, and the Ospedale Maggiore (now Milan University). Between 1461 and 1464, he composed his *Treatise on Architecture*, describing in detail the design and construction of the first ideal city of

the Renaissance, the city of Sforzinda, named after the duke, and its port Plusiapolis. He died circa 1469 in Rome (Filarete 1965; Lazzaroni and Muñoz 1908).

Key Ideas

Filarete searches for harmony, proportion, and order, which he finds in history, nature, and geometry. The treatise was inspired by his contemporary theorist Leon Battista Alberti (1988) and the ancient Roman theorist Vitruvius (1999), but it was the first such work written in Italian rather than Latin, with the explicit aim of making it more accessible. History provided the tools to break from the immediate past and the guidelines for the construction of the future.

Nature was reflected in harmony and proportion. Located in a fictional fertile valley, Sforzinda is shaped by a natural order in which "every building [is] located in its place" (Filarete 1965, p. 26). The natural harmony is also found in the human body and its proportions. With its architecture based on the human figure, his city will be "fine, beautiful, and perpetual according to the laws of nature" (Filarete 1965, p. 5). God had formed humans in His image, and they were now able to shape the world in their own godly image. The head, as "the most noble and most beautiful member," was the measure of the body: "if the arms are opened and the hands extended, [the man] will be nine heads in either direction" (Filarete 1965, p. 8). The body becomes the measure of everything in the construction of an anthropomorphic world. As reflected in his fictional host's concern about the future of his natural habitat after the construction of a new city, however, the new relations between the human body and the natural context create a paradox which we still identify to this day: embracing nature while trying to transform it at the same time.

Geometry was the expression of natural proportions and the rational order of space. Sforzinda was the first star-shaped city of the Renaissance, "the first wholly symmetrical town plan in Western history" (Pevsner 1963, p. 185). The basic form of the city is "two squares, one atop the

other without the angles touching,” all enclosed within a circle (Filarete 1965, p. 25). Sforzinda’s radial pattern and its central tower and square reflected central planning, the design of buildings with a central focus, a Roman idea now taken up as a potent symbol of humanism. The discovery of the laws of perspective in around 1425 led to designing buildings that focused on a single center, where the human body stood, a secular idea in contrast with the medieval sacred architecture that aimed at bringing the faithful to the altar (Pevsner 1963).

Legacy

Sforzinda’s geometrical plan prefigured similar designs and the search for a utopian alternative in future centuries. The twentieth-century modernist movement in architecture was one of the latest revivals of this celebration of geometry, order, and utopian futures (Le Corbusier 1978). Filarete’s advocacy of designing an entire city by a single architect anticipated modern philosophical rationalism and political absolutism (Madanipour 2007). A generation before Machiavelli (1950), who argued in favor of a single source of legal and political design, and two centuries before Descartes (1968, p. 35), who advocated that a city should be designed by one designer, Filarete had already designed a completely new city on the basis of a geometrical order. Filarete and Descartes both searched for a new foundation, which they found in human beings, albeit one focusing on the body and the other on the mind but both trying to uncover the laws of nature and express them through mathematics, the language they shared with Galileo’s scientific worldview. Filarete’s sense of the possible tension between urban development and the natural environment was an early indicator of a major problem that is still with us today.

Filelfo, Francesco

Born: 25 July 1398

Died: 31 July 1481

Jeroen De Keyser

Department of Latin Literature, KU Leuven, Leuven, Belgium

Abstract

Filelfo was not a systematic philosopher, yet his works are an apt illustration of the ways in which Quattrocento humanists negotiated the return of the Greek legacy in the West. Filelfo himself brought numerous manuscripts of ancient Greek philosophical texts from Byzantium to Italy, and he was often among the first to incorporate those texts into his writings. Boasting a superior knowledge of the Greek language, he entertained philosophical polemics, mostly concerning doxographical and terminological issues.

Alternate Names

Philelfus, Franciscus

Biography

Francesco Filelfo was born in Tolentino, close to Macerata, in the Marche region. In his numerous writings he remains silent about his parents and pedigree. He received his training in Padua, taking courses of Gasparino Barzizza and Paolo Veneto. In 1417 Filelfo moved to Venice, where as a young teacher of moral philosophy he became acquainted with the Giustinian family, Guarino Veronese and Vittorino da Feltre. In 1420 he left for Constantinople, where he would stay for 7 years. In Byzantium, Filelfo acquired an excellent knowledge of Greek and married Teodora Chrysolorina, a niece of Manuel Chrysoloras. He was sent on diplomatic missions by the emperor, John VIII Palaeologus, and befriended Bessarion. In 1427, Filelfo was summoned back to Venice to teach Greek, but when he arrived with his wife and first-born son Gian Mario, the plague was raging in and Filelfo departed for Bologna to become a professor of rhetoric and moral philosophy. Because of the political turmoil in the city, in Filelfo departed from Bologna in 1429: declining invitations from Rome and Ferrara, he moved on to Florence, where Palla Strozzi and Leonardo Bruni had been instrumental in his appointment as the successor of Giovanni Aurispa. Filelfo lectured on Greek and Latin authors, but also on Dante. He soon ran into conflicts with supporters of Cosimo de' Medici, such as Niccolò Niccoli and Carlo Marsuppini, Ambrogio Traversari, and Poggio Bracciolini; they were all severely ridiculed for decades to come in Filelfo's writings. The purges after Cosimo's return to power in 1434 drove the oligarchic faction into exile, and Filelfo decided to leave Florence for Siena. There he was attacked by the Medici hit-man who had already left a life-long scar on Filelfo's face in Florence. Filelfo then hired a mercenary himself to go after Marsuppini and Cosimo, which made his situation in Siena untenable. He accepted Filippo Maria Visconti's invitation to come to Milan, where he

arrived, after a second short intermezzo in Bologna, in June 1439. After his first wife passed away in 1441, Filelfo married Orsina Osnaga, and after her demise in 1448 Laura Maggiolini. Following Visconti's death in 1447, Filelfo's patrons were, first, his son-in-law Francesco Sforza, and then the latter's son Galeazzo Maria Sforza. Their at times lukewarm attitude made Filelfo look for employment at other courts, but in the end he stayed in Milan for most of his life. Repeated attempts to secure a position at the Curia in Rome failed until Pope Sixtus IV invited Filelfo in 1474. In 1476 Filelfo's third wife died as well. After long negotiations with Lorenzo de' Medici, Filelfo was finally invited in 1481 to return to Florence to teach Greek at the Studio. Shortly after the exhausting journey from Milan, he died on 31 July, and was buried the next day in the basilica of Santissima Annunziata (Viti 1997).

Writings

Filelfo was an exceptionally prolific writer (De Keyser and François 2015). He started his career as a translator of classical Greek literature and did so Latinizing Dio Chrysostom's *De Troia non capta* while travelling back from Constantinople to Venice (Leotta 2008). Apart from some minor efforts, such as Latin versions of two orations by Lysias (*Funebris oratio* and *Eratosthenes*), two short treatises by Hippocrates (*De flatibus* and *De passionibus corporis*), Basil the Great's letter *De vita solitaria* to Gregory of Nazianzus, and twice the apocryphal *De sacerdotio Christi* (De Keyser 2013), his main focus was on Xenophon, with renderings of the *Respublica Lacedaemoniorum*, *Agésilas*, and – his last and major undertaking – the *Cyri Paedia* (De Keyser 2012), and on Plutarch, one of his favourite authors. Filelfo translated Plutarch's two apophthegm collections (*Apophthegmata Laconica* and *Apophthegmata ad Traianum*) and his biographies of *Lycurgus*, *Numa*, *Galba*, and *Otho*. His translations of three letters by Plato (Hankins 1990) and of the *Euthyphron* (Martinelli Tempesta 2009), probably produced in the 1430s or early 1440s, were not widespread and

received little attention. Filelfo's Latin version of ps.-Aristoteles' (Anaximenes') *Rhetorica ad Alexandrum*, on the contrary, survives in some thirty manuscripts and went through six incunabula editions.

The plethora of Filelfo's own works displays his ambition to be active in as many genres as possible, both in prose and in verse. He produced 100 *Satyrae*, of 100 hexameters each (Fiaschi 2005); 5000 verses of *Carmina* or *Odes*, in all possible Horatian metres (Robin 2009); a collection of epigrams, *De iocis et seriis*; the *Sphortias*, an epic poem celebrating his patron Francesco Sforza (De Keyser 2015a); and even a collection of Greek poems (Cortassa and Maltese 1997).

Filelfo's prose writings comprise the *Commentationes Florentinae de exilio*, a consolatory philosophical dialogue in three books dedicated to the aristocrats that were exiled after the return to power of Cosimo de' Medici in 1434 (De Keyser and Blanchard 2013) and the *Convivia Mediolanensia* in two books, a Plutarchan dialogue also written in the 1440s; this ambitious encyclopaedic and eclectic work may reflect an attempt to supersede Pier Candido Decembrio's *De inventoribus septem artium liberalium* (Gionta 2005a). The *Consolatio de obitu Valerii*, written for the Venetian patrician Jacopo Antonio Marcello, whose son Valerio had died at the age of eight in 1461 (François 2015), contains a long section discussing the immortality of the soul; the topic is repeated in a similar, yet more concise way in the *Oratio parentalis de divi Francisci Sphortiae Mediolanensium ducis felicitate*, the eulogy delivered by Filelfo in 1467 at the first anniversary of the demise of Francesco Sforza (De Keyser 2015a). Another celebratory biographical writing is the unfinished *Commentarii de vita et rebus gestis Frederici Urbinate*, about Filelfo's patron Federico da Montefeltro. His last major work was the philosophical treatise *De morali disciplina* (1475) intended to enhance his standing as a philosopher when he tried to convince Lorenzo de' Medici to call him back to Florence, where he had been teaching Greek and philosophy more than 40 years earlier (Kraye 1979). Filelfo also produced numerous occasional Latin orations, but his

most important literary legacy is arguably the collection of 110 Greek and more than 2000 Latin letters, addressed to friends and family as well as to princes and prelates all over Europe. This massive *epistolarium* in 48 books is a major source of information, both for Filelfo's own life and opinions, and for the history of the Quattrocento in general (De Keyser 2015b).

Philosophical Positions

Named as the only Italian humanist before Ficino with a real grasp of Plato (Hankins 1990), Filelfo is usually considered an eclectic and syncretistic thinker, holding some kind of middle ground between *Platonici* and *Aristotelici* (Bianca 1986), mostly leaning towards Aristotelianism (Kraye 1979). While he first seemed to remain on the fence in the famous controversy between Plato's defender Bessarion and his slanderer George Trapezuntius, in the end Filelfo sided with Bessarion and his supporters (such as Niccolò Perotti and Theodore Gaza), albeit somewhat reluctantly. His ambivalence may in this case have been more personal than principled, given his life-long friendship with both Bessarion and Trapezuntius (De Keyser 2011), although he often did try to reconcile both philosophers' stances, emphasising what united the master and his pupil rather than what divided them (Bianca 1986). However, his allegedly gradually increasing sympathy for Platonism (Robin 1991) had been present for a long time: the Platonic flavor perceived in the late *De morali disciplina* pertains to passages that Filelfo actually recuperated almost verbatim from his *Commentationes Florentinae de exilio*, written a quarter of a century before (De Keyser and Blanchard 2013). Even before *De exilio*, he had produced his translation of the *Euthyphron* (Martinelli Tempesta 2009) and of three of Plato's letters (Hankins 1990), while in various writings he discussed the Platonic concept of Ideas, mainly through an Augustinian prism (Kraye 1979; Hankins 1990).

Apart from those philosophical writings, other relevant sources for Filelfo's philosophical positions are the discussion of the immortality of the

soul in the *Consolatio ad Iacobum Antonium Marcellum* and the *Oratio parentalis* (De Keyser 2015a) along with numerous letters in his epistolarium (De Keyser 2015b). In one of his letters, Filelfo underscores that the manuscripts he brought back from Byzantium contained not only poets, orators, and historians but also philosophers and theologians (letter PhE-06.57); elsewhere states that the only true philosophy is Christian philosophy (PhE-07.21) and that all Christian theologians are superior to any pagan philosopher (PhE-12.80). Still, his explicit stances on theology and patristics are all but limited to an assessment of the relative value of Jerome and Augustine, which shows him to consider the latter the more competent philosopher (PhE-06.74). Although he expounds Platonic theories on the tripartite division of the soul (PhE-01.12; see also Giustiniani 1980; Kraye 1981) and defends Epicurus against his detractors, claiming that the latter's *voluptas* concept concerned the pleasure of the soul rather than of the body (PhE-01.46), Filelfo explicitly calls himself a lifelong adept of the Stoa (PhE-08.08), which he considers the most serious of all philosophical schools (PhE-26.01). This Stoic preference is reflected in numerous letters highlighting the true philosopher's concern for *virtus*, *honestas*, and *officium*. In other letters, Filelfo can be seen chasing philosophical manuscripts, in particular of Pythagorean texts and of Albert the Great. According to Filelfo, a philosophical scholar needs a thorough knowledge of all philosophical schools (PhE-29.28) and it is clear that he considers his own broad knowledge in this respect a most important asset, as is most aptly illustrated in a long essay letter on the Platonic Ideas (PhE-22.01; see also Hankins 1990) and in the doxographical catalogue in the *Oratio parentalis* (De Keyser 2015a, §25–26).

Philosophical Relevance

Although Filelfo might justifiably be considered more a poet and a – mainly philologically interested – “scholar” than a real philosopher, he did like to fashion himself as an expert concerning

(the history of) philosophy as well. Boasting his superior knowledge of the Greek language, he entertained polemical discussions about doxographical and terminological issues. However, fundamental theological questions – such as the ones dividing the Churches of Rome and Byzantium – do not seem to interest him. Filelfo was certainly not an original philosophical thinker, nor did he pretend to be one. His role was that of a mediator between ancient Greek philosophical source texts and contemporary intellectual debates. Filelfo enjoyed a privileged position when it came to realizing such endeavors because of his 7-year sojourn in Constantinople, which made him perhaps the foremost nonnative expert on Greek in the Quattrocento. It also yielded direct contacts with the most prominent Byzantine scholars. After his return to Italy, and subsequently the fall of Constantinople, Filelfo stayed in close contact with the Greek diaspora, enjoying the patronage of émigré scholars such as Cardinal Bessarion and his circle.

Filelfo also played a crucial role in the import of manuscripts of ancient Greek (philosophical and other) texts to Italy – which he famously listed in a letter to Ambrogio Traversari (quoted in, e.g., Cao 2001, note 47) – and made extensive use of them in his own writings. His collection of Greek manuscripts must have been very extended (Eleuteri 1991) and so was his familiarity with the entire Greek literature, be it directly or indirectly (Calderini 1913). Nevertheless, it is striking how mediated his knowledge often was. Second-hand information, such as supplied by Diogenes Laertius, Diodorus Siculus, ps.-Plutarch's *De placitis philosophorum* and *De musica*, or the Byzantine *Suda* lexicon, often appears to be Filelfo's first source (Gionta 2005a, b). Even his reading of the most important authors, such as Plato and Aristotle, at times appears derivative (Wilson 1992). His ability to read both authors in the original Greek notwithstanding, Filelfo borrowed many of his utterances on Platonism from Middle and Neoplatonic sources, often either Plutarch or (ps.-)Augustine (in particular *De spiritu et anima*). Furthermore, in the *Commentationes Florentinae de exilio* he

incorporated entire pages from Albert the Great's commentary on the *Ethics* rather than citing Aristotle himself (De Keyser and Blanchard 2013). These dialogues *On Exile* are also important because they prove Filelfo to have been the first humanist who was familiar with Sextus Empiricus, although his extensive quotations do not contain a thorough critical assessment of Scepticism. Of Sextus' text Filelfo owned the current Laurenziana ms. Plut. 85.19, which was later also used by Angelo Poliziano, Giovanni Pico della Mirandola, and Marsilio Ficino (Cao 2001).

While fashioning himself as a learned and well-balanced Stoic sage – with a touch of cosmopolitan Cynicism (Blanchard 2007) – Filelfo's first and foremost calling was that of an expert translator and commentator of the classical tradition.

Filmer, Sir Robert

Born: East Sutton, Kent 1588

Died: East Sutton, Kent 1653

Cesare Cuttica

Université Paris 8, Paris, France

Abstract

Victim of John Locke's late seventeenth-century searing attack aimed to dismantle his patriarchalist political ideas, Sir Robert Filmer (1588–1653) was for a long time considered the villain par excellence in the history of political thought. His works were seen as containing archaic, obsolete, and authoritarian principles. However, thanks to new scholarly approaches based on the methodology of contextualism, Filmer's writings have been studied in connection with the polemics of the time during which they were composed. His political ideas have thus been analyzed as a powerful – even though in the long term unsuccessful – theoretical attempt to shape an absolutist vision of sovereignty at the center of which stands the king as father of the fatherland. This revisiting of Filmerian works has also cast light on his less-known tracts on important early modern issues such as theology, women and the household, witchcraft, and usury. Ultimately, Filmer has nowadays acquired a different – that is, finer – reputation as a thinker whose contribution to the history of ideas deserves a place only a level lower than that of high-caliber authors like Hobbes and his archenemy Locke.

Biography

Born in a wealthy and influential gentry family, Sir Robert's formative years were similar to those of many young members of his milieu: after matriculating at Trinity College, Cambridge (1604), where he never graduated, the following year he was admitted to Lincoln's Inn and 8 years later he enrolled as a member of the Bar despite

never practicing as a lawyer. Married to Anne Heton, elder daughter of Martin Heton, the powerful Bishop of Ely during James I's reign, Sir Robert is mainly known as the author of the notorious *Patriarcha* (published in 1680 but ready for publication in the early 1630s) whose sole merit for many interpreters was to have been picked by John Locke as the main target in the *First Treatise* (1689). Filmer – who besides political tracts such as *The Anarchy of a Limited or Mixed Monarchy* (1648) and *Observations Concerning The Original of Government, Upon Mr. Hobs Leviathan, Mr. Milton against Salmasius, H. Grotius De Jure Belli* (1652) wrote short works on theology, women and the household, witchcraft, and usury – came to be associated with the patriarchalist theory since he insisted on the political role of Adam as first king on earth to whom God had assigned absolute power over all creatures and from whom power had then passed on to kings through the ancient patriarchs.

Heritage and Rupture with the Tradition

Filmer has been depicted as a narrow-minded representative of a patriarchal society; as a conventional absolutist; or, simply, as the exponent of archaic beliefs which failed to succeed in the theater of ideas when confronted by the typhoon of modern philosophy, empirical science, and social change. *Patriarcha* has throughout the centuries attracted a long list of detractors, including the *philosophe* Jean-Jacques Rousseau. Filmer's treatise has been seen as a strong justification for the dominion of fathers/husband/masters over children/wives/servants. His patriarchalism has been portrayed as the epitome of a personal authority antithetical to an artificial and liberal conception of politics, as the quintessence of women's subjugation to men, and as a specific structure of production and labor characterizing the household.

Innovative and Original Aspects

His originality lies in that Filmer employed a conservative political vocabulary (patriarchalism)

in a radical fashion to demonstrate that an all-powerful monarch was the sole guarantee of people's liberties and the nation's peace against internal conflict and external interference.

Impact and Legacy

Always opposed to popular participation in government, Filmer's works – where he also stressed the need for subjects to unconditionally obey their king represented as protective *pater patriae* and argued that politics was a complex domain that required specific competence – anticipated some modern reflections on the solitude of the (unbounded) ruler and the solitude of power as indispensable and irrevocable conditions for the working of all good and effective politics. In this respect, Filmer is one of the early modern thinkers who did the most to show the faults of democratic government in ways which are still employed nowadays to criticize this polity: a careless attitude toward the public good, cumbersome mechanisms of decision-making, high taxation, and limited viability (e.g., small territories).

Interconnections

Undoubtedly absolutist, Filmerian ideas have very often been read out of context, that is, with no relation to the debates and controversies in which they originated. Victim of Locke-inspired mockery, Sir Robert was until recently viewed as, at best, a straw man, when not a plain villain, in the history of political thought where his opinions were reputed to be both absurd and oppressive. This historiographical approach failed to engage with Filmer's forceful theory of absolute and arbitrary government as the response to authors who supported the idea of an original state of nature in which people were free and equal (e.g., Thomas Hobbes) and to a growing number of thinkers as well as MPs who in the first decades of the seventeenth century in England claimed Parliament's patriotic role against the king (e.g., Puritan and resistance theorists). In addition to these targets, Filmer attacked Jesuits such as Robert Bellarmine

and Francisco Suárez for defending the theory whereby the Pope could intervene in the temporal sphere.

as a common empirical healer in Palermo, he moved up the Italian peninsula as well as the social hierarchy, becoming first a licensed surgeon (Naples, Rome), then a successful medical writer (Venice) and a graduated physician (Bologna), and finally a doctor at the court of king Philip II of Spain. A supporter of alchemical medicine and a master of self-fashioning, Fioravanti portrayed himself as the miraculous healer, the new Asclepius, the initiator of a new way of curing. His reputation swung for all his life (and in the following centuries) between that of an untrustworthy mountebank and that of a medical genius, earning him admiration and contempt in equal measure. The truth lies probably in the middle: although his bombastic claims and his advertising strategies put him in close relationship with charlatans, some aspects of his practice truly foreshadowed some future developments in medicine. His whole activity is characterized by an explorative attitude, an experimental approach, and a general refusal of the academic immobilism, all key features of the upcoming scientific revolution.

Abstract

Leonardo Fioravanti was one of the most peculiar medical practitioners active in late sixteenth-century Italy. Beginning his career

Biography

Although it is possible to pinpoint a few moments in Fioravanti's life by means of archival records (whose most complete account is provided by Eamon 2010; see manuscript and archival sources below), what we know about him comes mostly from the autobiographical notes disseminated throughout his books; his journeys and accomplishments therefore have to be taken with some reservations.

Fioravanti was born in 1517, in Bologna, where he might have started a training in medicine or surgery. In 1548 he left the city, headed to Genoa and from there to Sicily, without any

experience nor academic title. Nevertheless, he states to have quickly gained some recognition in Palermo with his spectacular healings (among the others a splenectomy, a very difficult operation at that time), and to have become acquainted with the Spanish milieu. In 1549 he moved to Messina, and after a few months he sailed to Naples. During his journey he stopped in Tropea, where he tricked the surgeons Pietro and Paolo Vianeo and learned their secret rhinoplasty technique. In Naples, he entered the service of the Spanish viceroy, don Pietro de Toledo. While there, he became familiar with the Neapolitan scientific milieu, the philosophy of Bernardino Telesio and the local academies (see Eamon 2010, 102–121; Eamon 2017): he probably gathered around him a group of friends and disciples, devoted to experimenting and distilling drugs. Also, in this period he obtained a license for practicing surgery from the local *protomedicato*. In the following years he joined the Spanish army as a military surgeon in the campaign of Africa (1550–1551; nowadays Mahdia, in Tunisia) and in the first years of the war against Siena (1552–1559).

He then moved to Rome, where – he says – his miraculous cures gained him both the friendship of the noblemen and the envy of the graduated doctors. Although reports of his surgical treatments in the city are available since 1555 (ASR, Tribunale del Governatore, bb. 6 and 6/2), he was practicing without a license from the Roman *protomedicato*, which he eventually obtained in 1557 (ASR, Camerale II, Sanità, f. 20v). Despite being now authorized, he states that in the same year he was sued by a group of 12 physicians who wanted his license revoked and his remedies forbidden, and lost the trial.

After this setback, Fioravanti left Rome for Venice, where he arrived in autumn 1558. There he soon befriended local apothecaries, alchemists, and artisans, but also well-known polygraphs like Girolamo Ruscelli, Dionigi Atanagi, and Francesco Sansovino, and became acquainted with the Venetian book market. He stayed in Venice for at least 15 years, becoming a successful medical writer: apart from editing a few surgery texts (see Rositini and Rositini 1561), he authored two books of secrets (*Secreti medicinali*, 1561,

reprinted in the same year with the new title of *Capricci medicinali*; and *Del compendio de i secreti rationali*, 1564a), a treatise on the plague (*Del regimento della peste*, 1565), one on surgery (*La cirugia*, 1570a) and his most autobiographic book, *Il tesoro della vita humana* (1570b). He also wrote an encyclopedic work on human arts and professions (*Dello specchio di scientia universale*, 1564b), deeply influenced by his observation of the Venetian marketplace.

In the meantime, he also tried other ways to increase his fame. Officially appointed by the Republic of Venice (ASV, Senato, Terra, b. 45, c. 200v), in 1561–1562 he made an attempt at repopulating the dying city of Pola, strained by malaria: but despite some good ideas in terms of land reclamation and hygiene (such as the suggestion of putting *incerate*, prototypes of mosquito nets, on the windows), his effort was essentially a failure (Camporesi 1997, 192–198; Eamon 2010, 228–232). He also repeatedly tried to gain the favor of two princes particularly fond of technical arts, grand duke Cosimo I de' Medici and duke Alfonso II d'Este; but neither of them showed much interest in his letters (nowadays conserved in the State Archives of Modena and Firenze, and at the Biblioteca Estense in Modena) and his high-flown projects, nor they offered him a place at court.

With all this, he was still practicing medicine without authorization, as the Venetian *Provveditori di sanità* had refused his application in 1563 (ASV, X poi XX Savi, b. 24); eventually he was licensed, although probably only for surgical interventions (ASV, Giustizia Vecchia, b. 49, reg. 79). Finally, in 1568 Fioravanti applied for a degree in arts and medicine at the University of Bologna: he quickly obtained the diploma and the title of count and knight associated to it (ASB, Studio Bolognese, 193, Liber Actorum Utriusque Collegii, ff. 131r, 134v; edited in Gentili 1951).

Nevertheless, his unorthodox convictions kept causing him troubles with the medical establishment: in 1573, in fact, he was imprisoned in Milan under the charge of causing some deaths with his unconventional medicine. The episode, carefully omitted by Leonardo in his books, is reported by an archival source (ASMi, Autografi, Medici,

215, fasc. 15; edited in Dall'Osso 1956 and Camporesi 1997).

In 1576 Fioravanti was invited at the court of king Philip II of Spain, in Madrid. There he acquired a first-hand knowledge of the drugs and marvels from the New World and of the treatise written on American herbs by the physician and botanist Nicolás Monardes (1574). But once again, in 1577 his alchemical medicine led him to trial, standing charges of having killed a servant with his unorthodox drugs and of practicing medicine illegally. Fioravanti withholds this fact too, but a manuscript in Castilian accounts for it (see BL, Add. MS 28,353, ff. 57–61).

Although the outcome of the trial is unknown, soon after it Fioravanti was back in Italy, traveling between Naples, Rome, and Venice. His last book, *Della fisica*, largely indebted to his experience at king Philip's court, was published in Venice in 1582.

Fioravanti's date of death is unknown: it was certainly after 1583 (when he authored a new edition of his *Specchio*), and possibly even after 1594, when his *Regimento* was republished with some original additions (Eamon 2010, 300). The most accepted date, 1588, probably derives from the eighteenth century historians' confusion with Valerio Fioravanti, a Bolognese physician who died in that year.

Heritage and Rupture with the Tradition

Fioravanti's writings are characterized by a decisive rupture with academic medicine. His practice is guided by experience, common sense and a certain dose of skepticism: such approach makes him close to the ancient Empiric School. "The scourge of the doctors" (Eamon 2010, 10), Fioravanti accuses them to have abandoned the people, to be greedy and ignorant, and to have lost sight of the true medicine. He gradually comes to consider the Galenic theory of humors (which cannot be seen and are therefore impossible to prove) to be useless, because medicine should cure the disease, not speculate on its invisible causes. A similar repugnance is reserved for anatomy (Eamon 2010, 41–47; Klestinec 2016,

48–52) and for some pointless – if not dangerous – practices. He rejects long-lasting treatments based on strict regimens and weak drugs (the most frequent course of action prescribed by academic physicians). He also refuses to drain wounds or to cauterize them with boiling oil or red-hot iron: instead, they should be disinfected with ointments and waters, tied up strictly and cleaned often.

Although sharing the Galenic appreciation for *simplices*, Fioravanti firmly believes that these should be brought to their essence (where the healing power lies) by means of alchemical processes – first of all, distillation. In his appreciation of quintessences, he shows some connections with the medieval tradition of Arnaldus de Villanova, John of Rupescissa, and pseudo-Ramon Llull. His familiarity with alchemists and distillers dates back to his Sicilian and Neapolitan years; but it is especially after his encounter with the Milanese alchemist Ettore Ausonio that Fioravanti embraces the quest for the philosopher's stone. What he seeks is not much a way to produce gold from mere metals, but rather the universal cure, a panacea for all diseases, what he calls "Magna Medicina" (Fioravanti 1582, 171; see Eamon 2010, 204–209). Such goal might also have inspired his journey to Spain, where king Philip II was commissioning alchemical experiments inspired by the pseudo-Lullian philosophy (Eamon 2005).

Innovative and Original Aspects

Fioravanti's main critique of the medical establishment stands on its theoretical nature. In his opinion a good physician could not acquire true knowledge by reading and speculation, but only by observing nature and "walking the world" with curiosity and open mind. The doctor's most important tools, according to him, are not bookish notions but shrewdness and good judgement. He advises speaking especially with craftsmen and common people: midwives, shepherds and farmers are in his eyes the bearers of an empirical wisdom which comes from their close contact with nature, and which therefore far outclasses the academic medicine. Still, he believes that

experience has to be guided by a method in order to acquire true knowledge; but he never clearly defines the nature of this method (Eamon 1994, 190–191).

Another criticism is directed to the Galenic tripartition of medicine in diet, drugs, and surgery, radicalized in his days by the growing authority of the *Protomedicati* and by the predominance of graduated physicians over apothecaries and surgeons. Fioravanti advocates the necessity of reuniting these three arts, arguing that originally they were but one profession. He embraces the idea of a Golden Age when medicine was close to nature and at everyone's hand, until it started to be codified in philosophical systems, giving power to theory over practice and to the learned physician over the illiterate empiric (see Eamon 1993).

The predilection for hands-on experience over theory leads Fioravanti to praise all technical arts: he shows interest in metallurgy, perfumery, agriculture, military weaponry, naval engineering and many other manual skills. Above all he is fond of alchemy, which he considers in its practical implications: mostly how to distill drugs and prepare quintessences. He doesn't appear to take much interest in the obscure, theoretical aspects of alchemy (although showing appreciation for pseudo-Lullian philosophy), nor in its connection to astrology. William Eamon (2000) has even argued that, although sincerely believing in the power of distilled drugs, Fioravanti's alchemy was largely a matter of fashion and competitiveness in the contemporary medical marketplace.

Standing somewhere between Telesian philosophy and medical primitivism, Fioravanti sees nature as "the universal standard of the truth" (Eamon 2010, 110); he therefore proposes a new way of curing which is, essentially, a return to what he considers the "rules of nature." He distances himself from anatomy (which he compares to butchery) and finds a better source of inspiration in farming: hence his refusal of cauterizations and draining procedures and the idea that a surgeon should help the natural healing of wounds, just as the farmer does with a broken plant. Similarly, his internal medicine is inspired by the observation of animals, which know by instinct how to purge their bodies from ailments (Eamon 1993).

Purgation is probably the major stronghold of Fioravanti's medical doctrine: rejecting Galenic theories and conceiving of the body as the "kitchen of nature" (Fioravanti 1570a, fol. 22r), he maintains that every disease is the result of foul corruption which condenses in the stomach; he therefore aims at purifying it with powerful emetics. The martial spirit of his medicine probably conveys his experience with the Spanish army and might even be intended to play on the popular chivalric theme (Eamon 2010, 125), but it also aligns with the Counter-Reformation temper: illness is a corruption of the body, just as heresy is a corruption of the soul, and both have to be driven out of the human being quickly and by extreme means, if necessary (Eamon 1994, 189–190). His idea that all diseases originate in the stomach also motivates his quest for a universal remedy (a medical philosopher stone). Eamon has suggested that this obsession with purging the body derives from Fioravanti's familiarity with barber-surgeons, whose job was to cleanse the body not only aesthetically, but also internally: for instance, with blood-letting therapy (Eamon 2010, 83). Blood (and its purging) is very important to Fioravanti; in his latest work, *Della fisica*, he states that all diseases are originated from the corruption of either blood or stomach. He even affirms that distilling blood would produce a quintessence which, according to him, has marvelous curative properties (Fioravanti 1582, 166).

While establishing his new way of healing, Fioravanti also carries out an ideological message, which targets not only the medical culture: to him, the spread of new and old diseases and the uselessness of official medicine are a consequence of the corruption of contemporary society. He is clearly pointing out such moral decline not only when he participates in the common belief that the plague is God's punishment for men's sins, but also when he suggests that syphilis (the sixteenth-century new and dreadful epidemic disease) is caused by the practice of cannibalism (Eamon 1998). More than once he laments the depravity of Italian princes and of their courtiers; on the contrary, he praises the lower classes for their closer connection to nature and for their practical knowledge. Coherently with his concrete

approach to life, he acknowledges the dignity of mechanical arts: in his *Specchio* he presents the professions by practicality and usefulness (giving the first place to agriculture), in what Douglas Biow has called “a rhetoric of praise and blame” (Biow 2015, 135–136). Despite this veiled effort at somehow “leveling” society (an effort carried out also by divulging his knowledge in cheap books written in the vernacular) he avoids any further step in the sociopolitical direction, confining his reformistic attempts to medicine.

Impact and Legacy

Fioravanti's fortune largely relies on his communicative skills (Biow 2015, 117): with his books he paved the way to a new style of medical writing. His friendship with polygraphs like Ruscelli and Atanagi on the one side helped him understand the great potentialities of printing, and on the other side allowed him to broaden his culture. In his works he shows a remarkable entrepreneurial attitude and a talent for narration, which go along with a careful self-fashioning in words, pictures, and behavior (on Renaissance self-fashioning, see Greenblatt 1980). As such, books were not only a means to disseminate his ideas and to provide an alternative to the academic medicine; they were also the virtual *piazza* of his medical performances, a place where Fioravanti could display his histrionic character and advertise his own remedies and works, like a charlatan from his bench. Fame was what he sought in the first place: to achieve this goal, he chose to write in the vernacular and to adopt a simple, effective, and attractive style. His books are rich in hyperboles, anecdotes, and remedies with catchy names, but they also contain contemptuous criticisms of contemporary society: all useful ingredients in drawing the attention of a broad audience. However, as those polygraphs that he befriended, he was not unfamiliar with plagiarism: Paolo Cherchi has shown how the second book of his *Specchio* (the more humanistic in style and contents) is largely indebted to Antonio Guevara's *Epistolas familiares* (Cherchi 1995, 1998).

Story-telling and theatricality played a crucial role in fascinating and luring readers into buying (more of) his books. This is most evident in the *Tesoro della vita humana*: the second section of this work is largely a picaresque account of Fioravanti's life, the tale of a nobody who with tricks, boldness, curiosity and fortune acquires truth and wisdom, finally achieving the social rank of doctor and knight. Furthermore, in the third section Fioravanti publishes the letters received from (and sent to) patients and colleagues seeking his counsel; and from admirers praising him both as doctor and writer. The dialogic nature of these letters allows Fioravanti both to promote his empirical method and to advertise his books and remedies by means of many different voices (Bayle 2009).

His strategies proved to be highly effective: all his books met with immediate success, and almost 100 editions and translations were issued up until 1700 (a complete list is provided by Eamon 2010, 322–323; for 16th-century editions see also EDIT16 2019). The adaptation of his works by the London apothecary John Hester played a relevant role in the spread of alchemical medicine and distillation practice in England (Pantin 2013); his empirical approach and his statements about social corruption even resonated in Montaigne's writings (Losse 2015, 85–105). His remedies were known throughout Europe as well as his books, even reaching the New World: one of his drugs, *Fioravanti's balm*, was still sold by the apothecaries well into the eighteenth century.

In his attempt to captivate the public, Fioravanti not only denounces the uselessness of contemporary medicine; he also proposes a concrete “other way,” with drugs and therapies characterized by a deep understanding of what was fashionable on the sixteenth-century marketplace (Eamon 2003). Moreover, among his blustering claims it is possible to find some noteworthy statements: his idea that cures should rely on drugs rather than on a rebalancing of humors was, for one, particularly modern. Also, his description of practices like splenectomy and rhinoplasty influenced the medical debate in the

following decades (see Webster 1971, 159–161; Santoni-Rugiu and Mazzola 1997).

In fashioning his *persona* of “maverick physician” (Biow 2015), Fioravanti managed to put himself at the center of an alternative medical movement, with followers everywhere. The extent of such milieu is suggested especially (but not only) by the epistolary section of his *Tesoro*. The publication of his private correspondence with his patients, despite being essentially a promotional enterprise, played also a significant role in expanding the medical discourse out of the academic niche: by addressing the patient directly and in vernacular, he was sending the message that medical knowledge could be within everyone’s grasp (Bayle 2009).

With his adventurous life, Fioravanti also set a prototype for wandering empirics and charlatans, although staging his *persona* in books rather than squares (Gentilcore 2006, 268–269; Gambaccini 2004; Eamon 2010, 166–174; Cosmacini 1998). His defiant behavior inspired satirical characters like Giulio Cesare Croce’s *Bertoldo*, and political and religious polemicists like Costantino Saccardino. Although not a Paracelsian, he had many admirers among spagirists, like Tomaso Zefiriele Bovio or the later Giuseppe Donzelli. He became a symbol of anti-authoritarianism, and was often quoted in seventeenth- and eighteenth-century medical literature by those aiming at demolishing Galenic dogmas. However, nineteenth- and early twentieth-century historians of medicine mostly branded him as an untrustworthy charlatan: his name has been somehow rehabilitated only during the last century starting with the biography of Davide Giordano (1920; see Eamon 2010, 302–314).

Finally, Fioravanti managed to extend his influence beyond medicine: his *Specchio di scientia universale*, a result of his insatiable observation of human arts, anticipates and provides a model – although from a completely different perspective – for Tomaso Garzoni’s *Piazza universale di tutte le professioni del mondo* (1585), one of the first examples of a new literary genre, the *letteratura dei mestieri* (Mocarelli 2011; Vidali Giorio 1969).

Abstract

Despite the lack of novelty in his thought and of elegance in his writings, Ambrogio Flandino was in many ways a rather important voice in several debates of the early sixteenth-century

Italian intellectual world, engaging in philosophical and theological disputes with Erasmus, Pietro Pomponazzi, and Martin Luther.

Alternate Names

Biography

Ambrogio Flandino was most likely born in Naples around 1467. Not much is known of his early life if not what he himself tells us: that he entered the Augustinian order, in which he was fostered by the future general Giovanni Antonio da Chieti and in which he studied modeling himself on the examples of Mariano of Genazzano and Giles of Viterbo. It is with the election of the latter as the Augustinian order's prior general (1507), as numerous letters testify, that Flandino's career enhanced: he became regent of the convent of S. Giacomo in Bologna and later *magister senior* and regent in Florence (1509) (Giles of Viterbo 1992). The date of his nomination as provincial of Terra di Lavoro is uncertain, yet he surely had already been appointed by mid-1511. Flandino had no success here neither in appeasing the unruly Neapolitan convent nor in ushering the order's reform. He soon had to face the enmity of several friars, and for this reason he was probably removed from his administrative office in favor of more scholarly ones: in 1514 he became regent of the *Studium* in Naples, a role in which he was confirmed again a year after for the following 4 years. However, his contrasts with the Neapolitan friars remained unsolved, and it is probably for their escalation that he was sent to preach in Mantua in January 1517, provided with Giles of Viterbo's reference letters for the local convent and court. He succeeded in being nominated bishop of Lamos, *in partibus infidelium*, and suffragan bishop of Mantua. He spent his last 15 years in this city, dividing his time between

his pastoral duties and scholarly efforts. His stay in Mantua was however troubled in 1528 by his public siding in favor of Jacques Lefèvre d'Étaples' critique of the biblical figure of Mary Magdalene. The Mantuan court's devotion – and of the marquise Isabella in particular – for the biblical saint brought to severe contrasts, which reached their peak in the marquis' injunction to Flandino to leave the city. This turbulent phase could only be overcome thanks to the support of Cardinal Ercole Gonzaga, holder of the Mantuan bishopric. Flandino could thus spend his last years in Mantua, troubled by gout, which eventually led him to death at the beginning of December 1532 (Bacchelli 1997).

Almost all of Flandino's preserved works date from his years in Mantua. Alongside his wide production of sermons, his interest for platonic philosophy is clearly visible. The strong influence played on him by Erasmus has been demonstrated and so has its central role in the dispute which opposed Flandino and another Augustinian friar, Ambrogio Quistelli, initially on the figure of Mary Magdalene, but soon expanding to the role of pagan authors in Christian culture (Seidel Menchi 1981). Two of Flandino's writings originated from this dispute: the now lost *Apologia ex templo post resurrectionis festum*, dating from 1529, and the *Apologia ubi statur pro Ecclesiae doctoribus et patribus ac philosophis in eos qui negant citandos hos esse in concionibus* included in the 1532 sermon collection entitled *Seraphim*. In his later years, Flandino distanced himself from Erasmus, although not entirely, as testified in some of his writings, especially in the unfinished *Contra lutheranos de vera et catholica fide conflictationes* and *Examen vanitatis duodecim articulorum Martini Lutheri*, in which he took sides with Alberto Pio against the Dutch scholar and against Martin Luther and Gasparo Contarini (Gutiérrez 1976; Graiff 1978b; Seidel Menchi 1981). The best known among Flandino's works are, however, those against Pietro Pomponazzi. Already at the time of his earliest preaching in Mantua, Flandino attacked Pomponazzi's doctrine on the soul, though not making his name, and 2 years later (1519) he published his *De animorum immortalitate liber contra assertorem mortalitatis*, having also fostered Agostino Nifo's

writing on the same matter (Lemay 1976). Moreover, Flandino's debate with Pomponazzi was not only limited to the immortality of the soul but also contrasted his view on fate and human will with the *De fato contra Petrum Pomponatium*, composed in the mid-1520s and preserved in a single manuscript copy (Garin 1972; Lemay 1976; Graiff 1978a; Del Soldato 2010).

The following list of Flandino's works only refers to the ones which have been preserved (for mentions of other lost works, which include commentaries on Aristotle, on the *Sentences* and on Hermes, see Lemay 1976 and Seidel Menchi 1981). The dates of composition have been in most cases conjectured. The titles of secondary literature only include the main studies; further references can be found in them.

Abstract

During the Middle Ages and the Renaissance, the origin of tidal motions was hotly debated in various intellectual circles. The entry examines how in the early modern period the astrological interpretations of the phenomenon first put forth in the writings of Persian astrologer Abu Ma'shar were challenged; this, in turn, opened the door for a variety of other natural philosophical interpretations.

Heritage and Rupture with the Tradition

As is well known, two of the most famous early modern interpretations of tides are by Galileo Galilei and Isaac Newton, but the origin of this natural phenomenon was widely debated before the publication of Galileo's *Dialogo*. We still do not have enough evidence about ancient representations of tides; at least, none of the theories achieved consensus. According to some studies, the primary source of the ancient theories of tides is Pliny the Elder, who strongly influenced all

medieval authors concerned with natural history. In his *Naturalis Historia*, he states that an interaction between the sun and the moon on the basis of the fortnightly cycles causes the tides, but he does not go into much detail and gives no explicit explanation for the fortnightly cycle.

In the Middle Ages, many explanations for tidal motions were put forth. Some of them had a clear astrological background and were introduced in the twelfth and thirteenth centuries due to the transmission of Islamic knowledge in the West. There were three main tidal theories in the Middle Ages. The first admitted the existence of underwater chasms, which periodically drew in and forced out the water, and thus in analogy with breathing in an animal, caused the movement of the tide due to certain natural rules. The second theory, also of more physical nature, attributed tides to, among other things, the action of rivers and winds, the salinity of the water, or the natural heat of deep water. Finally, the third, astronomical/astrological theory was based on a recognition of the correlation between tides, diurnal rotation, and the lunar cycle. It dated back to Abu Ma'shar's *Liber introductorii maioris ad scientiam iudiciorum astrorum*, the most influential astrological "manual" in medieval Europe, and thus had a strong astrological dimension. Also, Abu Ma'shar contributed to an idea that besides the moon, other heavenly bodies including the sun and the planets also influenced the tides, which gave additional weight for the diffusion of pro-astrological explanations of the phenomenon. The theory was widely accepted in medieval Europe and gave rise to new interpretations of tidal motions. At the same time, Abu Ma'shar himself confirms that the tides can have dual origin: after a lengthy exposition on the astronomical/astrological origin of tides, he adds, as another cause of the phenomenon, the action of the winds.

Impact and Legacy

Even though in the fifteenth and sixteenth centuries some scholars continued to rely on Abu Ma'shar's ideas, the astrological interpretations

of tidal motions were challenged. It is worth noting that for medieval and Renaissance thinkers, the flow and ebb phenomenon dealt with debates of a more philosophical and theological character, namely, on how celestial impulses influenced terrestrial phenomena. While medieval scholasticism intended to reconcile Christian teaching with the newly discovered astrological knowledge widely legitimized with the use of numerous pseudo-Aristotelian texts, Renaissance scholars who questioned the predominance of the Aristotelian natural philosophical framework had, in turn, sought for new interpretations primarily devoid of astrological elements. Most of sixteenth-century Renaissance scholars followed Giovanni Pico della Mirandola, who tried to denounce the astrological explanation of tides in the *Disputationes adversus astrologiam divinatricem*, and came out with three major approaches to the problem in question. While according to vitalistic interpretations, the motion of water is caused by the subterrestrial impulses, some scholars, such as Bernardino Telesio, insisted that thermic changes might provoke the phenomenon. Finally, the third explanation, that of mechanical and mathematical origin, backed by leading late sixteenth- and early seventeenth-century natural philosophers, quickly became dominant. Described in the works of Simon Stevin and Marco Antonio de Dominis, the mechanical/mathematical cause of flow and ebb was analyzed in great detail in Galileo's *Dialogue Concerning the Two Chief World Systems*, in which it was considered one of the main arguments for the heliocentric system. However, Galileo's attempt to establish a link between the motion of the earth and the motion of water was later rejected as contradicting the theory of universal gravitation, according to which the tides occur depending on the position of the moon in its relation to the earth. Evidence suggests that since the 1687 publication of the *Principia* Newton's interpretation was widely accepted as the only reliable and scientifically proven. Thus, in the mid-eighteenth century, in his *Dissertatio de maris aestu* and some other writings, while exploring the origin of tides, Roger Joseph Boscovich known as the "Croatian Leibniz"

praised Newton's theory of gravitation claiming that it had been the greatest scientific achievement the world had ever seen.

Abstract

John Floyd is an English Jesuit priest, militant defender of the faith, and Counter-Reformation

author, also known under the pseudonyms Daniel à Jesu, I. R., A.C., Fidelis Annosus, and Hermannus Loemelius. Although nothing is known of his parentage, Floyd was the brother of Henry Floyd, also a Jesuit priest. Like other Jesuits with a mandate to teach and preach, Floyd traveled across the continent, wrote prolifically on a range of subjects addressed to a wide audience of clerics and lay readers, and published many works, challenging Protestant thinking and defending a Counter-Reformation papacy. Heavily influenced by scholasticism and the practices of medieval piety, Floyd's writings emphasize church teachings alongside scripture, but also maintain the active, visible, bodily presence of God.

Biography

Floyd received his schooling at the English colleges in Reims (1588) and Rome (1590) and joined the Society of Jesus in 1592. He began his scholarly career in Rome, instructing clergy in philosophy and theology at the Collegio Romano. Sent on the English mission, Floyd was captured when he visited a fellow Jesuit Edward Oldcorne and jailed for his alleged involvement in the 1605 gunpowder plot. Floyd was imprisoned for a year and banished from England upon his release, although he returned to England several times and was repeatedly arrested. Floyd taught at the English College, Louvain, from 1607 to 1616, and spent the rest of his life at the French Jesuit college of Saint-Omer, a setting which supplied him with “convenient access to the printing press” (Milward 2004).

Floyd's works are written in Latin or in an earthy vernacular and are notable for their harsh wit and sometimes caustic rhetoric. His theology is pragmatic and polemical, its terminology both legalistic and vividly imagistic. His *Apology for the Holy See* produced in support of papal authority incited the ire of French bishops (Basset 79–80), but his writings continued to receive the support of Rome, and nearly two dozen works

articulate Counter-Reformation positions on issues at the center of reformist debate, including priestly apostasy, the role of devotional images, the belief in Christ's real presence in the Eucharist, and the existence of purgatory (O'Malley 84). They respond to criticisms of Catholic superstition, defend the prerogatives of papal authority, and seek to explain how the antiquity and authority of the Catholic church are established through the sacraments (Mazzola 55, Dudley 279). English writers such as Sidney, Spenser, Donne, Shakespeare, and Milton were similarly influenced by reformation debates over "speaking pictures" and the efficacy of sacred signs.

Floyd's writings were intended for a wide readership including fellow Jesuits, Catholic clergy, and university theologians, as well as lay readers, for whom Floyd provided more popular formulations of post-Tridentine refinements of church teachings. In *The Overthrow of the Protestants Pulpit-Babels* (1612), Floyd proposes that although sacred images should not be worshipped, there "doth redound some kind of honour unto the very image" "represent[ing] him whom we worship with diuine worship, whom, did not the image resemble, we would not worship before it." Other works confront Floyd's opponents more directly, such as the Latin *Deus et Rex* (1619), which parodies Floyd's Anglican critics.

Floyd's works affirm Catholic teachings as providing sure access to the sacred past and to truth. In *Purgatories Triumph over Hell* (1613), Floyd links belief in purgatory with adherence to biblical doctrine as well as "happy purgation from heathenish superstition." Floyd also cites as proof of purgatory's existence "the miracles done at the Reliques & by the Intercession of Martyrs." This epistemology is influenced by the *Spiritual Exercises* of Ignatius of Loyola (founder of the Jesuits), which similarly expound the ways devotional practices enable believers to "taste, smell, and feel internally" the truths of doctrine.

Floyd's writings contribute to a post-Reformation Catholicism more clearly centered in Rome and an epistemology grounded in the literalness of church teaching, the efficacy of sacred objects, and the authority of the pope.

Abstract

An English physician, philosopher, and alchemist, Robert Fludd was Welsh in origins. His father, Sir Thomas Fludd, M.P., had been appointed as treasurer to the court of Elizabeth I. Between 1591 and 1598, Robert Fludd was reading for his master's degree at St. John's College, Oxford. In 1598–1604, he traveled on the continent where he was employed as tutor to the children of aristocratic French Catholic families. He also spent a winter in the foothills of the Pyrenees with a group of Jesuit priests, although, as he publically proclaimed, he was always a staunch Anglican. Fludd recorded that the priests taught him various magical

practices, not least the art of divination. This contact with the Jesuits probably colored Fludd's magical, as well as his religious, concepts to an extent hitherto underestimated by later scholars.

Alternate Names

de Fluctibus, Robertus; Fluctibus, Robertus de

Biography

On his return to England, Fludd undertook further medical studies at Christ Church College, Oxford, and in 1604 and 1605, he was awarded his degrees of M.B and M.D, respectively, after which he moved to London and attempted to gain entry to the College of Physicians. He was rejected six times due to his offensive remarks concerning the medical system of the ancient Greek physician, Galen, whose writings were the foundation of the university medical curriculum. In his place, Fludd was proposing the medical theories of the notorious sixteenth-century German theosophist, Theophrastus Paracelsus von Hohenheim. In 1609 Fludd was finally granted admission to the College of Physicians and was, thus, duly authorized to practice. Disregarding his new position in the medical establishment, the alchemical medicine and theosophy of Paracelsus and his followers continued to provide the foundation for Fludd's medical practice as well as his religious and philosophical ideas.

Fludd was a prolific writer of vast, multi-volume encyclopedias that described a universal range of topics from magical practices such as alchemy, astrology, kabbalism, and divination to a radical theologized cosmology concerning the interrelation of God with the natural and human worlds. At the same time, Fludd proudly displayed his grasp of practical knowledge, such as mechanics, architecture, military fortifications, armaments, military maneuvers, hydrology, musical theory and musical instruments, mathematics, geometry, optics, the art of drawing, chemistry, and medicine. Fludd employed a well-used

contemporary metaphor for these mundane arts, viz., that human endeavor was the "ape of Nature." Fludd achieved notoriety after he published his *Apologia* (1616), one of the earliest polemics written in support of the "Rosicrucian Manifestos." (He expanded this treatise into the *Tractatus Apologeticus* (1618)). The Rosicrucian Manifestos consisted of two texts, the *Fama Fraternitatis* (1614) and the *Confessio* (1615), which had been published anonymously in Kassel. They have been the subject of continuing debate among scholars ever since in respect to their origins and authorship. The existence of the Rosicrucians as an authentic grouping has never been proven. Nevertheless, they were supported by a heterogeneous group of prestigious Protestant religious reformers, among them, Johann Valentin Andreae and his colleagues in the theology school at Tübingen University. These may, in fact, have been the authors of the Manifestos. Other Rosicrucian followers included those magical practitioners and alchemists involved in the study of the late antique magus Hermes Trismegistos as well as the writings of Jewish and Christian kabbalists. These further subscribed to the more recent magical ideas of Cornelius Agrippa and of the religious philosophy of Paracelsus. All of these fellow travelers, like Fludd, may be loosely described as "Rosicrucians."

Fludd's most famous work is the *History of the Two Worlds (Utriusque Cosmi ... Historia, 1617–1621)* published in five volumes by Theodore de Bry in Oppenheim. The two worlds under discussion are those of the Microcosm of human life on earth and the Macrocosm of the universe (including the spiritual realm of the divine). Perhaps the most extraordinary aspect of Fludd's exhaustive and exhausting output is the range of copper plate engravings in his texts. Due to the originality of his designs and ideas, Fludd's visual images are likely to be the product of his own imagination. Kabbalistic elements were also included in the imagery. In comparison to several other remarkable visionary excursions into visual alchemy, most exceptionally, those of Heinrich Khunrath and Michael Maier, Fludd's illustrations remain unique and owe absolutely nothing to the visual imagery of his alchemical peers.

Furthermore, Fludd's cosmological system is an inventive reworking of Paracelsian alchemy. In his first volume of the *Utriusque Cosmi ... Historia*, concerning the "Macrocosm" (1617), Fludd devised a lavishly illustrated account of the origins of the universe, describing how its materials were separated out of Chaos by God acting in the manner of an alchemist, distilling and purifying the different elements. From the outset in the "Macrocosm" (*UCH*, 1617), Fludd's cosmos was structured by the three generative principles of Paracelsus's alchemy – those of light, darkness, and water. From these were generated three further primary elements – first the "Prima Materia," or salt; which arose from darkness; then the soul, or sulfur, which came forth from light; and, finally, the spirit, or mercury, which emerged from water. These three elements, in turn, produced four qualities (already established in antique and medieval physics), those of heat, cold, dryness, and moistness.

In the third book of the "Macrocosm," Fludd offered yet another, quite unique, interpretation of the structure of the universe, complementing his earlier alchemical visions, but, this time, expressed in musical form. He analyzed what he termed the "Musica Mundana," the musical structures underlying the cosmos. Fludd's musicology and his mathematical theories relied on those of the ancient Greek, Pythagoras (*UCH*, 1, 1617, pp. 79–81). The fifth chapter of the "Musica Mundana" included an illustration of the Cosmic Lyre that provided an analogy of the universal musical forms. Fludd's musicology has attracted much attention from twentieth-century scholars such as Godwin and Amman and, most recently, Hauge. The latter has defended Fludd against the dismissal by earlier researchers of Fludd's musical theories as being outmoded already in his own time. Hauge has reexamined Fludd's ideas and has demonstrated that they were, in fact, in the vanguard of contemporary musicology.

Fludd's medical treatises comprise the *Anatomiae Amphitheatrum* (Frankfurt: J. T. de Bry, 1623); the *Medicina Catholica* (Frankfurt: William Fitzer, 1629–1631); the *Philosophia Sacra* (Frankfurt: J. T. de Bry, 1626); the *Clavis Philosophiae* (Frankfurt: William Fitzer, 1633),

and the *Philosophia Moysaica* (Gouda: Petrus Rammazenus, 1638) which was translated into English as the *Mosaical Philosophy* (London: H. Moseley, 1659). Another important resource for Fludd's medicine, apart from Paracelsus, was the kabbalism of the Judaic *Sepher Yetzirah*. (He also mentions the *Zohar*.) Fludd drew even more heavily on the Christian kabbalism of the German humanist, Johannes Reuchlin, as well as on the ideas of Reuchlin's Italian exemplar, Giovanni Pico della Mirandola. Some of Fludd's most extraordinary imagery depicts a kabbalistic universe of letters and names centered on the letter "Vav," which, according to his ideas, refers to the Second Person of the Christian Trinity, Jesus Christ. In these texts, Fludd's medical practice is almost entirely devoid of chemical remedies but rather depends on prayer and the use of the name of Jesus (following the example of Christ's exhortation to his disciples to heal the sick in his name.) Accordingly, Fludd employed the Hebrew form of the name of Jesus since he claimed that this possessed immense magical power. He equated Jesus Christ with the kabbalistic angel Metatron, the heavenly form of the Jewish Messiah (*UCH*, 2 1621, pp. 2–5), who was the soul of the world. Fludd equated Metatron with the late antique Hermetic "anima mundi" or "Anthropos" (*UCH*, 2 1621, Tract II, Sect I, pp. 8–9).

Fludd went on to argue that the first manifestation of the Godhead in the Jewish kabbalah, "Hochmah" ("Wisdom"), was the same Hypostasis as the Second Person of the Christian Trinity who was Jesus Christ. He was the "Verbum" ("Word"), as in the first verse of the Gospel of John. In turn, the Christian "Word" is also the first letter of the Hebrew alphabet, "Aleph." The "Verbum," or Metatron-Christ-Messiah, as the form of God resides in the sun. Fludd's concepts of the creative and healing forces of the divine light of the sun were illustrated by diagrams, the principles of light and darkness being represented by two intersecting cones, or pyramids. The base of the "pyramidis formalis" was placed in the Empyreum of God, signifying rays of divine light shining downward, while the base of the "pyramidis materialis" was located on the earth pointing upward toward God. Fludd described these

diagrammatic forms as “pyramides lucis,” “cones of light,” claiming to have invented them himself, although they are, in fact, based on antique and medieval optical theory. Within the lozenge shape created by the intersection of the downward and upward pointing cones, Fludd placed the sun who balanced the oppositions of spirit and matter, male and female, and sulfur and mercury.

In Fludd’s medical theories, the operation of the aerial nitre, or quintessence, in the human body was of critical importance to health. The essence of the aerial nitre was the celestial light that originated in the tabernacle of the sun. It was breathed in by the lungs and carried to the heart, where it was separated from the air and dispersed as the vital spirit throughout the body. In his short text, the “Tractatus de Tritico” (“Tractate on Wheat”), which re-appeared in his *Anatomiae Amphitheatrum* (1623) and again in the *Philosophia Moysaica* (1638), Fludd described the distillation of the aerial nitre from wheat using the heat and light of the sun’s rays. Fludd claimed that this distilled spirit was the Universal Panacea, a generative celestial fire drawn out of the sun. In his account of this particular alchemical process, Fludd produces an extended exposition concerning the healing power and sacred nature of wheaten bread in a manner that clearly recalls the Roman Catholic doctrine of Transubstantiation. In fact, from his account Fludd’s Universal Panacea seems to be identical with the physical Body and Blood of Jesus Christ. Similar Eucharistic references are found in the writings of another contemporary English Protestant alchemist, Sir Kenelm Digby, who eventually converted to Roman Catholicism. (There were more Catholic alchemists practicing in that period in England, such as the members of the noble Clifford family, practicing at Skipton Castle in Yorkshire, although Lady Anne Clifford, the most famous alchemist, was herself a Protestant.)

This Roman Catholic aspect of Fludd’s alchemy has not been remarked, hitherto, by scholars. However, the recent study of John Donne’s Catholic alchemy by Albrecht has opened up the issue of Roman Catholic aspects in English alchemy. She has examined Marian references in Donne’s poetic imagery, but her

argument is suggestive, rather than conclusive. Comparing other types of Marian references in Fludd’s works, Szulakowska has identified at least one visual image with accompanying texts that alludes to Marian Catholic doctrine. In the first volume of *Utriusque . . . Cosmi Historia* (1617), there appears a large and very well-known engraved illustration of a naked woman standing in the midst of the cosmic spheres (Fludd, *UCH*, I, pp. 4–5). The engraving is entitled “Integra Naturae Speculum Artis Imago.” In his textual account, Fludd explains that the woman represents “Natura” as a virgin existing in the sublunar world of the four elements. Although she is not herself a divine goddess, she is the most intimate minister of God at whose command she governs the subcelestial worlds. In the engraving she is joined by a chain to the Empyreum above in which there shines the Hebrew name of God – the Tetragrammaton “Yahweh,” “YHWH” (Hebr., יהוה). The virgin in Fludd’s image is the Soul of the World, the “anima mundi,” who turns the spheres of the stars and nourishes all creatures. The sun is shown resting on her breast, while the crescent moon lies on her belly. Her hair is loose like that of an unmarried girl. The Marian associations in this picture are, specifically, the halo of twelve stars (one hiding behind her hair on the right) and the crescent moon. These, along with the loosened hair and her pose itself, bear close comparison to seventeenth-century Roman Catholic images of Mary as the Immaculate Conception. The attributes of the crown of stars and the crescent moon are the primary iconographic attributes of the Virgin Mary. They are derived from the account in the Book of Revelation, 12, of the Apocalyptic Woman: “Now a great sign appeared in heaven: a woman clothed with the sun, with the moon under her feet, and on her head a garland of twelve stars.” (Another image related to this particular context is that of the Assumption of Mary into heaven.) In fact, in his text Fludd provides an alchemical analogy to the unborn child of the Apocalyptic Woman when he refers first to the mercurial spirit living in the virgin’s womb. He further recalls the starry context of the Woman when he states that the virgin’s heart

gives light to the stars. The mercurial spirit, whom the philosophers call the Spirit of the Moon, is sent down from the virgin's womb to the center of the earth to quicken it into life. Catholic dogma taught that it was the Second Person of the Trinity, the Son (later manifested as Jesus) who had acted as the Creator of the universe.

The right foot of Fludd's virgin stands on the earth, while her left foot is in water which signifies the conjunction of sulfur and mercury in the alchemical art. The alchemical context of Fludd's "Natura" is equivalent to the Catholic dogma of Mary who, like Christ, was an intermediary between heaven and earth, incorporated physically into the spiritual realm after death, both human and divine. Nonetheless, Fludd's virgin has been modified to accord with alchemy theories, while the figure's nakedness relates her to medieval imagery of Eve. In Catholic dogma Mary was the second Eve. In another of his works, the *Tractatus Theologo-Philosophicus* (Oppenheim: Johann Theodore de Bry, 1617), Fludd also describes the virgin Psyche, daughter of Nature, as a pure bride. She is described in the context of the Holy Trinity as being a tabernacle of the Holy Spirit, an important attribute of the Virgin Mary. He states that this noble and most pure virgin is decked with divine light. She is the minister of life to all creatures, and the airy virtue of the God as the Holy Trinity, the Father and Son through the Holy Spirit of intelligence, has placed its tabernacle in her. The Virgin Mary in Catholic doctrine is depicted at her coronation in heaven as the Bride of the Trinity.

An imaginatively re-worked copy of Fludd's Cosmic Virgin is found in Daniel Johann Mylius' *Opus Medico-Chymicum* (Frankfurt: Luca Jennis, 1618). Fludd's Marian image may have also have influenced the contemporary treatises of the German Lutheran alchemist Jacob Boehme, who developed an even more strongly focused Catholic Marian presence as Maria-Sophia in his theosophical alchemy. Though it would be difficult to trace direct cross-influences, these certainly exist in the case of the illustrator to Boehme's collected works published later after his death in Holland who copied wholeheartedly from Fludd's illustrations (J. G. Gichtel, ed., *Boehme Des Gottseeligen*

Hoch-Erleuchteten Jacob Bomens Teutonici Philosophi Alle Theosophische Wercken, Amsterdam, 1682.) It may be the case that the development of the rich repertoire of Renaissance alchemical imagery was, in part, a compensation for the loss of Roman Catholic icons in the Protestant Reformation. Moreover, alchemists required recourse to Catholic Eucharistic doctrine in order to express and, more importantly, in order to validate, their own concepts of transmutation of substance. There are encountered other Marian references in Lutheran alchemy, namely, an image in Michael Maier's *Symbola Aureae Mensae Duodecim Nationum* (Frankfurt: Luca Jennis, 1617) and in Jacob Boehme's *Aurora Signatura Rerum oder Morgenrothe in Anfang* (1612.)

The standard authority in the secondary resources remains Allen Debus in his extensive studies of Fludd's Paracelsian and cabbalistic theology. Fludd's pictures have been examined in some depth by Joscelyn Godwin, though from the point of view of the twentieth-century Theosophy and the psychology of C. G. Jung. According to Yates, Fludd's visual imagery was integral to his theoretical concepts, and Szulakowska has attempted to redress the lack of scholarly analysis of the visual imagery. Other research on Fludd includes Amman's musicological study as well as the more recent one of Hauge. The most extensive discussion of Fludd's intellectual development has been provided by William Huffman, although he pays the closest attention to those of Fludd's works published in English, rather than the Latin sources.

Fludd's main admirer seems to have been another alchemist, the Count Palatine Michael Maier, but he was also heavily criticized, particularly by the astronomer Kepler in the *Mathematicae* (1622) for his faulty and outmoded cosmology. Fludd responded publically to Kepler in his treatises *Veritatis Proscenium* (1621) and *Monochordon Mundi Symphonicum* (1622). Fludd's theology was strongly criticized by Pierre Gassendi in his *In Fluddanae Philosophiae Examen* (1630) at the request of the theologian Marin Mersenne, and Gassendi rejected Fludd's typically Rosicrucian syncretism in which he treated alchemy, kabbalism, and Christian doctrine as

being of equal importance. Mersenne himself attacked Fludd for his Roman Catholic tendencies and use of magic in *Quaestiones Celebres in Genesim* (1623.) Fludd replied to Mersenne in *Sophiae cum Moria Certamen* (1629) and in *Summum Bonum* (1629.). On the other hand, a close supporter and similar Rosicrucian supporter was Michael Maier whom he may have encountered at the court of James I. (The details of Fludd's relations with the English king himself remain unknown.) Further, Szulakowska has suggested that there may have been some cross-influence between Fludd and Boehme, but this has not been conclusively established. There also exists an old tradition, according to A. E. Waite, that Fludd was one of the first Freemasons in Britain, being received into the order during the first years of its existence in Scotland, prior to its official inauguration in London.

It is difficult to find a successive lineage for the influence of Fludd's kabbalistic theosophy and his theosophical medicine. His main influence has, rather, been on the twentieth- and twenty-first-century artists and occultists. The early twentieth-century French avant-garde was fascinated by Fludd, and a notable follower was no less than Georges Bataille, the French Surrealist, whose own drawings display the influence of Fludd's cosmology. (Bataille was a librarian at the Bibliothèque Nationale in Paris where he was undertaking research into the occult tradition.) André Breton also mentioned Fludd in the company of Heinrich Khunrath and Johann Valentin Andreae. Joscelyn Godwin's (now out of print) volume in the Thames and Hudson Art and Imagination series popularized Fludd's imagery from the 1980s. Regrettably, in the field of academic scholarship, Fludd's work remains relatively little studied by the present generation since his vast volumes have rarely been translated out of their original Latin.

Abstract

The Benedictine monk Teofilo Folengo was the author of a macaronic poem entitled *Baldus* and of a series of minor macaronic texts written in Latin and the vernacular. While the poem *Baldus* has traditionally been considered a comic work, a parody of the then fashionable epic and chivalric poems, it has complex philosophical, religious, and allegorical meanings. Folengo, who took an active part in the religious controversies of his day, elaborated a peculiar take on reality. Dismissing some traditional aspects of Aristotelian philosophy and mixing theological ideas with Neoplatonic themes, Folengo shaped the image of a chaotic universe, in which Truth is apparently unattainable and paradoxical.

Biography

Girolamo Folengo was born in Mantua to Federico and Paola Ghisi. He entered the Benedictine Cassinese congregation in 1508 and took the name Teofilo, spending most of his life in Benedictine monasteries. During his travels he made the acquaintance of some of the most prominent contemporary Benedictine theologians. Folengo claims to have spent a period in Bologna where he studied under the philosopher Pietro Pomponazzi: however, there is no archival evidence to support this statement. The hypothesis of a Bolognese stay has in recent years been favorably reconsidered (Curti 1993). Between 1525 and 1530, Folengo lived in Venice, temporarily leaving his order to work in the service of the commander Camillo Orsini. In Venice he wrote

the *Chaos del Triperuno*, an allegorical work on the path to purification of the soul from the moment of its embodiment: the work relies on a multifarious series of philosophical (especially Neoplatonic) and theological sources, still largely unexplored (Folengo 1911; Carotti 2014–2017). From 1530 to 1533, he spent a period of hermitage together with his brother Giambattista, during which they lived for a while close to Naples. Here they made friends with the poet Scipione Capece (author of a philosophical poem entitled *De principiis rerum*). After Folengo was readmitted to the Benedictine order in 1530 (though he had never formally left it), he continued to travel around Italy – including a significant period in Sicily – until 1542, when he moved to the little church of Campese, near Bassano del Grappa, in the Veneto, where he died in 1544 (on Folengo's biography see Billanovich 2014).

Impact and Legacy

Folengo was one of the most innovative writers of the Italian Renaissance, praised and imitated by such diverse authors as François Rabelais, Erasmus, and Giordano Bruno. He was the first and last to use macaronic – a mixture of Latin and vernacular, especially local dialects – to write a successful and complex work, the poem *Baldus*, divided into 25 books. In this poem he drew from both the classical tradition of epic and contemporary chivalric romances to create an unprecedented work. The poem was first published in 1517, and subsequently reprinted, in different versions, three times. Folengo was also the author of biblical poems in the vernacular – among which *La Umanità del Figliuolo di Dio* (The Humanity of the Son of God 1533; Folengo 2000). This work employs ottava rima to develop a narrative based on the life of Christ, on the assumption that knowledge of the sacred text should reach as broad an audience as possible. As in many of Folengo's works, it is possible to find in both the *Baldus* and the *Umanità* ideas stemming from contemporary religious debates. In particular, Folengo was a supporter of the ideas later expressed in the *Beneficio di Cristo* (1543), an

important text for Italians influenced by the Northern European Reformation in these years. Like many Italian reformers, Folengo maintained that man is saved through Grace and not by good works, which are nevertheless fundamental as a form of co-operation in the process of Salvation.

In his works Folengo often mocks Aristotelian philosophy and philosophers lost in abstract theoretical discussions. In the *Baldus*, the fundamental terms of Aristotelian logic and metaphysics are represented in the form of flying insects crowding the so-called *Domus phantasiae* (The House of Fantasy; see Folengo 1997, 1030–1039; *Baldo*, vol. 2 [2007–2008], 473–479; Carotti and Macinante 2015). The fundamental rejection of Aristotelian philosophy should be seen in the context of a return to the purity of the Gospel. It is in this sense that one should also read the statement concerning Ptolemaic cosmology in the sacred poem *La Palermitana* (Folengo 2006, 86). Here Folengo, on biblical grounds, rejects the division of the sky into different spheres. Folengo might also have drawn on theories developed at the beginning of the 1530s by the philosopher and astronomer Basilio Sabazio (Faini 2010; on Sabazio, see Bacchelli 1990, 2019).

The choice of macaronic language, in which high and low are mixed, seems to reflect the peculiar structure of Folengo's universe, in which there is no such thing as a celestial world, free from sublunar corruption and chaos. Chaos pervades the whole world, represented as turned upside-down. The mission of *Baldus* is precisely that of conquering Hell and restoring the lost order in the world. Yet he fails and ends up inside a huge pumpkin, symbolizing vanity, where he meets the poet himself who is being punished there for having written nothing but lies. The poet thus claims to be a liar, a paradoxical statement that discloses the impossibility, in Folengo's world, of attaining Truth.

Abstract

Pedro da Fonseca, S.J., was a Jesuit philosopher in the sixteenth century during Iberia's second scholasticism. Known as the “Portuguese Aristotle,” Fonseca helped organize and oversee the massive project known as the *Cursus Conimbricensis* that commented on many of the works of Aristotle. Fonseca also helped devise and implement the Jesuits' *Ratio Studiorum*, which was a kind of ground plan

for the nature and dynamics of Jesuit education. Fonseca himself contributed to Jesuit education with the composition of his *Institutionum dialecticarum*, which was an eight-volume treatise devoted to logic and was eventually adopted as an official textbook at a number of Jesuit universities. Fonseca also produced a critical edition of Aristotle's *Metaphysics*, to which he added a Latin translation and commentary. Later in life, Fonseca authored yet another logical text, a shorter one this time: the *Isagoge philosophica*. Fonseca died in Lisbon in 1599.

Biography

Pedro da Fonseca, S.J. (Cortiçada, Portugal, 1528–Lisbon, Portugal, 4 November 1599), also known as the “Portuguese Aristotle,” was born in Cortiçada (Proença-a-Nova), Portugal. He joined the Society of Jesus on 17 March 1548 (Solana 1940, p. 339). In 1551, shortly after having completed his novitiate, Fonseca enrolled in the University of Évora, where he functioned both as a student and teacher, there studying theology between 1552 and 1555 and teaching philosophy between 1552 and 1553 (Doyle 1998, p. 688). From 1555 to 1561 he taught in the faculty of arts at the University of Coimbra, which King John III of Portugal had recently placed under the care of the Society of Jesus (Doyle 2001, p. 15). It was during that time that Fonseca devised the *Cursus Conimbricensis*, which was an ambitious project produced by the Jesuit professors of the University of Coimbra (the *Conimbricensis*) consisting of several volumes of commentary on the *Corpus Aristotelicum*. The texts commented upon included: *Physics*, *De caelo et mundo*, *Meteorum*, *Parva naturalia*, *Nicomachean Ethics*, *De generatione et corruptione*, *De anima*, and *Organon* (Doyle 2001, p. 16).

After his time at Coimbra, from 1561 to 1564, Fonseca's work was more administrative than professorial (Doyle 1998, p. 688). Nevertheless, in 1564 the Jesuit published his important *Institutionum dialecticarum*, a text that, like the

Logica mexicana of Ant^onio Rubio, achieved great popularity and success, underwent several editions, and was eventually adopted as an official textbook at several Jesuit schools throughout Europe and beyond (ibid.), and likely ended up as an official text at La Flèche where it could have had an impact upon Descartes (Ashworth 1997, pp. 47–48). Fonseca returned to Évora where, in 1570, he received his doctorate in theology and became the university's chancellor (Doyle 1998, p. 688). Throughout the 1570s–1582, Fonseca once again served the Society of Jesus in a number of administrative capacities, which eventually lead to his moving to Rome, where he functioned as assistant to the Jesuit provincial of Portugal. In 1581 he contributed to yet another project; together with 11 other Jesuits, Fonseca was charged by the Superior General, Claudio Acquaviva, to develop the *Ratio Studiorum*, the Jesuit pedagogical plan (Doyle 2001, p. 15). A draft of the *Ratio Studiorum* emerged as soon as 1586, but it was not until 1599 and after many revisions and adaptations that it was officially adopted for use in all Jesuit schools (Fichter 1940, pp. 140–144).

While busy devising the *Ratio Studiorum*, Fonseca was also composing a commentary on Aristotle's *Metaphysics*, which was published in Rome in 1577. The text is remarkable in many ways. In addition to its comprehensiveness and lasting influence upon other Jesuit intellectuals such as Francisco Suárez, Fonseca establishes himself as more than a capable philologist (Schmutz 2014). Included in the commentary is a critical Greek text that Fonseca himself established from both printed editions and available manuscripts. Not only does Fonseca offer a commentary on the Aristotelian text but he himself also provides a Latin translation (Solana 1940, pp. 344–345).

In 1582 Fonseca left Rome to return to his native Portugal where he became the superior of the Jesuit house of San Roque in Lisbon and also served as the Visitor of the Jesuit province in Lusitania (ibid., p. 339). In 1591 Fonseca composed a second but relatively shorter treatise on logic: the *Isagoge philosophica*. Of concern in this text are the nature of universals, the

particulars, and the process of abstraction. A year later in 1592, Fonseca returned to Rome to prepare for the Fifth General Congregation of the Society of Jesus, which would open in 1593 (Doyle 2001, p. 15). In addition to addressing various political concerns stemming from tensions between the papacy and the king of Spain, significantly, the Fifth General Congregation reaffirmed that Thomas Aquinas would be followed in matters of theology and Aristotle in philosophical issues (Padberg 2006, p. 29). In 1598 Fonseca, still tending to Jesuit pedagogical concerns, produced yet another redaction of the *Ratio Studiorum*. Eventually, Fonseca returned to Lisbon where he died on 4 November 1599 (Solana 1940, p. 339).

Logic

Fonseca's principle contributions to the history of philosophy reside in logic and metaphysics. By and large, his most detailed thinking on logic can be found in the eight books of his *Institutionum dialecticarum* (*ID*), and he also composed a smaller treatise, the *Isagoge philosophica* (*IP*), which consists of only 66 folios arranged in 12 chapters.

Isagoge philosophica

The first half of the volume deals with matters related to universals, particulars, and abstraction, whereas the second portion treats various kinds of universal. Chapter one addresses the nature of universals in general. A universal of its own nature is apt to be in many things, explains Fonseca, as “animal” is in several animals and “man” is in several men, and thus it is naturally apt to be predicated of several things (*IP*, c. 1; fol. 5). Yet, one should not consider a universal, Fonseca warns, as some one thing that is in each of the things of which it is predicated (ibid.; fol. 6). Nevertheless, the universal does point to a more than mere nominal identity among things similarly predicated since each has the same ratio (ibid.).

In the second chapter, Fonseca goes on to explain that there are four modes of universal,

each following upon the degree of unity that the ratio of the universal has within each particular falling under its scope. Here, Fonseca seems to have in mind a sort of analogical unity (though he does not use the term) as he gives the quintessential example of health (as well as sickness) and the diverse – but proportionally unified – *rationes* that emerge among those things denominated “healthy.” Thus, the first mode of universal pertains to those things having “one and the same *ratio*” but in such a way that they are “sometimes excluded from equivocity” (ibid., c. 2; fol. 10). Fonseca appeals to being – which, though one in itself and most universal, is said in many ways but not equivocally – as an instance of such universal (ibid.). The second mode of universal, continues the Jesuit, is such that those things of which the universal is predicated have one and the same *ratio* resulting from their sharing in a nature that is located in one of the ten categories (ibid.; fol. 11). The third mode occurs wherein there is one and the same *ratio* that is unequally participated so as to impede univocal predication of the *ratio* of its participants (ibid.). Finally, with the fourth mode, there is, again, one and the same *ratio*, except that only what falls within the definition of the universal *simpliciter* and absolutely is considered (ibid.; fol. 11–12).

In chapter three Fonseca discusses particulars and how they can be the “subjects” of various universals, for example, “Socrates [as the subject of] man, and man [the subject of animal]” and the like (ibid., c. 3; fol. 13). The relation of a particular to universals results in the latter being subject to greater or lesser degrees of universality. For example, Fonseca notes that “man and white” are less universal, while “animal and color” are more universal. Greater still are “substance and quantity,” which are “maximally” universal (ibid.; fol. 14). Ultimately, as Fonseca sees it, the singular or individual is that which, of its own nature, cannot be in or predicated of many things (ibid.).

Chapter four – which some regard as the most original element of Fonseca’s *Isagoge philosophica* (Solana 1940, p. 342) – pertains to the abstraction of universals from singulars. Abstraction occurs, Fonseca holds, with the “ministration” or assistance of the senses, which gather

certain “species of natural similitude” – and not common natures themselves – from singular things in which no individuating differences are represented (*IP*, c. 4; fol. 19). Fonseca explains that any faculty of knowledge abstracts certain species from things and separates their own proper objects from the objects of other faculties (ibid.). This is true not just of intellectual faculties but, significantly, of sense powers as well. Here, Fonseca gives the example of sight as it perceives butter. Though in butter there simultaneously exist various sensible qualities such as whiteness, sweetness, particular odor, and softness, the Jesuit notes that sight “abstracts” the aspect of whiteness from the singular thing leaving behind, as it were, the other sensible qualities (ibid.; fol. 19). Similarly, yet in a more noble fashion because of its immateriality, the intellect is able to perceive universals that are abstracted from singulars that are of a higher nature than sensible species and are called *intelligibiles* (ibid.; fol. 20). In short, for Fonseca, abstraction is of two kinds: one made through the sensitive power and the other made through the intellect. Through the former, an object separated by a sense power is represented in a species; through the latter, what is separated is known (intelligibly) precisely as such (ibid.; fol. 23). The remainder of the chapter then discusses in a rather straightforward Aristotelian fashion the process of abstraction beginning with sensation, moving through phantasms, to the work of the agent and possible intellects. What is somewhat peculiar about Fonseca’s account, however, is that he thinks the possible intellect is capable of knowing singular beings, albeit in a fashion that is much superior than what sensation achieves (Solana 1940, p. 343).

In chapter five Fonseca addresses the relationship between universals-particulars and dialectics. Of particular interest to the Jesuit here is the relationship that universals have to particulars in terms of cause and effect. Cause and effect can be considered in three ways: first, inasmuch as they are things themselves, as the sun inasmuch as it is the sun or gold inasmuch as it is gold – to use Fonseca’s examples; or, second, either as a cause and or as an effect, as the sun generates gold or as gold is generated by the sun; or, finally, as cause

and effect are referred to one another, as cause to effect or effect to cause (*IP*, c. 5; fol. 25). Fonseca holds that a universal's relation to a particular can be understood in the same manner. First, a thing can be considered without reference to having the character (*ratio*) of universality or particularity as "animal" or "man" may be considered *per se* or simply in themselves. (Here, one is reminded of Avicenna's teaching when he says *equinitas est tantum equinitas*.) Second, these same things can be considered as either universals or particulars, for, the Jesuit explains, it is one thing to be in an animal (*in animali est*) or to be an animal (*esse animal*) and another thing to be "common to man and beast" or as that which agrees with all animals (*ibid.*; fol. 25). Third, universals and particulars can be considered in terms of their mutual relationship to one another, universals as a certain kind of total community and particulars as certain parts of a subject (*ibid.*; fol. 26).

The sixth chapter explores the unity that universals possess. Here, Fonseca holds that there are two kinds of unity: one "formal" and the other "prescise" (*ibid.*, c. 6; fol. 28). Formal unity, says Fonseca, is "nothing other than the undividedness of a universal thing in itself, that is, in its nature or in its definition [*ratio*], which is how 'animal' is undivided in that which is an animal and 'man' in that which is a man" (*ibid.*). The undividedness of formal unity is merely negative (*ibid.*; fol. 30) or non-exclusionary and results from the community that arises among several individuals that share in some communicable property such as a nature or form. Fonseca also describes such unity as pertaining to the properties of universals as things (*ibid.*; fols. 29–30). Formal unity does not presuppose an aptitude of the universal thing to be in many of itself (*ibid.*; fol. 30). In contrast, prescise unity, says Fonseca, consists in the privative (*ibid.*) undividedness of the universal thing, not in itself, but in its particulars, as occurs, for example, in the undividedness of "animal" as it is found in a man and a beast or "man" as found in Socrates and other men (*ibid.*; fol. 29). Prescise unity concerns the properties of things as they are apt to be in several things (*ibid.*; fol. 30).

In chapters seven through eleven, Fonseca treats successively the five Porphyrian universals, namely, genus (c. 7), species (c. 8), difference (c. 9), properties (c. 10), and accidents (c. 11). The work then concludes with a chapter (the twelfth) devoted to other kinds of universals "unknown to heathen philosophers." Here, of central concern for Fonseca are the implications involved with the Incarnation in which "God" and "man" are predicated of the singular Christ (*ibid.*, c. 12; fol. 61). The Jesuit maintains that whenever anything about God is predicated of Christ, such predication has no character of universality, which is not to say that the divine is merely a singular thing, but is maximally singular (*ibid.*; fol. 62). The situation is different, however, when things pertaining to human nature are predicated of Christ. "Human" and "human attributes" are not predicated of the divine Word with necessity but only contingently (*ibid.*; fol. 63). Nevertheless, Fonseca insists, Christ's human nature is not united to the Word accidentally (*ibid.*; fol. 64). Here, the Jesuit notes that none of the modes of universals known to the "heathen philosophers," viz., quidditative, essential, necessary, generic, specific, or difference, will suffice to account for the manner in which human nature is predicated of Christ, for the two (the divine and human), Fonseca holds, are united substantially (*ibid.*; fols. 64–65). Thus, the kind of predication involved is "substantial predication," which Fonseca regards as neither essential nor accidental (*ibid.*; fol. 66).

Institutionum dialecticarum

Substantially longer than the *Isagoge philosophica*, Fonseca's earlier work on Aristotle's formal logic, the *Institutionum dialecticarum*, runs throughout eight books. The work has all the classic characteristics of a textbook intended for classroom instruction; it is precise, clear, and concise (Solana 1940, p. 340). It is no surprise, then, that the text was adopted by the Jesuits for use in their courses offered not only within Europe but also in the New World and Far East (Doyle 1998, p. 688).

The *Institutionum dialecticarum* opens with a discussion of the necessity, terms, and nature of

logic. Fonseca notes that one and the same art is properly described as either “logic,” as the Peripatetics called it, or “dialectics” as the ancient philosophers named it (*ID*, I, c.1; fol. 7). According to these ancient philosophers, dialectics is rightly defined as a “quasi art” that teaches formulas of differentiating (*differendi*) (*ibid.*). But after having described this art as “dialectics,” Fonseca immediately distinguishes the nature of the present work from the “dialectics” – which only concerns probability – that Aristotle articulated in his *Topics* (*ibid.*, I, c. 2; fol. 8). Over the next 30 chapters, Fonseca addresses various elements pertaining to logic or dialectics, such as its subject matter – which is the proposition (*oratio*) – whereby the unknown is made known (c. 3); three modes of differentiating, viz., division, definition, and argumentation (c. 4); nouns and verbs – some of which are fabricated by the mind, some spoken, and others written (cc. 7, 12, 14); signs and signification (cc. 8–10); middle terms (c. 11); univocal terms (c. 21); comparison of equivocal, analogical, and univocal terms (c. 22); difference between concrete and abstract nouns (c. 23); common and singular terms (c. 26); and transcendental and non-transcendental terms (c. 28), among many other topics. Regarding transcendental terms, Fonseca follows Thomas in identifying them with what is said of all true beings, viz., *ens*, *unum*, *bonum*, *aliquid*, and *res*. While the Jesuit seems to leave no room for the Scotistic disjunctive transcendentals or pure perfections, he does open a space for the consideration of super-transcendentality, understanding it as that which is “opine-able, thinkable, apprehend-able, and the like,” which are affirmed of all beings and not only “true beings” (*ID*, I, c. 28; fol. 35).

The second book of the *Institutionum dialecticarum* examines the nature of universals, which would be revisited in greater detail later in the *Isagoge philosophica*. As would be the case in that later text, in the present work Fonseca begins with a general consideration of universals before examining in the characteristics of the five Porphyrian universals as well as universals found in each of the Aristotelian categories in successive chapters.

Book three explores the nature of propositions, which Fonseca defines as “a voice [*vox*] signifying out of custom, of which some of its parts signify separately, such as: ‘Socrates is a philosopher,’ ‘Socrates is wise’” (*ibid.*, III, c. 1; fol. 56). In the remaining chapters of book three Fonseca then explores various kinds and divisions of propositions. The first division mentioned is that between a perfect and imperfect proposition. A perfect proposition, he says, is one in which some complete or express thought (*integra sententia*) is declared, for example, “God is the highest good” (*ibid.*, III, c. 2; fol. 57). In contrast, an imperfect proposition is one in which an incompletely expressed thought is signified (*muta sententia*), for example, “To be afraid of God” (*ibid.*). Fonseca then divides enunciations or judgments into two kinds: simple and conjoined; he further subdivides the former into simple absolute and simple modal (*ibid.*, III, c. 3). In short, as he sees it, a “perfect proposition” is such that it is either true or false (*ibid.*; fol. 58). A simple proposition is one in which “one thing” is expressed, for example, “Man is an animal,” “Man is a rational animal,” “A just man is prudent,” and the like. A conjoined proposition (*enunciatio coniuncta*) is hypothetical, for example, “If it is day, it is light” (*ibid.*; fol. 59). An absolute proposition, continues Fonseca, is one that “signifies something absolutely to belong [*inesse*] or not belong to [*non inesse*] something else,” for example, “Man is an animal,” or “Man is not a rock” (*ibid.*). Finally, according to the Jesuit, a modal proposition is one wherein the mode of something’s belonging to (or not) is expressed, for example, “Man is necessarily an animal,” “Man is, of necessity, not a stone,” “It is necessary for man to be an animal,” and “It is necessary for man not to be a stone” (*ibid.*). The remainder of the chapter discusses various aspects of propositions, quantity, quality, etc., and their relations according to the square of opposition.

Book four of the *Institutionum dialecticarum* studies “division.” Division is treated in a number of distinct sciences, including metaphysics, but the sort that dialectics or logic is concerned with, Fonseca says, is with the parts into which a proposition is divided. A whole, for example, “man” or

“animal,” is that which can be divided into parts such as when one says that “Of a human, one part is the soul and the other the body” or “Of an animal, some are man and others beasts” (ibid., IV, c. 1; fol. 94). At issue here are logical distinctions (c. 2). This discussion gives Fonseca a reason to address how distinctions among genera and species and even of reason affect one’s metaphysical considerations (c. 5).

In the fifth book, Fonseca moves onto an exploration of “definition.” “A definition,” says Fonseca, “is a proposition that declares some essence or nature: as [for example] ‘rational animal;’ for it [the definition] declares the nature of a name” (*ID*, V, c. 1; fol. 109). Put simply, a definition attempts to explain, as it were, an essence or quiddity through placing that thing into its proper divisions of genus and species (ibid.). A definition is properly a proposition, Fonseca holds, since no name, being only one word [*vox*], is adequate for the purposes of a definition, which, at the very least, requires two concepts that are synthesized in a proposition (*enuntio*).

The sixth book concerns “consequence,” which, as Fonseca sees it, is a certain kind of argument. More specifically, “consequence” is a “kind of proposition in which, from something, another thing is known, as for example, [from the claim that] ‘every man is an animal; therefore some man is an animal’” (ibid., VI, c. 1; fol. 128). A “consequence,” then, can also be called a “conclusion” as it is inferred from some antecedent (ibid.). Of particular concern for Fonseca in the present book is the structure of a syllogistic argument, which, ultimately, results in a conclusion or “consequence,” its valid as well as invalid forms (c. 2), formal and material consequences, i.e., necessary or probable conclusions (cc. 3, 4), as well as rules governing arguments in general (c. 5). Fonseca offers a very lengthy discussion concerning immediate and mediate inference and lays out the nineteen rules for valid syllogistic inference through the by-then popular mnemonic poem relating universal affirmative, universal negative, particular affirmative, and particular negative (A-E-I-O) propositions: “*Barbara, Celarent, Darii, Ferio, Baralipon/ Celantes, Dabitis, Fapesmo, Frisesomorum/ Caesare,*

Camestres, Festino, Baroco, Darapti/ Felapton, Disamis, Datisi, Bocardo, Ferison” (ibid. VI, c. 13; fol. 147).

Book seven treats the division of simple syllogisms into four genera and is concerned with demonstration. Here, Fonseca treats the material that can be found in the *Posterior Analytics*, namely, the demonstrative character of scientia as either *propter quid* or *quia* (ibid., VII, c. 2; fols. 182–83). In this book the Jesuit addresses issues such as middle terms (c. 5); dialectical syllogisms which only yield probable conclusions (c. 6); *locus*, that is, the position elements have in an argument (c. 9); and two kinds of loci, viz., *maxima* and *differentia maxima* (the former concerns self-evidence but the latter involves authority (c. 10).

The *Institutionum dialecticarum* finally concludes with an eighth book devoted to fallacies. After spending nineteen chapters discussing various kinds of fallacies, such as the fallacies of composition and division, affirming the consequent, *petitio principii*, and many others, Fonseca moves onto a treatment of supposition, which, following Aristotle, he defines as “the acceptance of a name that signifies a thing” (*ID*, VIII, c. 20; fol. 286). Fonseca marks a distinction between formal and material supposition, which distinction basically amounts to the claim that something has formal supposition when it signifies something other than itself. Material supposition, however, signifies itself, for example, “‘Man’ is a noun; ‘Blictri’ is a voice [*vox*] that signifies nothing” (ibid., VIII, c. 21; fol. 288). Fonseca’s treatment of supposition occurs over fifteen chapters, after which he then addresses “ampliation,” “restriction,” and, finally, appellation (ibid., VIII, cc. 41–42).

Metaphysics

One is hardly surprised to find that Fonseca’s thought on metaphysics is found most expressly in his *In libros Metaphysicorum Aristotelis Stagiritae (In met.)*, which, as noted above, contains both a critical Greek edition and Latin translation of the Aristotelian text. The work is

contained in four volumes published over a number of years. The first volume, published in Rome in 1577, covers the first four books of the *Metaphysics*. Also published in Rome in 1589, the second volume is devoted entirely to the fifth book of the *Metaphysics*. Moving on to a treatment of books six through nine, the third volume of Fonseca's commentary was published in Cologne in 1604. Finally, the fourth volume, which explores books 10–12 and offers a translation of books 13 and 14, was published in Lyon in 1612 (Solana 1940, p. 344).

The work is organized in a threefold manner. First, as noted above, Fonseca prepares a critical edition of the Greek text presented side-by-side with a Latin translation. Second, the Jesuit offers an *explanatio* of the text, the meaning of certain words, and key phrases through adverting to other commentaries on Aristotle as well as using other Aristotelian texts to illuminate the Stagirite's meaning (Solana 1940, p. 345). Finally, Fonseca concludes with "questions" that arise from the topic under discussion. The procedure of these "questions" has been described as thoroughly "scholastic" (indeed one might say they are adumbrations of Suárez's own *Disputationes metaphysicae*) in that they propose a variety of sententiae together with objections as well as reasons for and against the positions entertained – all before offering his own conclusions (*ibid.*).

Perhaps that part of Fonseca's metaphysical commentary which reveals most clearly his own unique thinking on the nature of metaphysics can be found in the *quaestiones* pertaining to the fourth book of the *Metaphysics*. This particular book, as is well known, attempts to determine both the scope and nature of the first philosophy. In it, Aristotle states that the first philosophy has being as being for its proper subject. Yet, in *Metaphysics* 6.1 he then argues that separate substances or the gods form the proper subject of the first philosophy. This tension within the text generated not only obvious interpretive difficulties but also metaphysical debates between not only Avicenna and Averroes but also succeeding generations of medieval and scholastic philosophers. It is within that context and its tradition that Fonseca raises his first *quaestio* which asks whether "being [*ens*],

inasmuch as it is common to God and creature, is the subject of metaphysics?" (*In met.*, IV, c. 1, q. 1). In answering this question Fonseca notes and refutes arguments to the contrary, which hold that God is its proper subject. Somewhat like Scotus, but departing from Thomas, Fonseca maintains that the proper subject of metaphysics is being insofar as it is common to God and creature (*ibid.*, IV, c. 1, q. 1, s. 2). Unlike Scotus, however, Fonseca holds that *ens commune* is analogical.

Naturally, Fonseca explains the analogical character of being in the questions stemming from the second chapter of *Metaphysics* book four. Following the standard scholastic practice, he first notes the opinion that the community arising from being is equivocal – which Fonseca identifies as the position of Moses Maimonides and also Petrus Aureoli (*In met.*, IV, c. 2, q. 1, s. 1; cols. 689–91) – followed by the position, famously defended by Scotus and his disciples, which holds that the concept of being is univocal (*ibid.*, IV, c. 2, q. 1, s. 2; cols. 691–94). The Jesuit rejects both theories. Being cannot be equivocal, Fonseca thinks, since it would flatly contradict the teaching of Aristotle who held that, though being is said in many ways, is not said "equivocally" (*ibid.*, IV, c. 2, q. 1, s. 3; col. 694); this would render knowledge of God through creation impossible, as Thomas argued (*ibid.*; cols. 694–95), and it would destroy the scientific unity of metaphysics if being as said of substance were entirely diverse from being as said of accidents (*ibid.*; col. 695). Nor is the concept of being univocal, insists Fonseca. Aristotle says that being is said in many ways but multiplicity is opposed to the unity that would result from univocity (*ibid.*, IV, c. 2, q. 1, s. 4; col. 695). Additionally, the Jesuit argues that if being were univocal, then it must be a genus; but being cannot be a genus; therefore, it cannot be univocal (*ibid.*; cols. 695–96). (Apparently, Fonseca was unaware that Scotus himself held both that being is not a genus and that nevertheless its *ratio* is univocal.) If neither equivocal nor univocal, Fonseca concludes that the character of being (*ratio entis*) is analogical, which the Jesuit understands to be simply the teaching of Aristotle (*ibid.*, IV, c. 2, q. 1, s. 5; col. 700).

Though the *ratio* of being is analogical, Fonseca does admit that being need not always be predicated analogically of all things, for there are some beings that share being univocally, namely, those things that have the same nature, whether generic or specific (ibid., IV, c. 2, q. 1, s. 5; col. 700). In fact, the Jesuit maintains that, in itself, the ratio of being is not one *simpliciter* but is such that its unity results from a relation or comparison of many beings (ibid.; col. 701). Here, then, Fonseca seems to allow for a greater degree of multiplicity in the concept of being than his order brother, Suárez, who insists on the absolute unity of the concept of being (*DM* 2.2.36), is willing to admit. For the medievals and their scholastic successors – especially those following in the wake of Cajetan, whom the Jesuit cites explicitly (ibid., IV, c. 2, q. 1, s. 6; col. 701) – “analogy” is said in many ways. Fonseca himself, in the task of explaining the sort of analogy that governs the community of being that forms the subject of metaphysics, identifies, along with Cajetan, an analogy of inequality (which, Fonseca says, does not necessarily impede univocity) as well as analogies of proportion (*proportio*) and attribution (ibid.). Reminiscent of Boethius’s own distinctions within *aequivoca a consilio*, Fonseca further subdivides an analogy of proportion into *ad unum* and *ab uno* (ibid.; col. 702A-B). Then, noting Thomas’s distinctions in *Summa theologiae* I, q. 13, a. 5, the Jesuit subdivides analogies of attribution into *unius ad alterum* and *duorum ad tertium* (ibid.; col. 702D-F).

With these distinctions in place, Fonseca denies that the community of being extending to God and creature can be understood in terms of an analogy of attribution *duorum ad tertium*, for the reason that there is nothing besides God and creation in virtue of which both can be called “being” (ibid., IV, c. 2, q. 1, s. 7; col. 704D). The Jesuit also points out that an analogy of attribution *unius ad alterum* with respect to a creature cannot obtain either, for God is not called “being” through attribution to a creature (ibid.). Nor can there be an analogy of attribution with respect to creation’s relation to God as the prime analogate for the reason that – somewhat as Cajetan had maintained – such an analogy would imply that

“only God is formally being [*ens*],” which means that “it would be necessary that, inasmuch as it is a being [*ens*], a creature would be defined through God,” which Fonseca thinks is patently false since a creature is properly defined as “that which is able to exist in reality [*rerum natura*]” (ibid.; 704E). Accordingly, Fonseca concludes that the analogy pertaining to common being is one of proportionality or, what is the same, “an analogy of proportion” (ibid.; col. 705A). “As God is related to His being,” Fonseca explains, “so is a created substance proportionally related to its own [being]” (ibid.; col. 705C). Similarly, the relationship between a substance and its accidents is proportionally maintained in the relationship between “one class [genus] of accident and its own existence,” and, finally, “the character [*ratio*] of real being is of the same [proportional relationship] to the character [*ratio*] of beings of reason” (ibid.). In short, “there is in all things an equal proportion, although things themselves and also existence itself taken per se are of diverse modes” (ibid.; col. 705D).

Be that as it may, though he favors proportionality, Fonseca does not abandon attribution but accords it a critical role in his metaphysical project. While he rejects the claims of those who hold that only substances have being formally, such as Agostino Nifo and Aegidius Romanus maintained (ibid.; col. 706A-B), Fonseca grants that accidents are called “being” on account of their relation to created substance (ibid.; col. 706C). Thus, when what is at issue is the relationship between accidents and substance such that the former are called “being” precisely on account of their relationship to the latter, the analogical community at hand is one of *duorum ad tertium*. But, when considering the relationship that one accident has with a substance, Fonseca explains that the resulting analogy is one of attribution *unius ad alterum* (ibid.; col. 706C-D). These divisions of attributions have germinal seat in the text of *Metaphysics* 4.2 itself as well as in the philosophical tradition that followed, especially Thomas Aquinas, but what seems to be unique to Fonseca is that he extends an analogy of attribution to accommodate the relationship between real being (*ens reale*) and beings of reason (*entia rationis*). As he sees it,

beings of reason stand in a relation of dependence upon real being in the same way that accidents stand in relationship to some substance. Fonseca notes that “beings of reason do not depend upon real being less than accidents [depend] upon substance” (ibid.; col. 706E). Fonseca’s position regarding beings of reason stands in rather stark contrast with the position of Suárez; it is worth noting, who only admits an analogy of proper proportionality, which the *Doctor eximius* regards as always extrinsic, between real being and beings of reason (*DM* 1.1.5; ibid., 54.1.9). Indeed, Suárez thinks that beings of reason do not even fall under the common objective concept of being (ibid., 1.1.4), for which reason they do not properly pertain to the adequate object of metaphysics (ibid. 2.2.1).

Fonseca, however, seems more sanguine about the role of beings of reason within metaphysics, but with this outlook the question naturally arises about the character that the (analogical) concept of being has with respect to its extension and unity. One is not surprised, then, to find that Fonseca turns his attention to this important topic in the immediately succeeding question which enquires into formal and objective concepts. A formal concept, writes Fonseca, “is nothing else than the actual similitude of a thing, which is understood, produced by the intellect to express the [known] thing” (ibid., IV, c. 2, q. 2, s. 1; col. 710C). He gives as an example the intellect that understands human nature by producing a similitude of human nature through which human nature is expressed and known (ibid.; col. 710D). Fonseca explains that this concept is called “formal” because it is a certain accidental form inhering in the intellect as a *habitus* (ibid.). In contrast, the objective concept is “the thing, which is understood, according to its form or nature, and is conceived through the formal [concept]” (ibid.; col. 711A).

With respect to the concept of being, then, the question of its unity is at issue since distinguishing it from an absolute unity that is proper to univocity is critical for Fonseca’s ability to sustain the concept of being’s analogical character. Again, in contrast to Suárez, Fonseca admits that the unity of the concept of being is less than absolute but more general than the distinct

rationes that constitute the proper concepts of various kinds of being. To explain his claim, Fonseca marks a threefold distinction within the formal and objective concepts, viz., an entirely distinct concept, an entirely confused concept, and a concept that is partly distinct and partly confused (ibid., IV, c. 2, q. 2, s. 3; col. 714D, 715B). A distinct concept is one that determinately and expressly represents all beings in their distinctness, but such a concept is unavailable to us, Fonseca notes, and is proper only to God’s own understanding of all things (ibid.; col. 714E). A confused concept, the Jesuit continues, is, as its name suggests, one wherein all things are represented by means of a concept that is entirely indistinct and most imperfect (ibid.; col. 714F). And, finally, there is that concept that represents one thing or a certain aspect of a thing expressly and determinately and another thing or aspect only implicitly and indeterminately, such, for example, are the concepts representing the highest genus, substance, in which a substance is expressly represented, but quantity and other accidents inhering in it are only implicitly and indeterminately represented (ibid.; col. 715A).

With these distinctions in place, Fonseca explains that any concept can be called one in a twofold matter, either according to the thing or according to reason (*aut re, aut ratione*) (ibid.; col. 715C). Furthermore, there is a twofold manner in which any concept is said to prescind from others: in terms of the “thing itself” and according “to reason” (*a re et a ratione*). A concept prescinds *a re* if the thing itself is distinct from the prescinded things (ibid.; col. 715D). A concept prescinds *a ratione* if in its character (*ratio*) nothing of those things – that are properly conceivable – from which it prescinds is included (ibid.; col. 715E-F). For example, the concept of “human” prescinds from, but does not explicitly exclude, the conceivable elements (e.g., short or tall) that pertain to particular humans. With respect to the objective concept of being, then, Fonseca argues that it is not one in *re*, nor does it prescind from “all the members [i.e., *inferiora*] that divide the objective [concept]” (ibid., IV, c. 2, q. 2, s. 4; col. 716B). Nor, adds the Jesuit, is the “objective concept one in reason [*in ratione*]

except qualifiedly [*secundum quid*]” (ibid.; col. 716C), for which claim he gives the reason that, where the objective concept is one *simpliciter*, it would be univocal (ibid.). Thus, Fonseca concludes that “the objective concept of being does not rationally prescind from all the objective members that divide it except *secundum quid*,” in which its fundamental analogical unity consists (ibid., col. 716F).

The remaining questions addressed in the second chapter of book four pertain to the proper attributes of being (q. 3), the thorny matter of the relation (or distinction) between essence and existence (q. 4), and Fonseca’s transcendental theory wherein he discusses unity (q. 5), truth (q. 6), and goodness (q. 7).

Abstract

During the Renaissance, the growing importance of mechanics stressed previously noticed tensions in natural philosophy when dealing with some specific cases of motion – the motion of projectiles and the free fall of bodies – peripheral in Aristotle’s texts but moving into the spotlight by the fourteenth and fifteenth centuries. Later, by the sixteenth and early seventeenth centuries, mechanics was in a sturdy position to question the assumptions of natural philosophy in the explanation of these two specific motions. But these assumptions also constituted the foundation of other explanations. As a consequence, criticisms initially aiming to replace the notions involved in the account of these phenomena finally targeted the main principles underlying natural philosophies, particularly those rooted in Aristotle. One of the major changes issuing from this was the proper conception both of change in terms of motion – by contrast with the Aristotelian idea of motion in terms of change – and its causes. In order to explain how motion was originated and preserved in bodies, a variety of conceptions of force were introduced, relying

on traditions flourishing during the Renaissance. However, the emergence of the mechanical philosophy by the early seventeenth century, in which motion was conceived by contact action, explicitly aimed to replace explanations in terms of occult qualities and forces. In this context, Galileo, Kepler, and Descartes, among others, struggled with a redefinition of motion and its causes, developing new mathematical techniques and applying them to the study of natural phenomena. In this way, they generated substantive transformations in natural philosophy, finally leading to the formulation of Newton's laws of motion, which established the classical conceptions of motion and rest appealing to forces, substantially modifying the mechanical philosophy.

Heritage and Rupture with the Tradition

Ancient and Medieval Background

The roots of the transformations that ended in the establishment of the cornerstone of classical mechanics – Newton's second law of motion – can be traced back to Aristotle's (384–322 BC) distinction between natural and forced motions (Westfall 1971). This division emerges in the context of Aristotle's *sublunar* world (below the moon, with the Earth at the center), where generation and corruption dominate natural change; this is opposed to the *superlunar* (above the moon) world, where there is no change but perfection and permanence. In the *superlunar* world, celestial bodies are made of eternal and unchangeable aether or quintessence; their motion (if any) is circular, identical to itself, and perpetual. In the sublunary world, by contrast, bodies are composed of the four elements: fire, air, water, and earth. Every element has a natural tendency to move toward a specific place in the cosmos: water and earth tend to fall to the center (because of this, the Earth is made of land and oceans usually remaining steady in the center of the cosmos), while fire and air rise up away from it. In *On Generation and Corruption*, Aristotle explains that bodies can also be moved from side to side, against their natural tendency, in a forced or

violent motion, for example, a piece of furniture pushed across the floor. In Aristotle's view, the natural tendency pulls the piece to the center – or kept it at rest, if it was already there – but the intervention of a mover pressing the body constantly led it to a different place. In consequence, the forced motion requires the constant action of a mover, pushing the body in an unnatural direction. When the action of the mover ceases, the body tends to its natural place or, as in the case of the furniture moved across the floor that is already on its natural place, it only rests. If we lift a stone, that is, if we move it away from the center, it would still keep its tendency to go back to its place, as it can be easily appreciated once it is dropped.

Within this framework, Aristotle explains a wide variety of phenomena, including the motion of projectiles and the free fall of bodies. The motion of projectiles apparently breaks the principle stating that forced or violent motions require the constant action of the mover, for once the projectile is thrown away it is no longer in contact with the mover and yet remains in motion until it finally falls down. In *Physics*, Aristotle outlines two rather vague explanations: (1) the air accomplishes the function of keeping the body in motion, acting as a mover, because it is displaced backward by the initial motion of the projectile, but when it reaches the back of the body, it moves forward and pushes the body together with it, creating in this way some kind of temporary system of replenishment of motion. Air was rushing in to fill the vacuum that otherwise would have been left at the back of the moving object, because “nature abhors vacuum.” This explanation, widely known as the *antiperistasis* (meaning “against standing around”) spread during the medieval times. (2) The air is not only moved by the original mover but it also receives the power to act as a mover; then, by this power it moves the air next to it and the projectile; the air next to the projectile is moved, but it also receives some capacity to move; in consequence, the projectile is successively pushed in the direction originally intended by the original mover (Barbour 2001; Clagett 1959; Sorabji 1988). Regarding the observed acceleration of falling bodies, Aristotle's views are far from being clear. In *On the Heavens*,

he suggests that the acceleration of bodies depends upon their proximity to their natural places: once bodies are approaching their natural places, they move faster. However, when dealing with infinite locomotion, he seems to imply that the speed of fall rather varies with weight. Aristotle's views circulated widely and were developed by early commentators, who further developed these views and added elements coming from others sources such as Neoplatonism.

Problems associated with these explanations were noticed early, although these phenomena are not central to Aristotle's works. The Alexandrian commentator of Aristotle's works, John Philoponus (c. 490–570), remarked in his commentary on the *Physics* that these explanations assign three different, incompatible functions to the air: it must be pushed forward by the projectile, then move back, and finally turn and proceed forward again. In Philoponus' view, an incorporeal kinetic force impressed in the body, not in the medium, better explains the motion of projectiles. By this force, the projectile continues the movement until the resistance of the weight of the body and the air exhaust it. Notice that this kinetic force is a transitory condition, not a property of the body. Philoponus also observed that Aristotle's explanation of free fall seems erroneous according to experience: if you let fall from the same height two weights of which one is many times heavier than the other, you will see that the ratio of the times required for the motion does not depend on the ratio of the weights, but that the difference in time is a very small one (Clagett 1959). Philoponus' criticism on Aristotle seems influential during medieval times. In fact, Avicenna's (c. 980–1037) theory of *mail* (inclination) relies to a large extent on Philoponus' views. In Avicenna's account of the motion of projectiles, the body receives what he calls an inclination from the mover. The action of the inclination differs according to the weight of the body. This inclination is that which is perceived as resisting immobility. However, in Avicenna's view, this inclination is not a force but the vehicle of it, even if it is a permanent capability of the body – such as the capability of getting heat. On the other hand, Avicenna remarks that if there were no

resistance to the inclination, it would last indefinitely and that would apply to the motion that it generates. That would be the case of a body moving in the void; but since there does not appear in nature any case of infinite locomotion, as noted by Aristotle, a void does not exist. A major qualification of Avicenna's theory was made by his disciple Abū'l-Barakāt (c. 1080–1665). According to Avicenna, only a single inclination could reside in a body at one time. In the motion of the projectile, the inclination of gravity would tend to act only when the inclination of the propelling force would be extinguished. By contrast, Abū'l-Barakāt considers that contrary inclinations can reside in a body. In his view, there is a natural inclination that can be opposed by a temporary inclination. In the case of the projectiles, as long as the body is moving upwards is dominated by the temporary, projecting inclination and the natural one only functions as a resistance; but as the temporary inclination dissipates, the natural inclination dominates, and the body starts to move downward: the temporary inclination acts now as resistance.

As interesting as these views appear, late medieval, influential authors held Aristotelian principles as standards to judge these theories. Roger Bacon (c. 1219/1220–1292) criticized the idea of an influence of the projector in the projectile, because there would be no substantial contact to keep the motion of the projectile. Thomas Aquinas (1225–1274) rejected this idea of impressed force by pointing out that putting some source of motion in the body, as an inclination, would violate the very idea of violent motion. From a different perspective, William of Ockham (1287–1347) who considered that motion is not a separate entity of bodies but a mode of relationship considered that projectile motion does not require a continuing cause and, in consequence, rejected these theories of inclination or forces.

Innovative and Original Aspects

By the fourteenth century, the divergent analysis of the motion of projectiles and the free fall of

bodies started to make untenable not only Aristotle and Aristotelians' explanations but also the very categories on which these explanations relied: the conception of motion and its causes. The tendencies dominating the landscape were (1) Francis of Marcia's (c. 1290–1344) theory of *virtus derelicta* ("force left behind"), in which the original mover leaves behind a force in the projectile, which is the principle continuing motion. This force, however, is not permanent but temporary, such as heat is temporary in the body. By this theory, Francis of Marcia also explained the motion of the heavens, claiming that the widely spread idea that celestial bodies were moved by the action of intelligences was, in fact, a proof that these intelligences left behind a force in the celestial objects. (2) Nominalist views associated with Ockham's analysis of motion rejected the Aristotelian opinion on the continuity of motion by the medium. The terminological analysis of Ockham and his followers led to the idea that motion is only a way to name the body in different positions, not a separate entity. (3) Jean Buridan's (c. 1295–1363) theory of impetus offers the first articulated explanation both of projectile motion and free fall by postulating an impressed force causing motion. This impetus is a permanent property of the body. His followers, including Nicolas Oresme, Albert of Saxony, and Marsilius of Inghen, developed variant theories, especially discussing the permanent or temporary character of the impetus, influenced by previous theories.

Buridan's theory of impetus explained motion by appealing to some property of the body, by clear contrast with Aristotle, who appealed to the action of the medium, and with Philoponus, Avicenna, or Marcia, who postulated a vanishing property. Buridan not only articulated the idea of motion as caused by force but also provided a quantification of this. In his view, the impetus imparted by the projector to the projectile varies, on the one hand, as the velocity of the projector, and as the quantity of the body in a moment, on the other – a characterization close to the classical conception of momentum. Furthermore, the impetus was taken as a permanent quality, not self-expanding, and the resistance of the air and the contrary inclination of the body must overcome it;

otherwise it would last indefinitely. The permanent character of impetus clearly contradicted the previous views according to which the *virtus* keeping the body in motion vanished or was exhausted. The acceleration of bodies in free fall of bodies is explained as well by the continual impression of impetus and by gravity (*gravitas*, understood not as a force but as tendency to move downward). Finally, the permanent character of impetus led Buridan to claim that God impressed some impetus to the heavens at the creation of the world, explaining in this way their motion. It is important to highlight, as a corollary, that Buridan's concept of impetus did not make any distinction between rectilinear and circular motion – a central distinction in subsequent dynamics (Gabbey 1971; Hall 1969).

Buridan's theory of impetus opened up new possibilities to consider motion as caused by a force related to some internal, permanent property of bodies. But Buridan's departure from the crumbling Aristotelian establishment is just an infinitesimal part of a larger trend, emerging with more strength during the following centuries. In fact, a growing dissatisfaction with Aristotle, Ptolemy, Galen, and their medieval followers led Renaissance and early modern thinkers to look for alternatives to fully replace these traditionally accepted views and then severely questioned. One of the main sources offering alternatives to replace these traditional explanations of natural phenomena came from the magical views boosted by the Renaissance discovery of Hermes Trismegistus and other presumed ancient magical texts, backing up explanations based on the influence of stars on terrestrial events, sympathies and antipathies, and forces of attraction and repulsion. All these explanations were clearly at odds with the Aristotelian and Medieval accepted views and, because of this, became highly influential in providing alternatives. Marsilio Ficino (1433–1499) offered the starting point of a highly influential trend of Neoplatonist views based on occultism that can be followed, for example, in the works of Jean Fernel (1497–1558) and Girolamo Fracastoro (1476–1553). Fernel pursued explanations based on the influence of the stars, while Fracastoro relied on the idea of sympathies.

Others considered light as responsible for animating nature, capable of acting on bodies, generating motion and transformations. What is at stake in the occult qualities traditions is the possibility to provide explanations based on unknown qualities – such as forces, sympathies, or mutual influences – which are still natural (Henry 1986). In other words, these qualities are not directly known but occult; nevertheless, their ways of operating can be uncovered by experience. The idea of a force internal, transmitted or acting to generate motion, is at odds with Aristotelian explanations and takes hold in the magical traditions, as part of the attempts to replace unsatisfactory explanations, as those of the motion of projectiles and the free fall of bodies detected as problematic since the Middle Ages.

Meanwhile, the mechanical philosophy emerging during the early seventeenth century was critical both of Aristotelian philosophy and of explanations based on occult qualities. Mechanical philosophers attempted to explain *all* phenomena by appealing only to matter in motion. As a consequence, occult qualities were described as unintelligible phantasies. Galileo's (1564–1642) approach to natural philosophy makes a powerful use of mathematics to reveal truths about the physical world (Valleriani 2010). However, his natural philosophy is shaped by a kinematic approach, including only bodies in motion and avoiding in this way all discussion on the nature of force (Jammer 1957). His explanation of the free fall of bodies – his most remarkable achievement – conceived motion as “naturally accelerated” as different from and nondependent upon the weight of the body. In a similar way, the uniform motion of terrestrial objects around the center of the earth was natural as well. As a consequence, Galileo conceived a circular inertia, that is, a natural tendency of bodies to describe circular motions, providing in his view a physical explanation of the Copernican astronomy. Another example can be appreciated in his theory of tides, which completely relied on the motion of the Earth as generating the flux and reflux of the sea. Galileo criticized Kepler's theory of the tides, based on the attractive force of the moon as mere “puerility” (Henry 2011a).

Kepler (1571–1630), in fact, attributed to the Sun an attractive force acting at a distance on the planets. In his view, the motion of the Earth could be explained in terms of an efficient cause flowing out from the Sun. In the *Mysterium Cosmographicum* (1596), Kepler explains this phenomenon in terms of a solar soul extending throughout space; later, in *Astronomia Nova* (1609), he moved to an explanation in terms of a motive force. Sometimes he also appealed to William Gilbert's (1544–1603) magnetic philosophy, to portray planets as magnets driven by the magnetic force of the sun. These characterizations are connected to his mathematical findings. As a matter of fact, Kepler's mathematical discoveries of the elliptical shape of the planetary orbits and the variable speed in the motion of the planet when approaching the Sun convinced him that this had some kind of attractive power or virtue to perform these actions.

In the meantime, Descartes (1596–1650) projected a full system of philosophy to replace the Aristotelian, following the ideas of certainty and clarity, inspired by geometrical approaches. Because of this, Descartes openly rejected occult qualities and, in consequence, any meaningful idea of force. In its place, he depicted the universe as completely full of a pure geometrical matter, set in motion by God in the creation. All motion is caused by the collision of particles, and, because God is immutable, the total amount of motion remains always the same. However, instead of forces or qualities, bodies have tendencies to move according to their geometrical nature, which Descartes described in his laws of motion, avoiding all reference to force (Hatfield 1979). This being so, Descartes conceives that circular motion is, in fact, a detour of the natural tendency of particles to move in straight paths, generated by the constant impact in a universe full of matter. Descartes' philosophy was highly regarded and inspired critical followers such as Huygens (1629–1695) and Leibniz (1646–1717).

Impact and Legacy

The concept of force finally made its way to classical mechanics through the work of Isaac

Newton (1642–1727). Newton’s approach is also critical of Aristotelian philosophy, but his main target is the Cartesian universe. In his view, a world full of matter, in which all phenomena occurred by impact, was not enough to explain what we can gather from experience and particularly the empirical regularities of planetary motion devised by Kepler and codified as laws. In his *Mathematical Principles of Natural Philosophy* (1687), Newton demonstrated that terrestrial and celestial phenomena could be explained by the same set of concepts and laws – demolishing what was still standing of the Aristotelian distinction between the *sublunar* and the *superlunar* worlds. At the very center of this new conceptual edifice, Newton placed the force of gravity, whose action is universal (De Gandt 2014). As a matter of fact, by conceiving terrestrial gravity as the same attraction retaining the planets in their orbits, Newton was able to differentiate the weight of bodies, which is a function of their distance to the center of the earth, from their mass or “quantity of matter,” that is, a property of the body independent of their position. Once this distinction is done, it is possible to conceive the quantity of motion of the body or momentum and of force, as determined by the ratio of change of momentum. This new conceptual structure includes a variety of forces: (1) the force of inertia or the capacity of the body to resist motion or to persevere, in its state of rest or rectilinear, uniform motion. Newton usually calls this force “innate” and, in his view, is a passive force or a force of resistance, proportional to the quantity of matter; (2) impressed forces or forces in which an action is exerted upon a body in order to change its state, for example, percussion or pressure; finally, (3) centripetal force, which draws or impels the body toward a point as to a center. From these definitions, Newton was able to conceive the motion of the celestial bodies as a balance of forces (inertial and centripetal) and the acceleration of motion as a function of the force of gravity between the Earth and the terrestrial bodies. Newton thought the motion of the particles composing matter should also be explained in terms of forces, attractive and repulsive. In the famous “Questions” of his *Opticks*, Newton offered extensive experimental support to these claims.

Newton was able to provide a mathematical definition of the kind of force he dealt with in his *Principles*, as variables depending upon the change of momentum. These forces could explain a wide variety of motions mathematically. Newton definition of force in his *Principles* is a mathematical one, useful to explain physical phenomena, but this does not amount to a definition. By contrast, he claims that he has been able to offer a mathematical law explaining the action of gravity and to deduce from this a wide variety of celestial and terrestrial phenomena, but that he ignores its cause. In so doing, Newton inscribes his conception of the force of gravity as action at a distance in the experimental tradition of occult qualities and, at the same time, provides a new way to apply mathematics in the study of natural phenomena (Henry 2011b). In so doing, Newton resumes traditions going back to the Renaissance, whose conclusions, however, constituted the starting point of the Enlightenment.

Foreknowledge in Renaissance Philosophy: Divine

Antonio Gerace

Research Unit of History of Church and Theology, KU Leuven, Leuven, Belgium
Fondazione per le scienze religiose “Giovanni XXIII”, Bologna, Italy

Abstract

This entry deals with the notion of God's foreknowledge. First, Augustine's position is delineated, after which follows that of Boethius, in order to introduce the theological and philosophical topics which characterized the later discussion on divine foreknowledge. Then, the focus will turn to Aquinas' view. Augustine, Boethius, and Aquinas furnish the arguments necessary to comprehend the discussion of the early modern era, characterized by both the Catholic–Protestant debate and

the inner-Catholic debate between Molinist and Augustinian-minded theologians. Therefore, attention will be paid to Calvin, while the last section will focus on Molina, who followed (and improved) Aquinas' terminology in order to better rebut Reform-minded theologians, although his theses were harshly criticized by anti-Pelagian Catholics.

Augustine

By means of his foreknowledge, God knows all future contingents. Such knowledge is *fore*, since God knows the future events *before* the creation of the world. The problem is therefore the relation between God's foreknowledge and the possibility of human free will. In brief, if God knows all future events, and therefore each person's acts, how could men be free? For instance, in his *Predestination of the Saints*, Augustine (Thagast, 354 – Hippo, 430) affirms simply that God foreknows what he will create, but he also foreknows those things that do not depend on his will, such as sins: he of course foreknows them, given his omniscience, but he could not predestine them otherwise this would have the absurd consequence that God is the cause of men's sins. Augustine therefore affirms on the one hand that God's foreknowledge is necessary, namely that what God foreknows will happen in any case, but such necessity in no way determines or influences men's acts. More specifically, according to Augustine it is not technically correct to speak about “God's foreknowledge,” as Augustine explains to Simplician, since the temporal difference between past, present, and future does not pertain to God. Everything is present to him in his timeless condition. Therefore, God has knowledge (*scientia*) of what is considered future by men (Augustine 1970: II.2).

Severinus Boethius

In his *Consolation of philosophy*, Severinus Boethius (Rome c. 475 – Pavia, 525) also considered eternity to belong to God's condition; therefore, he thought of God's knowledge as able

to grasp all events which occur in time in the never-failing instant which characterizes the a-temporal dimension of eternity (Craig 1988: 96). The problem was again the correlation between God's knowledge and human free will, since God's eternal view on his creation may be thought to determine men's acts. Boethius' solution was the distinction between two kinds of necessity: *simple necessity*, according to which necessity is due to the essential attributes of a being, as for instance, the necessity that men are mortal, since it is in man's nature to be mortal. Opposed to this is *conditional necessity*, according to which something is necessary only when it happens, as for instance, the necessity that I write in the moment in which I'm effectively writing. Boethius applies this difference between *simple* and *conditional* necessity to God's knowledge, in its timeless present: "His knowledge imposes no absolute necessity on the things He knows, but only a conditional necessity: *if* He knows them, then they must exist – but there is no necessity that He knows them. Therefore, events which for us lie in the future are known by God as present and as occurring contingently, insofar as they are product of our free decision" (Craig 1988: 98).

Thomas Aquinas

Thomas Aquinas (1225 Roccasecca – 1274 Fossanova) dealt with the problem of God's knowledge by distinguishing between two sets: (1) The knowledge of vision, by means of which God knows those things that occurred, or occur or will occur, so that they not only were, are, or will be in potency but they have also been, are, or will be actualized. (2) The "knowledge of simple intelligence," by means of which God knows those potencies that do not exist in any time (Aquinas 2000: d, 39, q. 1 art. 2). Of course, Aquinas also thought God's eternity as a timeless dimension. Therefore God, by means of his knowledge of vision, knows the entire succession of events which occur in time. According to Aquinas, God's knowledge is necessary and infallible, but it does not determine human acts, since

the knowledge of vision which God has in his timeless eternity is not prior to the events that occur in time. Rather, God's act of knowledge and the event in time happen simultaneously. In particular, in *Summa contra Gentiles*, he maintains that any part of time, past, present, and future, is in God's intellect "somehow present." In the *De veritate*, he clarifies that what men know as past, present, and future in time, God knows timelessly; what men consider as future, in God's vision is present, since God is "extra" time. Furthermore, Aquinas thought a "knowledge of approval," by means of which God chooses which potency will be actualized (Craig 1988: 124), between the knowledge of all possibilities by means of his simple intelligence and the knowledge of the actual things by means of knowledge of vision. That voluntary act of the knowledge of approval necessarily determines which potency will be actualized. However, the events are consequently and not (onto-)logically necessitated: the necessity of a particular event is not given by its essence, but by the cause–effect relation. In Aquinas' view, this explanation is sufficient to save human free will.

John Calvin

Among Reform-minded theologians, John Calvin (1509 Noyon – 1564 Geneve) was perhaps the one who focused most upon the concept of foreknowledge. At least, he developed the concept of predestination, strictly related to foreknowledge. In particular, Calvin, in his *Institutes of the Christian Religion*, maintains that "when we attribute foreknowledge to God, we mean that all things have always been and eternally remain under his observation, so that nothing is either future or past to his knowledge: he sees and regards them in the truth, as though they were before his face. We say that this foreknowledge extends throughout the circuit of the world and over all his creatures. We call predestination the eternal decree of God by which he decided what he would do with each man. For he does not create them all in like condition, but ordains some to eternal life, the others to eternal

damnation” (Calvin 1962: III.21.5). Concerning the terminology used, Calvin’s definition of foreknowledge does not diverge from that of Augustine. The Reformed theologian reflects Augustine’s theory, as presented in the *Predestination of the saints*, in which the Church father explicitly affirms that God foreknows his creation and predestined before creation those people who will receive grace by means of vocation, choosing them on the basis of his own purposes, not for their merits (Augustine 1962: 570).

Luis de Molina

In the sixteenth century, the problem of God’s foreknowledge was further analyzed by the Spanish Jesuit Luis de Molina (Cuenca, 1535 – Madrid 1600), who developed a new model of God’s knowledge, close to that of John Scotus, although using a terminology similar to that of Thomas Aquinas’. Molina’s great innovation lies in his description of God’s pre-volitional “middle knowledge,” which replaces Aquinas volitional “knowledge of approval.” In his *De liberi arbitrii cum gratiae donis, divina praescientia, praedestinatione et reprobatione Concordia* (On the Concord of Free Will with Grace’s Gifts, Divine Foreknowledge, Predestination and Reprobation), the Spanish Jesuit affirmed that God, anterior to creation, has three different orders of knowledge, differentiated logically, rather than chronologically. Anterior to any voluntary act, God has “natural knowledge,” by means of which He knows any potency; “middle knowledge,” by means of which He knows only those potencies that would be actualized; and finally “free knowledge,” by means of which He knows those potencies that will be actualized after the intervention of his will. In this scheme, human free will is conserved thanks to “middle knowledge,” since by means of it God has certain foreknowledge of those events that would occur in the future, even though their existence is not necessary. Indeed, middle knowledge is pre-volitional, since it intervenes prior to any act of God’s will, in the sense that He knows a particular event even though He has not (yet) decided whether He will create it or

not or, more accurately, whether He will actualize it (Molina 1988). Concerning human acts, God knows “what each created free agent would do in any situation in which that agent might be placed” (Gaskin 1993: 412–413). However, the agent maintains the logical possibility of acting differently from what God has foreknown, because God has not yet created that particular order of things. Molina could develop this threefold conception of God’s knowledge because he considered eternity, not in the way that Augustine and Boethius had, namely as a timeless presence, but Molina, conceived eternity not as containing the future if considered as the entire extension of the time. Any event exists only when it occurs in time; therefore, a contingent event retains the possibility of not being in the future although God could have foreseen it in his eternal dimension.

Formula Concordiae

Federico Barbierato

University of Verona, Verona, Italy

Abstract

Elaborated in 1577 to resolve the theological disputes within the Lutheran movement, the *Formula Concordiae* is the result of the joint work of a group of theologians gathered first in Torgau from April to June 1576 and then – in a reduced composition – in Bergen Abbey between March and May 1577. After the Augsburg Interim of 1548, substantial doctrinal and liturgical aspects had cracked the Lutheran front, and issues such as those of good works, free will, or the rule of law in Christian life were at the center of the debate. At the same time, elements of dispute with other Reformed denominations – such as the one between Luther and Zwingli about the presence of the blood and body of Christ in the Eucharist – had led to harsh confrontations among the disciples of Melancthon. Attempts to resolve disputes had continued – with unsuccessful results – during the 1550s and 1560s. The spirit of the 12 articles of the *Formula Concordiae* was inspired by a reiteration of the Augsburg Confession. Presented to the Elector of Saxony on 28 May 1577, the document was signed by a large number of imperial electors, princes, imperial cities, and pastors. In other words, about two thirds of the Empire Lutherans welcomed the text, which however was rejected by many others. Despite such partial acceptance, the *Book of Concord* is still the official definition on doctrinal matter for the majority of Lutheran Churches.

History and Original Aspects

Elaborated in 1577 to resolve the theological disputes within the Lutheran movement, the Formula

Concordiae is the result of the joint work of a group of theologians gathered first in Torgau from April to June 1576, then – in a reduced composition – in Bergen Abbey between March and May 1577. After the Augsburg Interim of 1548, substantial doctrinal and liturgical aspects had cracked the Lutheran front, and issues such as those of good works, free will, or the rule of law in Christian life were at the center of the debate. At the same time, elements of dispute with the other Reformed denominations – such as the one between Luther and Zwingli about the presence of the blood and body of Christ in the Eucharist – had led to harsh confrontations among the disciples of Melancthon. Attempts to resolve disputes had continued – with unsuccessful results – during the 1550s and 1560s. The group of theologians who met in Torgau, among whom featured Jacob Andreae, Martin Chemnitz, and David Chytraeus, could rely on some texts already formulated in the past: firstly the Swabian-Saxon Concord, drafted in 1574 by Andreae, subsequently the *Maulbronn Formula* produced in that same 1576. The outcome of this first phase of work was a provisional text (the *Torgau Book*), condensed by Andreae in a new text that would become known as the *Epitome*, that is, the first part of the *Formula Concordiae*. The *Torgau Book* circulated among German ministeria in 1576. Criticisms were incorporated by Andreae, Chemnitz, and the smaller group of theologians who met in Bergen. The final product was the *Bergic Book* (or the *Solid Declaration*).

The spirit of the 12 articles of the *Formula Concordiae* was inspired by a reiteration of the Augsburg Confession. In contrast with the opinion expressed by Matthias Flacius Illyricus, the original sin was not considered “essential” but rather as a corruption of the spiritual powers of the sinners, which brought them to a separation from God (Art. 1). Once fallen, the sinner could only rely on the Holy Spirit, according to the idea that the will had a “passive capacity” to be moved toward faith (Art. 2). Human merits did not affect the will of God, whose word could create a new reality in the new creature by virtue of the obedience demonstrated by the Son to the Father, up to the sacrifice on the cross (Art. 3). Good works therefore were not necessary for

salvation, though they were so for Christian life (Art. 4). The latter had to be guided by God's Law, whose relations with the Gospel of Jesus Christ were defined in contrast to antinomian positions. According to the *Formula*, the Law not only served to order society and punish sinners but, reinforced by the "pure grace" of the evangelical truth of forgiveness and justice, could bring the faithful to desire to please God (Art. 5). The Law therefore would be a guide for the regenerated man to take the right decisions, enlightened by the Gospel (Art. 6). The formula brought to an end, in Article 7, the controversy about the real presence of the body and blood of Christ in the Eucharist, capable of giving strength to believers, especially the more feeble. Article 8, instead, focused on the unity of the human and divine nature of Christ, indirectly proven in Article 9 by the affirmation of Christ's descent into hell: "we believe simply that the entire person, God and human being, descended to hell after his burial, conquered the devil, destroyed the power of hell, and took from the devil all his power." The issue of *adiaphora* – religious practices deemed indifferent to the faith because neither prescribed nor prohibited – was addressed in Article 10, in which emphasis was put on the need for a clear confession of faith, and on the fact that the faithful should not yield even on insignificant matters, if they were forced by "enemies of the word of God." Article 11 recalls the Lutheran doctrine of predestination, asserting God's unconditional choice of who is to be saved, and human responsibility for the rejection of God and faith. Knowledge of one's fate will be known only through Grace. Article 12 closes the *Formula* with a clear rejection of Anabaptist, spiritualist, and anti-Trinitarian doctrines.

Presented to the Elector of Saxony on 28 May 1577, the document was signed by a large number of imperial electors, princes, imperial cities, and pastors. In other words, about two thirds of the Empire Lutherans welcomed the text, which however was rejected by many others. Despite such partial acceptance, the *Book of Concord* is still the official definition on doctrinal matter for the majority of Lutheran Churches.

Fortune in Renaissance Philosophy

Timothy Kircher

Guilford College, Greensboro, NC, USA

Abstract

Renaissance thinking on fortune is complex and expressed as often in symbol as through concepts. Drawing on a range of classical, Patristic, and medieval sources, writers articulated fortune both more abstractly in terms of its place in a metaphysical ontological

hierarchy and more concretely with respect to the immediate conditions of life that tested one's virtue. For each of these viewpoints, fortune connoted favorable or adverse circumstance as well as mutability and temporality. In the course of the Renaissance, thinkers focused more intensely on how virtues and moral freedom were secured by reason against fortune's sway. Toward the close of the period, this focus shifted to the nonrational and amoral qualities required to contest fortune's influence.

Synonyms

Chance; Fate; Luck

Introduction

The theme of fortune in human affairs holds a special place in philosophizing, because it is a constant enigma. Whether treated in Calvin's thoughts on predestination, Kant's pondering over the forces of nature versus nurture, or contemporary medical inquiries into whether genetics determine our destiny, fortune is a steady topic of reflection. It addresses the range and limits of human freedom; it elicits the feeling of powerlessness. Toward the close of the Renaissance, Shakespeare's Cassius speaks of the fault lying not in the stars but in ourselves, still, on another occasion, Hamlet senses a "divinity that shapes our ends, / Rough-hew them how we will" (V.ii.10–11). Fortune's riddle is insoluble, provoking schemes to make sense out of accidents and to build a frame that contains transience. His Helena, inspired by Boccaccio's Giletta, expresses the challenge for the early seventeenth century with balanced cadence:

Our remedies oft in ourselves do lie,
Which we ascribe to heaven. The fated sky
Gives us free scope, only doth backward pull
Our slow designs when we ourselves are dull.
(*All's Well that Ends Well*, I.ii.216–219)

Since fortune escapes our conceptual grasp, Renaissance writers and artists made of it a metaphor. *Fortuna* is for Petrarch's poetry the storm

the poet faces on the sea of life (*Canz.* 272.12). Fortune, like the Greek Lachesis or Roman Fortuna, remained feminine and could embody both the virtues and frailties commonly assigned to women. She became the fertile subject for numerous artists. She is melded with the virgin in Olivuccio di Ciccarello's International Gothic altarpiece of the early 1400s, balancing on her crescent moon. In Pinturicchio's moral mosaic of the Sienese cathedral from 1504, she is a towering nude deity, carrying a billowing sail, with one foot on a sphere and the other in a ship with broken mast.

As the two examples show, Renaissance fortune wears different faces. It ranges in figuration. What is of interest for Renaissance philosophy is the way writers and thinkers made sense of the riddle it presents. It was one they inherited, but their treatment is innovative. In no way should we expect, in their reactions to this existential and moral quandary, a consistent response or one that followed a uniform development. Considering that dialogue was a favorite form of Renaissance exposition, a writer could express the instability of his or her own viewpoint through an exchange among interlocutors, for example, in Poggio Bracciolini's *De varietate fortunae* of the late 1440s. Nonetheless even with the fluctuations of their responses, we can chart the flow of the tide.

Renaissance thinkers confronted the theme of fortune with a double vision. The first view was rooted in medieval metaphysical ontology. It held fortune to be under the sway of providence, divine foreknowledge, or, as in Olivuccio's painting, heavenly mercy. It offered the bereft or confused the security of divine guidance and care as the anchor of the chain of being. But it also, especially in the wake of catastrophe, raised questions about the transparency of God's goodness or the authority of his clerical representatives. The other view looked apart from this ontological foundation and focused more on the immediate, sensible conditions and circumstances. Here Renaissance writers were concerned not only with the arbitrariness of fortune, in its own agency, but also with the strength or weakness of human virtue and volition in taking arms against it. They focused

on fortune's influence on the emotions, which could disturb virtuous tranquility. If the first view held fast to a metaphysical grounding in God as the source of being, the second conception aimed at securing the safety or happiness of one's lot through the imagined clarity of reason or firmness of virtue. This second conception grew in scope during the fifteenth century, gradually obscuring, but never eclipsing the first. In the end, however, even this rational clarity became darkened and virtuous stolidity more labile.

Each of these visions of fortune embraced in varying measure two different qualities of fortune itself. Fortune was encountered, first of all, as the set of accidents or circumstances that one traversed on life's path. These could be positive or negative, for example, wealth or poverty, beauty or ugliness, and status high or low and so were often conceived as contraries. The second quality of fortune took root in the first, circumstantial one: it emphasized its vacillation and capriciousness. Circumstances were unstable, a spinning globe or stormy ocean, and here thinkers concentrated, with increasing measure, not simply on change but on the incessant, existential process of change. Novelty entailed transience in the sense not only that accidental goods or perils were fleeting but also that a person's life was always in motion as well. Both external circumstance and inner character were in flux, and the individual was set out into life at an involuntary, indeed fortuitous moment, unable to choose the conditions into which he or she was born. This second quality of fortune emphasizing temporality, mutability, and history, along with the perspective of rational and virtuous contest, became more pronounced in the course of the Renaissance, without ever forgetting fortune's quality of accident or circumstance: this quality was in fact seen in a new light.

Heritage and Rupture with the Tradition: Innovative and Original Aspects

The classical and medieval sources of these two views, both the more abstract and the more earthly, have been discussed by the foundational studies of Doren (1924), Patch (1927), Courcelle

(1967), and Cioffari (1973). The study of providence and divine foreknowledge governing fortune developed throughout the Middle Ages from the writings of Augustine (*De civitate dei*), Boethius (*De consolazione philosophiae*), Thomas Aquinas (*Summa contra gentiles*), and also from readings of Aristotle's *Physics* and *Metaphysics*. It received its most poetic syntheses in the Dante's *Inferno* 7 and in the closing speech of Theseus in Chaucer's "Knight's Tale," which was based on Boccaccio's *Teseida*. The focus on fortune's more mundane and emotional effects derived from Cicero (*Tusculanae*, *De officiis*) and especially Seneca (*Epistulae morales* and presumably *De remediis fortuitorum*). This variety of sources, with their range of viewpoints, allowed Renaissance writers to ground their own conceptions on different bases and perspectives; the rediscovery of Lucretius's *De rerum natura* in the fifteenth century, through its atomizing agnosticism, provided them with yet another provocative authority. Regardless of the sources, writers retained throughout the Renaissance an important legacy of this tradition: that fortune played a crucial role in the investigation of moral freedom.

The Renaissance rupture with this tradition, whereby thinkers and poets expressed their innovations, can be grasped by noting a number of their assessments in chronological sequence, with respect to each of the two viewpoints.

With regard to the first perspective *sub specie aeternitatis*, Petrarch formalizes a vision of the goddess Fortune in *Canz.* 325. She describes to the poet the heavenly design of the birth of his beloved Laura, but this starry messenger also foretells her death before turning from him on her revolving wheel. Boccaccio, in his later writings, suggests Fortune is the equivalent of Lachesis and the instigator of all happenstance (*GDG* 1.5), relying on, among other sources, the authority of Apuleius (*De mundo*) and the more transcendental notion of Boethius. He cites Boethius's view again in his commentary on *Inferno* 7 and refers to Aristotle when asserting the influence of celestial intelligences over earthly affairs (*Esp.* VII.lit. 55–91). His *De casibus virorum illustrium* maintains this subordination, in order to cast down the pride of princes. Coluccio Salutati, friend of

Boccaccio and follower of Petrarch, devoted an entire treatise to fate and fortune. Composed after the death of his wife, *De fato et fortuna* bases its analysis of free will and necessity on authors ranging from Augustine to Scotus. It upholds a balance between heavenly causes and earthly contingencies (Witt 1983). What is striking, apart from their original combinations of sources, are the poetic and rhetorical idioms that convey these writers' observations: the tone is often personal, urgent, and heartfelt. If Salutati claims that the will is fated to be free, Lorenzo Valla's dialogue *De libero arbitrio* delves more deeply into this paradox, rejecting these philosophical reconciliations, especially those of Boethius. God's foreknowledge, his eponymous interlocutor asserts, cannot be comprehended by reason. He records a discourse by Apollo, in which Jupiter and Fortune are the secret arbiters of destinies: Apollo may foresee, but not alter, what is to come.

Valla explodes the conventional treatment of philosophical questions, in a way that Luther would later appreciate. But his analysis did not subdue the need to pursue a metaphysical solution, even if a solution's foundation now seemed less secure. An early letter of Marsilio Ficino, *Della fortuna*, declares human prudence a divine gift. God grants people both good fortune and the moral ability to overcome mischance, so that fortune is subordinate to God (Kristeller 1964). Bartolomeo Scala, like Salutati a Florentine chancellor, treated the theme of fortune in 1496, the year before he died. His *Apologia contra vituperatores civitatis Florentiae* challenges the position, abetted by Lucretius, that fortune holds sway over all creation. While mentioning his sympathies with the opposing view, which proclaims the power of prudence, Scala focuses on the way humanity attributes to fortune what is actually the hidden workings of nature, "who is also God." Fortune, in other words, is a creature of our ignorance (6–8). A late work by Giovanni Pontano, the Neapolitan humanist, reflects anew on human frailty before fortune. Published posthumously in 1512, *De fortuna* shares the melancholy tenor of Machiavelli's 1513 *Il principe* in the wake of the Spanish and French invasions of Italy. In

opposition to Giovanni Pico della Mirandola, who would liberate human agency from astrological influence, Pontano emphasizes the power of the stars. Citing a host of classical and scholastic authorities, he strives to harmonize this power with moral clarity and virtue. Thus in the sixteenth century, the traditional metaphysical hierarchy governing fortune perdures, but these later treatises nonetheless manifest a preoccupation with moral virtues and reason as the prime defense against fortune's contingencies.

This second perspective on fortune, which contends with the way we respond directly to fortune's accidents, receives its most extensive treatment in Petrarch's *De remediis utriusque fortune*. Adapting the psychomachia of Seneca, Petrarch creates a series of dialogues between reason and four contrasting emotions (sorrow, joy, fear, and hope). His *Secretum*, an imaginary discourse between the eponymous Franciscus and the figure of St. Augustine, reinforces this moral, often Stoic exchange, in which the life of reason is upheld as the bulwark *sub imperio fortune* against emotional turmoil (2.14). Around the same time, Boccaccio's *Decameron* recounts various tales, often derived from Alexandrine romances that show the force of fortune or the human ingenuity required to overcome it. The narrators and their stories focus on comedy and tragedy in the sublunary realms, apart from celestial influence (days 2–3). Both Petrarch and Boccaccio underline fortune's temporal impetus. *Sub imperio fortune*, humanity is subject not only to happenstance but also to temporal revolution, aging, and mortality, against which, these works suggest, there is no rational refuge or choice.

Both qualities of fortune, its circumstantial and temporal or historical, are explored almost obsessively by later writers. Leonardo Bruni begins his *Isagogicon moralis disciplinae* by asserting how moral enlightenment prevents us from "wandering about in the dark on what whatever by-way fortune should offer us" (Baron 1928). Matteo Palmieri's *Della vita civile* glosses Bruni's position in the Tuscan vernacular, opposing the "circumstance of fortune," into which each person is born, with the "virtues of the mind," which transcend fortune's influence (1.168–69). Lapo da

Castiglionchio the Younger and Niccolò Perotti reiterate this confidence in reason and virtue's power over fortune when dedicating their translations of Plutarch to Cosimo de' Medici and Nicholas V. Leon Battista Alberti uses the thematic of virtue and fortune in his vernacular dialogues *Della famiglia* and *Theogenius*. His concerns, too, involve the temporal changes fortune brings, whether in one's personal life or in the histories of the Alberti clan and indeed of entire nations. This temporal and historical sensibility finds metaphorical expression in his dinner piece *Fatum et fortuna*; here a philosopher recounts a dream vision in which shades transverse the river of life, singly or in ships, occasionally buoyed by planks (*tabule*) of the liberal arts. Alberti revises the Patristic metaphor of penitence as the salvific plank after shipwreck in the sea of life, relocating this aid from sacramental to humanist sources. But Alberti revises too the conflict between virtue and fortune, since fortune paradoxically provides people with the occasion to embrace liberal studies as the guide in navigating its currents. Fortune is not only momentary accident or circumstance but suggests timing as well as time itself. Poggio's *De varietate fortunae* also speaks of both attributes of fortune; the work describes the "theater" and "game of fortune" that affects all, especially the powerful, in a way that anticipates Erasmus: fortune "cherishes them, using them according to its rule: first casting them down, then unmasking their folly" (*Proem.*). There is a Lucianic caste to Poggio's treatment as he strives to maintain detached, rational objectivity on human foolishness; nonetheless his dialogue opens with a long lament over the ruins of Rome, its history, too, being subject to fortune's sway.

Thus in anticipation of Machiavelli and Guicciardini's meditations on fortune, fifteenth-century writers note another of fortune's qualities: its kinship with *occasio*, in the sense of timing. This kinship becomes an allegorical feature in Aeneas Sylvius Piccolomini's *Somnium de fortuna*. Aeneas likens Fortune to the Roman god of opportunity; the dream vision proclaims the virtue of Alfonso of Naples, who seizes Fortune by the hair and holds her still (Warburg 1999).

This image of seizing fortune, which was part of Alfonso's triumphal procession in Renaissance Naples, resonates in Machiavelli's treatment of fortune in chap. 25 of *Il principe*, where he calls fortune a woman that the bold ruler must beat and bend to his will. Despite this show of misogynist bravado, Machiavelli states that even able rulers can only determine half of their success: they might raise the banks surrounding fortune's river and yet see flooding. In his observations, moral virtue is displaced by *virtù*, strategic acumen and tactical skill. It has the amoral quality earlier found in the *ingegno* of various characters of the *Decameron*. The contest between fortune and *virtù* remains in doubt; Cesare Borgia, whom he praises for political ability, failed either from malignant fortune or lapse of judgment. Like earlier humanists, Machiavelli emphasizes fortunate timing: for example, Julius II's rash personality suited the situations he confronted. Francis Bacon provides a neat formulation of this timing in his essay "On Fortune": for the fortunate, "there be not stonds nor restiveness in a man's nature, but that the wheels of his mind keep way with the wheels of his fortune."

Francesco Guicciardini, Machiavelli's compatriot, agrees with these sentiments while tinging them with greater pessimism. Recalling Petrarch and Alberti's treatments, he claims it requires greater skill to resist prosperous than adverse fortune (C 164). In general, "fortune has the greatest power in human affairs," so that our efforts, if they are to moderate its effects, still require good fortune (C 30). Along these lines he observes that fools often accomplish more than the wise, since they rely more on fortune than on reason; in sum, he never read anything quite so well expressed as the dictum, "Ducunt volentes fata, nolentes trahunt" (C 136, 138).

The turn to folly and fortune finds its place in late-Renaissance rumination. Bacon writes, as if reading both Italian statesmen, "there be not two more fortunate properties, than to have a little of the fool, and not too much of the honest." In Erasmus's inspired *Stultitiae laus*, his voice piece Folly claims that Fortune, as "directrix of human affairs," is hostile to the wise with their cautious prudence, favoring instead bold fools.

Michel de Montaigne, throughout his *Essais*, laconically accepts Fortune's sway: "I have hardly the skill to dodge Fortune and escape or force her, and to direct and lead things foresightedly to serve my purpose" for "I owe much to Fortune in that up to this point she had done nothing hostile to me, at least nothing beyond my endurance. Might it not be her way to leave in peace those who do not trouble her?" (2.17; 3.9).

Impact and Legacy

With Montaigne, Renaissance reflections on fortune have shifted from their traditional astral origins and also from their common moral imperatives. Humanity is seen without either the benevolent guidance of the heavens or the confidence in reason and virtue that resounded in dialogues a century earlier. When considering free will's contest with fortune, writers emphasize its relative impotence or political acumen rather than moral strength. But the diminished moral discussion is compensated through other equally fundamental philosophical inquiries: a renewed assessment of the limits of human agency, not only in terms of what we might do but also with regard to what we might know. Montaigne's *Que sçay-je?* (2.12) sounds a Socratic note already present in earlier Renaissance writings: it draws attention to the personal, historical context in which philosophical assertions are conceived. Fortune may favor or fight us, but she (or it) is always with us; we are not born without her presence. If her legacy is now overlooked – it is ignored, for example, in the *New Dictionary of the History of Ideas* – that, too, Renaissance writers remind us, is part of her legacy. We need only search for her new face, which we may see in our DNA.

Fotherby, Martin

Born: c.1560, Grimsby

Died: 11 March 1620, London

Giovanni Tarantino

School of Historical and Philosophical Studies,
University of Melbourne, Melbourne, VIC,
Australia

Abstract

Bishop of Salisbury from 1618, a former protégé of and chaplain to Archbishop John

Whitgift and also, ironically, the grandfather of the author of the deistic *Treatise of Humane Reason* (1674), Fotherby's intellectual legacy comprised a treatise attacking atheism, published posthumously as *Atheomastix* in 1622, and a collection of four sermons, which appeared in 1608.

Biography

Martin Fotherby (c.1560–1620), Bishop of Salisbury, was born in Grimsby, the second son of Martin Fotherby and his wife, Isabell. After studying at Cambridge and becoming a Fellow of Trinity, he took holy orders and was appointed Archdeacon of Canterbury in 1596 and Dean in 1615. He is regarded as having been a protégé of Elizabeth I's last Archbishop of Canterbury, John Whitgift. In 1592, Fotherby married Margaret, the daughter of John Winter, a prebendary of Canterbury. He was appointed chaplain to King James I and installed as Bishop of Salisbury in 1618, but seems to have made very little impression on his diocese. Fotherby died in London on 11 March 1620 and was buried two days later in All Hallows, Lombard Street, where his brother-in-law Francis Dee was rector. Three years later, his daughter Cecily (the third of ten children, only five of which survived their father) married Henry Clifford in the same church. Their firstborn son, named after his eminent forefather, was Martin Clifford (1624–1677), who later became master of Charterhouse and wrote the deistic *Treatise of Humane Reason* (1674) (Tarantino 2000, pp. 15–18).

Impact and Legacy

Fotherby's unfinished *Atheomastix: Clearing Four Truthes, Against Atheists and Infidels: 1. That, There is a God. 2. That, There is but one God. 3. That, Jehovah, our God, is that one God. 4. That, The Holy Scripture is the Word of that God*, was published posthumously in 1622. In this treatise, packed with erudite references, first and foremost to classical philosophy, the bishop

declared himself to be persuaded of the universal assent to the existence of God. Although Fotherby noted that “this is the worst kinde of Atheisme of all other, when as Atheisme is grounded, not so much upon Ignorance, as it is upon the opinion of Knowledge” (*Atheomastix*, sig. B3), he seems to exclude the possibility that there might exist speculative atheists, that is, those who believe “generally and constantly” (p. 99) that there is no God and who reiterate it to the end, “of which sort there can be none, though many have been so reputed and taken” (p. 107). Instead, he defends the appropriateness and urgency of an offensive against “the pragmatic atheists” of his time (“men of the sharpest wits, the greatest spirits, and the richest endowments”), explaining that by them he means only those who outwardly deny (“by outward profession”) the existence of God and not in their hearts (“by inward persuasion”) and, even when they were inwardly persuaded, that was due only to some “sodaine and passionate eruptions.” However, some passages of his work reveal a certain disquiet that the worm of unbelief might in truth be acting on various fronts and having much more devastating and pervasive effects on his age (cf. Berman 1988, pp. 33–34). It is quite simply erroneous, Fotherby comments, “to thinke, that either amongst Christians there can be no Atheists; or, that secret Atheists are not to be convinced, as well as the publique: or that the principles of Religion . . . ought not to be prooued unto those men, of whom they bee already beleueed. . . . For besides the two fore-named sorts of Atheists, the one both in word, and heart denying God; the other in word confessing him, but in heart renouncing him; there is yet a third sort of them . . . who though both in word and in heart they confess him, yet doe they in their works deny him.” As for those “acute Naturalists, who hold it a seruility to be led with brutish-beleeuing, and will therefore entertain no more of Religion then they find to be consonant unto Reason,” they would find in his treatise, he confidently asserted, “reason for their Religion” (sig. B2). Fotherby’s apologetic arguments are rather more original in the second book, *Of the Grounds of Arts*. Here he affirms that every art, whether metaphysical or mechanical, liberal or illiberal, “leadeth a man to

God.” It is impossible for any one person to have a command of all the arts (“they all doe make one single Ring, in that ἐγκυκλοπαιδεία, whereof the Philosophers doe so pleasantly dreame”), and so we rely on an omniscient God to tie together the chain of knowledge (*Atheomastix*, pp. 362, 187). Fotherby significantly preempts the objection that in his work there is “so much Philosophie, and so little Diuinitie,” arguing that for the “adversaries” against whom his book is prevalently directed, the philosophy of pagans has much more importance than the theology of Christians (sig. B4). Ironically, some English freethinkers (aka Fotherby’s “Naturalists”), most notably Martin Clifford and Anthony Collins, would employ a similar – albeit reversed – rhetorical strategy in their own writings, skillfully amassing textual references to unquestionably orthodox Christian authors in order to convey their own deistic if not yet atheistic convictions (Tarantino 2014, pp. 93–94).

Fourlanos, Daniel

Born: 1550, Crete

Died: 1592, Crete

Georgios Arabatzis

Department of Philosophy, Pedagogy
and Psychology, National and Kapodistrian
University of Athens, Athens, Greece

Abstract

Daniel Fourlanos (ci. 1550–1592) was a Cretan physician/philosopher. He commented in Latin upon Aristotle's *Parts of Animals* I in the style of the Aristotelianism of Padua where he studied medicine. Back in Crete, he adopted a more philological approach editing, commenting, and translating Theophrastus and Aristotle.

Biography

Daniel Fourlanos (ci. 1550–1592) was a Cretan physician/philosopher. He studied medicine at the University of Padua as many Cretans did at the time. Crete was then a Venetian colony, and the University of Padua was officially the highest educational institution of the Venetian Republic. The University of Padua's Aristotelianism was distinguished from Florentine Neoplatonism and Roman Neoscholasticism by promoting methodological naturalism. Fourlanos left Padua and returned to his island, where he became an eminent member of the Cretan Academy of *Stravaganti*, a friend and associate of many scholars of the intellectual scene of Candia and beyond like Maximos Margounios (1549–1602), Meletios Pigas (1550–1601), Alvise Luigi Lollino (1552–1625), and Gian Vincenzo Pinelli (1535–1601). He published one volume in his lifetime, and a second one was printed posthumously (See Manoussacas 1974). His first book is characteristic of the training he received in Padua. It is a commentary in Latin of the first book of Aristotle's *Parts of Animals* (See Furlanus 1574). Since Paduan Aristotelianism was mainly

methodological, one can easily understand how Fourlanos's commentary was integrated in his university education. The volume published posthumously includes a collection of works by Theophrastus along with pseudo-Aristotle's *De spiritu*. Fourlanos edited them with corrections, translated them into Latin (except two, for which he used the translations of Andrien Turnèbe), and commented upon them. There is thus a turning point in Fourlanos' career, from his methodological interest for the *Parts of Animals* I to a compromise with a more philological flair that was characteristic of the Greco-Byzantine tradition. In his commentary on the *Parts of Animals* I, Fourlanos is quite critical toward the Byzantine commentator Michael of Ephesus (eleventh/twelfth century) who produced a commentary on the same work. In his second book, Fourlanos' approach is more philological. Interestingly, his edition of Theophrastus's *Characters* employs a succession of chapters that is different from any other early edition of the same work. Fourlanos's engagement with philosophy was enhanced by the cultural ambience; Crete has been for two centuries before he was born a major center for the circulation of Greek manuscripts from Byzantium to Western Europe.

Fox Morcillo, Sebastián

Born: Seville, ca.1528

Died: Seville, after 1558

Alejandro Coroleu

Faculty of Arts, Department of Catalan Language, Universitat Autònoma de Barcelona, Barcelona, Bellaterra (Cerdanyola), Spain
ICREA-Universitat Autònoma de Barcelona, Barcelona, Spain

Abstract

A political theoretician and philosopher, Sebastián Fox Morcillo was born in Seville, where he received his early education. He subsequently enrolled at the University of Alcalá de Henares and in 1548 he relocated to Leuven. Fox Morcillo published commentaries on Plato as well as tracts on Aristotle's natural philosophy, works in which he endeavoured to reconcile both philosophers' teachings. In 1556 Fox Morcillo was appointed as one of the tutors to Don Carlos, son of Philip II.

Biography

Although traditionally he was said to have been a member of the Fox, an aristocratic family stemming from Aquitaine, we now know that Fox Morcillo reverted the order of his family names in order to conceal his *converso* origin. Born into a family of prosperous artisans at Seville in the late 1520s (possibly in 1528), Sebastián Fox Morcillo studied Latin and Greek there under Fray Alonso de Medina. He subsequently enrolled at the

University of Alcalá de Henares and in 1548 he moved to Leuven to study at the *Collegium Trilingue*. The prestige of Fox Morcillo's works, chiefly published between 1554 and 1556, led to his appointment, in May 1556, as one of the tutors to Don Carlos, son of Philip II. We know that Fox Morcillo had returned to Spain by 1558. That year, whilst in Seville, and due to his stay at Leuven, Fox Morcillo became suspicious in the eyes of the Dominican Baltasar Pérez. He instructed an inquisitorial process against Fox Morcillo, whose life must have taken a turn to the worse as shown by the last remaining document related to Fox Morcillo. In it the Spanish humanist is recorded as having been forced to pawn his collection of Latin and Greek books, indisputable proof of his waning fortune. There is no truth in the assertion that Fox Morcillo died at sea. His death must have taken place in Seville shortly after 1558.

Fox Morcillo's first works were an examination of Cicero's *Topica* (now lost), and the treatise *De inventione dialectica*, which was published in 1550. Several works followed, including a compendium of moral philosophy, treatises on history and on imitation, as well as commentaries on Plato's dialogues and a tract discussing a harmonization of Plato and Aristotle on natural philosophy. In 1554 Fox Morcillo published his *De imitatione*, a rhetorical treatise in which he explains the art of perfecting one's style by imitating a model. Divided into two books and portraying a conversation between the author and his brother under the pseudonyms of Gaspar and Francisco Enuesia, Fox Morcillo's text examines the chief elements within the art of imitation: *natura*, *ars* and *exercitium*, and concludes by arguing that Cicero should be the exclusive model for rhetoricians. Dealing largely with politics and with the consequences of moral decisions in a rhetorical way, in Renaissance historiography came to form a fundamental part of the *studia humanitatis* and thus began to be treated for the first time as an autonomous discipline. In 1556 Fox Morcillo published at Antwerp his *De regno et regis institutione libri III*, a dialogue conceived in terms of the Roman moralists between a spokesman for monarchy and another for

republicanism, in which Fox Morcillo shows great confidence in the ability of the prince's educators and advisers to maintain a moral outlook on their prince. Theoretical reflection on history was also the subject of Fox Morcillo's last work, his *De historiae institutione dialogus*, in which history is described as a "narratio vera, ornata et culta alicuius rei gestae aut dictae ad eius notionem hominum menti firmiter imprimendam" (p. 17). In his work Fox Morcillo offers a set of accepted precepts that could draw on contemporary humanist models as well as on models from Greek and Roman historians. Particularly important are the limits of decorous historical discourse: historians must maintain a certain degree of "evenness" (*aequalitas*) that is consistent with the dignity of history. Fox Morcillo also excelled for his commentaries on classical philosophers. Though based on Marsilio Ficino's Latin versions of Plato, Fox Morcillo's annotations to the *Timaeus*, *Phaedo* and *Republic* were extremely critical of the Italian translator. He stated in the preface to the *Republic* that Plato had not been skilfully or properly translated by Ficino. In the end, however, his corrections of Ficino's solutions accounted to only three passages, all of them relating to minor points of biological or medical terminology.

Fracastoro, Girolamo

Born: 1478

Died: 1553

Francesca Maria Crasta

Department of Pedagogy, Psychology,

Philosophy, University of Cagliari, Cagliari, Italy

Abstract

Girolamo Fracastoro was one of the leading figures on the sixteenth-century intellectual scene. Not only is he renowned for his famous poem, dedicated to Pietro Bembo, *Syphilis sive De morbo Gallico libri tres* (Verona 1530), and for his recognized medical expertise, but his fame among historians of science and medicine owes much to the *De sympathia et antipathia*

rerum, the short treatise which introduces the three books *De contagione, et contagiosis morbis et eorum curatione* (Venice 1546).

His work is characterized by the presence of heterogeneous elements, coming from the Neoplatonic and Hermetic traditions, as well as from Lucretius. It can be seen as a solidly philosophical synthesis in which the matrix is, no doubt, Aristotelian and the rationalist imprint is evident. It is exactly within the theoretical framework of Aristotelianism that Fracastoro develops his interest in the problem of knowledge and his attention to the world of experience. His reflections confirm the *lectio* of the ancient philosophers, passing through Ficino's rereading of Plato, the intellectual stimuli deriving from the writings of Giovanni and Gianfrancesco Pico Della Mirandola and the teaching of Pomponazzi. It is partly because of these research themes that Fracastoro's works became particularly popular in the context of seventeenth- and eighteenth-century natural philosophy, which privileged methodological approaches focusing on the concrete "cases" of nature.

Biography

Fracastoro was a pupil of Alessandro Achillini, Pietro Trampolin, Alessandro Benedetti, and Pietro Pomponazzi. He studied and earned his doctorate in Padua in 1502, where he remained as a reader in logic and *conciliarius anatomicus* until 1509. Copernicus was also in Padua at this time, and this intellectually stimulating environment was where Fracastoro received a multidisciplinary education, not restricted to the Aristotelian *lectio*, but engaged with the most diverse aspects of ancient philosophy, both Greek and Latin, with the tradition of the Arabic commentators and with the most recent *studia humanitatis*.

After being appointed physician to the Council of Trent in 1545 by Pope Paul III, he chose to move the council seat from Trento to Bologna, after a typhus epidemic broke out in the area. His *Homocentricorum sive De stellis liber unus*,

published in Venice in 1538 along with *De diebus criticis libellus* had been dedicated to the said Pope. Fracastoro moved in the cultural circles of both Padua and Verona and was particularly close to Girolamo, Marco Antonio, and Giambattista Della Torre. He was also in contact with Gaspare Contarini, Gian Matteo Giberti, Marcantonio Flaminio, and Giambattista Ramusio, with whom he exchanged many letters. He was a member of the Accademia Gibertina and the Accademia Pontaniana.

Fracastoro was a multifaceted author whose interests ranged from medicine to astronomy, from philosophy to theology and poetry, and he stands out for the vast number of works he produced, most of which – the *Naugerius sive De Poetica* dialogues, the *Turrius sive De intellectione*, the *Fracastorius sive De anima*, the unfinished poem entitled *Joseph*, the *De vini temperatura sententia*, his *Risposta al crescimento del Nilo* (in answer to Giambattista Ramusio's *Navigazione e Viaggi*) and the *Carmina* – were published posthumously in the Venetian *Opera* (apud Iuntas, 1555). This first edition was followed by many others, including the Paduan edition printed by Giuseppe Comino in 1739. Instead, several of his unpublished works were published by Francesco Pellegrini in 1955. The edition includes the *Controversia theologica veronese*, a treatise on cosmology based on the *Homocentrica* thesis, together with several of his letters. Fracastoro wrote the above-mentioned treatise after 1530 and submitted it to Gaspare Contarini for his opinion, who replied in *De Homocentricis ad Hieronimus Fracastorium*. Also memorable are his *Alcon sive de cura canum venaticorum* and the letter to Alvise Corner about the Venetian lagoon.

Innovative and Original Aspects

Fracastoro's work is characterized by a multiplicity of interests, even though philosophy remains the main intellectual ground for different aspects of his literary output. The various components of his production can be viewed as part of an organic perspective in which, apart from the

eclectic style of his thought, one can see his actual ability to assimilate and provide an original re-elaboration of various cultural legacies. For example, Aristotelian, Platonic, Neoplatonic, and Hermetic traditions and that stemming from Medieval Culture are able to coexist and weld together in a substantially coherent framework.

At the heart of his investigation lies the conception of a universe governed by laws that exclude any supernatural or miraculous explanation. The workings of the universe are attributed to a hierarchy of physical causes, so that the revolutions of the heavens are connected to the earthly cycles and natural and historical events. This same theme is present in *De sympathia et antipathia rerum*, where the use of a completely natural causality does not rule out the Platonic idea of a living cosmos, governed by interactive elementary principles, in which the intelligent acts of the *anima mundi* become manifest.

In *Homocentrica* Fracastoro criticizes the unnatural nature of Ptolemy's astronomical system, which attempts to "save phenomena" and to explain the anomalies of celestial motions by means of the geometric expedients of eccentrics, epicycles, and deferents, which he defines as "monstrous spheres." He designs a new astronomical model which is inspired by both the principles of Aristotle's cosmology and Plato's idea, found in the *Timaeus*, of a living nature or "big animal." Following on from the theories elaborated in Antiquity by Eudoxus and Callipus and the medieval model devised by al-Bitruji (Alpetragius) in *De motibus coelorum*, translated by the Neapolitan Jew Calo Calonimos and printed in 1531 in Venice, Fracastoro proposes a cosmology that is in complete contrast to the Ptolemaic system. By adopting the homocentric sphere theory, he is able to solve problems related to the anomalies of planetary motion by recurring to the Aristotelian cosmological model, using some of the solutions contained in Averroes' *Commentary* on Aristotle's *De Coelo*. The system is based on the principle that the axis of each celestial sphere is perpendicular to the axes of the spheres immediately above or below it. This effectively brings about an increase in the number of spheres (some 79) moved by the *primum mobile* that

communicates the daily motion to the planets. Each of these spheres is assigned five spheres without stars (*sine stellis*), which circulate in the opposite direction to that of the sphere in which the planet is set. These spheres have the function of offsetting or "reacting" to the drag effect caused by the external orbs, ensuring that the system remains perfectly centered on a single point that is the Earth.

Several scholars attempted to reform the astronomy of the *Almagest* in the name of a science that corresponds to the true nature of phenomena without being too contrived or forced and in line with the original Aristotelian doctrine dictation. For example, we can cite Alessandro Achillini in *De orbibus* (1498), or authors such as Agostino Nifo and, especially, Giovanni Battista Della Torre, whose astronomical heritage was taken up by Fracastoro. Another name to be mentioned is that of Giovanni Battista Amico, author of *De motibus corporum coelestium iuxta principia peripatetica sine excentricis et epicyclis*, published in 1536, which provides significant proof of the ever-increasing sense of unease that was being voiced as regards Ptolemy and the need for simplification of the astronomical model. Regardless of the effectiveness of the proposed solutions, the dominant idea in all these authors' works and particularly in Fracastoro's is the perfectly circular orbit of the planets, assumed as one of the tenets of the difference between celestial and earthly physics, but also as a means of maintaining the symmetry of every part of the cosmos. The *sympathia* and the mutual influence between the celestial and the sublunary world set the cycles of an eternal becoming and the contiguity and contact (*nexus*) between the parts (from the upper to the lower ones) create a kind of physical causality that can be reconstructed by the philosopher and traced back to particular natural cases such as those related to the medical practice.

For Fracastoro, logic functions are an essential *instrumentum* for defining a knowledge oriented towards the natural sciences and especially towards the medical art. In *Turrius*, Fracastoro accredits the philosopher with being able to know phenomena by identifying and describing

their causes. The dialogue examines gnoseological problems and the whole cognitive process is made to depend on the sensitive impressions that are retained in the memory in a stable manner. The mind distinguishes and orders the impressions according to the subjective criterion of similarity, producing *subnotiones* by means of an intermediate activity between the senses and the reason.

The entire cognitive process takes place in the soul, the place where both the primary concepts, derived from the outside world, and the secondary ones originating from reflection converge. It is thus essential for Fracastoro to analyze the ways in which, starting from the senses, the mind gains access to knowledge in a series of increasingly certain and sure steps. The cognition of the universe is achieved by the intellect and is the concluding moment of a cognitive process that begins with the senses. This process does not stop with the still confused acquisition of the sensible *species*, but its activities are increased by the *subnotiones*. This is how the systematic and organic ordering of the knowledge produced by experience comes about, but it also allows the universe to be elaborated with no external intervention. The soul is presented as a power that orders the various universals until the "most general" universal is reached and is powerful enough to make every man's soul "divine." The soul is the place or seat of the intellectual species and it is where the "sensitive spirits" are kept. Fracastoro gives an original interpretation to the Aristotelian doctrine of the intellect: the species acquired by the intellect are the same as those already assumed by sense perceptions, which are now presented in a different way. Perception presents them in a confused manner, while the intellect separates them, distinguishes them, and finally turns them into "universals." This power of logic, which had been examined in the first book of the *Turrius*, has strong links with the hermetically inspired exaltation of man that seems to derive from Pico della Mirandola's *Oratio de hominis dignitate*. The true *miraculum* for Fracastoro lies in the intellect's ability to carry out abstract operations, a power that allows man to be assimilated to "Gods," that is, to separate intelligences.

Fracastoro investigates a series of cognitive acts based on the distinction between true and false, between certain, uncertain, and probable, and which essentially represent the ways in which scientific knowledge is defined in relation to other forms of knowledge. Above all, he reflects on instinct, which is ultimately a form of "intelligence," since it allows living beings, including plants and animals, to achieve their own ends in obedience to divine commands.

He also pays much attention to the problem of deceit, which also includes the cases of errors, amphibologies, and ambiguities resulting from a person's dreams or particular altered states, already pointed out by Ficino. What stands out most of all is the fusion between logical-gnoseological and medical interest which, in the second part of *Turrius*, brings Fracastoro to question which parts of the brain are responsible for the different faculties and how they operate. Thus, intellect, like a king, is at the center of the brain, and common sense, imagination, and memory are topically located in the same place. What emerges from this analysis is a picture of a progressive series of operations that, passing from the senses to reason, allow the individual to acquire the sensible species, transform them into universals and, thanks to the faculties of memory and common sense, develop the sciences and arts.

Against every form of innatism, Fracastoro clarifies the importance of the interaction between the different faculties. The soul is thus presented as a principle of unitary knowledge, even though it is endowed with different faculties. This fact is the prerequisite for research and evaluation of the functions that affect higher cognitive processes. The *phantasia* is the faculty that receives sensory data and, in this regard, is certainly a higher level of knowledge than instinct. Thus in Fracastorian gnoseology, errors do not depend on the senses that are "innocent" and never wrong, but rather they are dependent on the imagination that can deceive by transferring erroneous data to the intellect. This position is an element of considerable interest that would leave lasting traces and reemerge at a later time. In fact, what we have here is a preliminary outline of the significant developments in the process of the

“demonization” of the imagination that came about between the seventeenth and eighteenth centuries.

Fracastoro’s ideas on the transmission of sensory data, modified by the imagination and permanent or transient alterations to a person’s health, discourage any use of interpretations based on magic, while exacerbating the need for a rational explanation of phenomena, in line with the explanatory model provided by Aristotle’s biological works. In the wake of Aristotelian teaching, sensation is the indispensable basis for knowledge while the functions of the mind make up a unitary whole that does not exist independently from the individual.

In such an explanatory model, the concept of *subnotio* becomes particularly relevant: the term coined by Fracastoro designates a subfunction that can provide the soul with a series of notions that were already contained in a confused manner in the sensitive apprehension of object. This is carried out in a single act of learning that constitutes the prerequisite for the processes of composition, reasoning, and memorization. The *subnotio* thus becomes the first step in the activities of the imagination that deploys its power in the subsequent mental processes. There follows the need to define which mechanisms are involved in memory, not only from a strictly theoretical point of view, but also from the perspective of anatomical and physiological research. Memory is brought about by a movement of the soul that extracts the traces of previously deposited recollections from the sensory organs. *Memoria*, *reminiscentia*, *subnotio* can be distinguished by the fact that storing data in the memory does not in itself entail knowledge. Memory takes time whereas *subnotio* can take place in the act of sensation. Thus, memory seems to operate on things that are already known and clearly distinguished by the subcognition, while *reminiscentia* is a more specialized and complex act that permits an already established set of information to be recovered and is therefore a form of learning. If memory involves a passive element, prior to knowledge, reminiscence instead is something active, incited by stimuli that update previously acquired knowledge.

Fracastoro’s *De anima* revolves around the assumption of universal harmony and represents the significant convergence of different research strands in his work. The idea that the moving souls of the various spheres derive from and receive specific *virtutes* from the soul of the world is of certain Platonic ascendancy. Each sphere, just like the human soul, is therefore governed by a specific nature. The celestial origin of the intellectual soul, endowed with the principle of being and of movement, ensures its immortal destiny, which is not shared by the vegetative and sensuous souls whose connection to the body makes them both corruptible and mortal. In turn, the intellectual soul is linked to the body, which it uses as an instrument, but it also has an independent activity that binds it to the cosmic order. The soul’s participation in the eternal, in virtue of its natural affinity with the celestial intelligences, finds its ultimate confirmation within a theological perspective that attests its immortality in accordance with the Christian message of salvation. As far as this subject is concerned, Fracastoro seems to find the possibility of a link between metaphysics and physics in Ficino and develops this theme by identifying two levels of rationality. The first concerns the *status* of the soul as the principle of organic bodies, while the second refers to the Platonic vision of the cosmos as a large animal.

If it is clear that the soul gives life to the body and produces its movement, one should note that it is also a “vehicle” of a vital principle. Such a principle has nothing to do with humors or bodily spirits, which are unable to regulate such a complex process as life. Despite his use of the Renaissance assimilation of *calor* to the *anima*, with specific references to both Hippocrates and Galen, Fracastoro excludes the possibility that the soul can be identified by the complexion or composition of organic bodies. Bodies may have a material disposition, but their qualities are not substantial forms, and thus a principle of life cannot be detected in the complexion of humors.

The hegemonic function of the soul finds perfect symmetry in the cosmological dimension, that is to say, in relation to the world soul. This thesis is clearly in contrast with the affirmations made by Alexander of Aphrodisias, but connected to the

Neoplatonic teachings of Ficino's *De vita coelitus comparanda*, where the body of the world is described as that of a living being, animated by the action of the *spiritus mundi* that animates the universe. Just as the soul of the world is spread through its action on the intellectual souls of celestial bodies which have a natural identity with man's soul, the latter is also dependent on the one soul that governs the physical life of the cosmos.

The link with Ficino is particularly striking when we compare the positions of the two authors as regards the concept of *seminaria*. Fracastoro develops his theory of contagion in *De morbo gallico* and *De Contagione*. Although the concept of divine or celestial seeds (*semina*) is traceable to Ficino's Platonic cosmology, Jean Fernel and Paracelso also developed similar theories in the years between 1520 and 1540. In Ficino's commentary on the *Symposium* (1484), ideas, reasons, seeds, and forms come from God and are spread through the universe by light. It is quite possible that Ficino played a role in the fact that the notion of seed came to be used not only in the metaphysical and cosmological sphere but also in the natural and medical one, even though in the *Consiglio contro la pestilenza* (1481) he seems to advance an explanation of the phenomenon based more on astrology than nature.

In *De contagione* Fracastoro remains within a strictly medical context, and although he does not refrain from using elements from Lucretius, Scholasticism – such as the references to *minima naturalia* – and Pomponazzi, he still manages to outline a well-defined and altogether rich and extremely articulate theory. In fact, this is where Fracastoro puts forwards the concept of contagion that was to make him famous and ensure him a lasting place in the history of science and of medicine in particular. The methodological approach used in *Turrius* and the underlying premise of *De sympathia* have a direct effect on *De Contagione*. “Contagion” is included in the list of *mirabilia naturalia* along with many other curious and seemingly inexplicable cases occurring in nature such as attraction and repulsion phenomena, magnetism, the extraordinary powers of some stones, minerals, substances, and animals or again those related to the fascination and suggestions of the imagination or *vis imaginativa*. Fracastoro strives to explain such

singular or “particular” cases by resorting to natural causality, based on the affinities and antipathies occurring in nature, without calling upon any kind of occult powers or the concept of *actio in distans*.

He offers a new kind of explanation for contagion that is completely different from the one proposed by the *proprietates occultae* theorists and the medical astrological theory he had rejected in the *De causis criticorum dierum libellum* pamphlet of 1538. Both theories blamed contagion on the celestial poisons that resulted from the putrefaction or corruption of the air due to astral conjunctions or to the exhalations caused by the passage of a comet. The problem of contagion is now explained within a natural framework, established by the Creator, and is subject to precise laws which – in accordance with Pomponazzi's teachings – strictly determine worldly events. The nature of contagion is explained as an *infectio* that passes from one subject to another and can be spread in three ways: by direct contact, as in the case of consumption or leprosy; by indirect contact through *fomites*, that is by substances or objects that spread the disease; and finally at a distance, that is through the air, as happens with the plague or smallpox. The *seminaria* are the cause of contagion and are nothing like Lucretius' atoms or *semina morbi*. Instead, Fracastoro assimilates them to small, invisible, and active corpuscles, endowed with autonomous movement, which penetrate through the pores of the body and on finding a suitable *pabulum*, feed and multiply, thereby generating infection and disease. Another essential concept in this case is the necessary analogy or affinity between *seminaria* and receptors, in the sense that the *seminaria contagionum* originates when the right conditions are created for the aggregation of the *minimae et insensibiles* particles, such as happens in the case of putrefaction or infection. *Seminaria* therefore need to find conditions similar to the ones in which they originated or derived from, so that the contagion spreads between the *propter analogiam* bodies, in the sense that they are altered particles that go to “nourish” similar healthy particles, thereby conveying the disease.

Fracastoro accurately identifies the various types of pestilential fevers, as well as the etiology of consumption and especially that of syphilis or

the “French disease” which is dealt with in his didactic poem *Syphilis sive De morbo gallico* composed in Latin hexameters. Using myths and fairy tales, Fracastoro uses a splendid poetic form that still manages to accurately describe the symptoms, course, and treatments of the disease that had been brought to Italy by soldiers in the French army at the end of the fifteenth century. Apart from mercury, among the cures he mentions is guaiac wood or *lignum sanctum*, suggested by the nymph America, guardian of the woods.

The *Syphilis* confirms what Fracastoro wrote in the *Naugerius sive de Poetica*, a dialogue that questions the gnoseological value of poetry. Based on Aristotelian indications, with a tendency to return to Platonism filtered through the works of Ficino, poetry allows the perception of beauty to be combined with the intuition of its idea through the mediation of poetic language, in which the divine force of the word is manifest.

The beauty inherent to the harmony of nature can only be fully revealed by the poet's gaze and words, which are capable of merging philosophy and poetry into a *unicum*, to give meaning and value to the continuous flow of events in which he is able to capture the immanence of the divine. The role he assigns to poetry is another example of how Fracastoro seems to be able to strike a balance between the lessons of the ancient philosophers and those of his contemporaries and to offer a picture of an innovative knowledge, devoted to grasping the natural reality *iuxta propria principia*, in all its dynamic vitality, according to an explanatory model which connects the revolutions of the cosmos and the life of the mind in a harmonious whole.

Abstract

Sebastian Franck (1499–1542) was a writer of moral and spiritual treatises and a Christian

theologian during the Reformation. He trained to become a Catholic priest but ultimately became involved in the Protestant movement as an independent thinker and theologian. His unique approach to the central doctrines of Christianity deviated from and criticized Catholic, Lutheran, Anabaptist, and Calvinist teachings and brought him into frequent conflict with religious and civil authorities in several cities in which he lived. His most influential and controversial books were *Chronica*, *Zeitbuch und Geschichtsbibel* (Strassburg, 1531), *Paradoxa* (Ulm, 1534), and *Das Kriegsbüchlein des Friedens* (1539). Franck's theological writing was marked by a radical, independent, and subjectivist perspective in which he attempted to draw universal connections between the believers of all religious traditions and legitimize their faith traditions.

Biography

Sebastian Franck was born in Donauwörth on January 20, 1499. He frequently referred to himself in his writings as F. von Wörd or Francus Wördensis to mark his city of birth, where his parents were weavers. He studied in Ingolstadt and Heidelberg starting in 1515. At the University of Heidelberg, Franck studied the humanities and theology with the Dominican Collegium and took his vows for Catholic priesthood to serve in Augsburg around 1524. Two years later he changed confessions to become a preacher of strict Lutheranism. Soon he broke with Lutheranism as well and found himself in conflict with Anabaptist teachings. He published a short work while living in Nuremberg called “On the Burden of Drunkenness” (1528), in which he complained of a lack of religious communities that shared his perspective.

Franck married Otilie Behaim, the widow of a rich Nuremberger merchant with familial connections to Dürer's studio, in 1528. The family moved to Strassburg in 1529, where Franck had several likeminded colleagues and where he believed he would find a freer religious society for him to develop his ideas. In his new home, he published the *Türkenchronik* [*Turkish Chronical*]

in 1530 and the *Chronica, Zeitbuch und Geschichtsbibel* [Chronical, Book of Time and Biblical History] in 1531. In both books he began to formulate his belief that both the Bible and nature can act as media for divine revelations. At the same time, he started to teach his belief in the “invisible word” and increasingly developed a spiritualist religious worldview. In the process of developing this theology, he criticized in harsh terms every major confession active in Strassburg and Germany. To Franck, the Catholics, Luther, Zwingli, and the Anabaptists had all failed to reveal the truth of God. Even revolutionary and disruptive theological thinkers clashed with Franck’s claims. As a consequence of Franck’s depiction of him as a “good heretic,” for example, Erasmus of Rotterdam personally denounced Franck and his *Chronica*. Erasmus wrote to the Strassburg town council that they should confiscate his *Chronica*, which they did. The Strassburg government subsequently arrested and then evicted Franck and his family from the city in December of 1531, and he was forced to reside in the town of Esslingen and work as a soap maker until he convinced the city of Ulm to grant him first the right to live in the city and then eventually citizenship.

In Ulm, where he had earned the friendship of the mayor and his son, he was preemptively banned from any form of religious public teaching such as preaching, but he was allowed to make a living as a writer and independent citizen. Franck, who in addition to several influential allies in Ulm also had a fervent enemy named Martin Frecht, pushed his luck with the local Lutheran authorities in the summer of 1534 and published the short religious pamphlet *Paradoxa* (Ulm, 1534) and his *Weltbuch* [World Book and Cosmography] (Tübingen, 1534). The *Weltbuch* described all of the known countries, cultures, religions, and habits of the people around the world, including the New World; and the *Paradoxa* was a 280-sentence treatise on German theology and divine philosophy. Despite the efforts of Frecht, who was in close contact with Martin Bucer and Phillip Melancthon, to block Franck from gaining official rights of citizenship in Ulm, the city council granted citizenship in October of 1534 with the explicit warning that he should

not do anything to antagonize the king, the emperor, or the local religious authorities and that he would refrain from publishing any dangerous books. Frecht and Bucer attempted to influence the city council to make Franck take an oath of allegiance to central tenets of Lutheran faith, but the council, which itself declared not to abide by those tenets, refused to force Franck to abandon his own beliefs to smooth the Lutheran’s ruffled feathers. They saw Franck’s pledge to respect the local religious policies as sufficient.

Perhaps not surprisingly, Frecht continued to harass Franck, and Franck simply could not refrain from publishing his radical ideas. Franck’s *Germania* appeared with permission from Frankfurt in 1538, his *Guldin Arch* [Golden Ark] appeared in Augsburg in 1537, and the *Kriegsbüchlein des Friedens* [War Booklet of Peace] and his *Verschlossen Buch* [Locked Book] appeared without a city of publication in 1539. Fed up with his disobedience, and spurred on by Frecht, the city council finally held him in contempt of their agreement. Despite his defense that these books had been published outside of Ulm or had been granted the permission of external authorities or were published without his knowledge, and without regard to his pleas to have mercy on his four young children and his wife who had been critically ill, the city council voted in January of 1539 to kick Franck and his family out of Ulm. Franck and his family, now grown to five children with a newborn arrived in May of 1539, moved to Basel on July 10, 1539, where he remained until his death from the plague in 1542. His first wife Ottilie died in 1540, and he married again in 1541, this time to Margarete Beck, the daughter of book printer. He published his last work in 1541, *Die deutschen Sprichwörter* [German Proverbs] in Frankfurt, and he released a revised edition of *Paradoxa* in 1542.

Franck’s nemesis Frecht remained determined to ruin the man even after he had succeeded in expelling Franck from Ulm; he secured a handwritten and signed condemnation of Franck from Melancthon himself in March of 1540 and brought it back to Ulm as a *coup de grace* for the town council. In a German paraphrase of the condemnation, Melancthon called Franck a “crazed spiritual wreck,” and he continued to

mock Franck in his lectures as a “poisonous enemy of princes and learned men” and his students as “the apostles of Franck’s historical confectionary” (Weinkauff 1878). Luther, for his part, weighed in on Franck’s teachings and character shortly after the radical thinker had died. He wrote that Franck had privileged himself as a judge and master over the letter of the Bible, but he had also strived to think and to be his own master as an independent thinker and free spirit.

Heritage and Rupture with Tradition

Sebastian Franck was an early prominent convert to Lutheranism, but he encountered several conflicts within the Protestant movement because of his determination to critique aspects of all organized religions. His staunch individualism, which grew out of the Lutheran commitment to the believer’s responsibility for reading and understanding the Word of God, pushed beyond *sola scriptura* to conceptualize the Word of God as transcending the written scripture. For Franck, the interaction of the believer with scripture, with nature, and with the teachings of the ancients allowed for the experience of the Word of God as a living revelation accessed by the individual in a dynamic and ongoing way. Franck had trained to become a Dominican priest and also served as a Protestant preacher, and he came to see Luther’s doctrine of scriptural primacy as a substitution of one kind of papacy with another. Belief, for Franck, was not something that one could institutionalize but rather a radically subjective experience of the divine. Although he was clearly entrenched in the Reformation movement, Franck portrayed his views as “unparteiisch” (nonpartisan), and he felt that the true church was not one that could be seen or codified but rather was an imaginary and invisible collective of true believers that transcended man-made religious confessions. Franck’s training in Humanism also gave him a unique perspective on the history of the world, as found in his *Chronica*. Franck saw the history of the world as a tale of institutions that suppressed the true believers who cropped up throughout the ages: most often those who were

labeled as heretics. His historical works, which are mostly compilations, provide a broad perspective on faith and culture from around the world. He portrays religious divisions and blind commitments to doctrine and ritual as destructive social conditions that lead to unnecessary war and violence.

Innovative and Original Aspects and Impact and Legacy

Franck’s rabid individualistic approach to issues of faith, social order, and even language were not especially well received during his lifetime. Dogged by hardline Reformers around Germany, Franck found himself constantly at odds with theologians who preferred dogmatic approaches to faith. Even creative and innovative theologians like Erasmus of Rotterdam and Martin Luther found serious problems with Franck’s subjectivist religious worldview.

Franck’s analysis of the written word served as the foundation of his belief system. His claim that the scripture is not the word of God, but rather the product of men, and his belief that the Book of Nature and the wisdom of the ancients could serve as legitimate media for coming to know God struck at the authority of all Christian faiths. However, this questioning of the primacy of the written word and his claim that there were many ways of knowing resonated with secular debates that were taking place in humanism and natural philosophy, as well. The flaws of human writings suggested that there might be another kind of text that could reveal the truth. For Franck, as he explicates in the *Kronbüchlein* (1534), God’s Word transcends the graphic and phonetic limitations of human language; therefore, the expression of God also lies beyond the realm of human speech. Yet, paradoxically, the scripture – among other kinds of written and unwritten texts – is one of many ways humans come to believe, and it is their responsibility to interact with these texts in a way that reveals the Word of God to them. The theological relevance of Franck’s beliefs about how the written word, namely, scripture, operates cannot be understated. His claim that the individual had sole authority

and responsibility over their encounter with the Divine Word aimed to strip both the Protestant and Catholic Churches alike of their authority to control the beliefs and behaviors of their followers. Franck's conflict with civil and religious authorities in Ulm between 1534 and 1539, in fact, demonstrated in real life exactly what was at stake in his argument. Although he repeatedly claimed to support both the religious and civil authorities of Ulm, and made no claim to his ideological or moral superiority, Franck's radical ideas became the battlefield for a political proxy war between the authority of the secular town council (backed by the mayor Bernard Besserer) and the authority of the local Lutheran religious leaders (whose interest was pressed by Martin Frecht). In addition to his impact on epistemology and theology, then, Franck was embroiled both theoretically and practically in questions of shifting social order. He frequently and vehemently claimed to abhor rebellion and religious strife and did not comment as Luther did on the Peasants' Revolt in 1525, but his writings – both historical and theological treatises – tolerate rather than praise man-made institutions of authority, both religious and secular alike.

Among contemporaries, Franck was fairly alone in his subjectivist theology, although he had several friends and allies who encouraged and supported his work. After his death, leaving behind six children and his new bride Margarete, Franck's ideas gained some traction in Dutch speaking lands, and many of his notions about the "invisible church" resonate in the religious treatises of Hugo Grotius in the seventeenth century. But the most powerful praise and assessment of Franck's legacy comes from Wilhelm Dilthey, who notes that "Franck's ideas have flown into the modern time through a hundred channels" and depicts him as the "precursor and founder of modern religious philosophy" (Dilthey 1957: 85).

Friendship, Renaissance Understanding of

Ulrich Langer

Department of French and Italian, University of Wisconsin, Madison, WI, USA

Abstract

Friendship in the Renaissance is an intensive bond between men, within the *societas* of humanity, defined most successfully by Aristotle in the *Nicomachean Ethics*. This article rehearses definitions of friendship (and their critique) and gives an account of how these definitions were diffused in early modern culture.

Overview and Definitions

In distinction to later, post-Hobbesian views, and in contrast to the presuppositions of Machiavelli's *The Prince* (1532), the consensus in moral philosophy of the fifteenth and sixteenth centuries saw human beings as naturally inclined to social living and as naturally benevolent to fellow human beings, on a scale of diminishing intensity from the family to humanity as a whole. The cement of

this benevolent interdependence is the exchange of goods and services, material and otherwise. The classic statement of this natural *societas* of humanity is found in Cicero's *De officiis* (I.vii.22). The social-human bond does not imply equality of partners; in a way, the imparting of duties or services to each other (*officium* or *beneficium*) is predicated on a degree of inequality. The Christian bond of charity (*caritas*, *agape*), in contrast, does imply an equality enabled by the finality that is the love of God; in contrast to friendship, it is thought to be nonspecific and is less articulated in the sphere of moral philosophy itself.

In the Renaissance, the bond of friendship (*amicitia*, *philia*) can be understood first of all as a general category of beneficent voluntary and natural relationships, elements of social cohesion, and in this sense it participates in the *societas* of humanity. This wide-spread loose use of the term is so vast as to frustrate attempts at an exhaustive account. Indeed, various natural "sympathies" – between elements, between species – are sometimes called "friendships" (see Erasmus' colloquy "Amicitia" [1531]). Political and business client relationships can be subsumed under the term as well (see Leon Battista Alberti's *Della famiglia* [begun 1432], and in particular the fourth book); from Plutarch's "How to Distinguish the Friend from the Flatterer" (from his *Moralia*) to Castiglione's *Libro del cortegiano* (1528) and the abundant court (and anticourt) literature of the sixteenth century, the term "friend" has a vague sense of someone who wishes you well rather than someone who is merely pursuing his own interests.

Renaissance moral philosophy is concerned, in addition, with a stricter use of the term "friendship," largely following the most common classical sources. These are Cicero's *Laelius de amicitia*, Aristotle's *Nicomachean Ethics* (books VIII and IX) and, to a lesser extent, the *Eudemian Ethics* (book VII), Seneca's *De beneficiis*, and Plato's dialogue *Lysis* (for a discussion of classical friendship in the main sources, see Fraisse 1974; for medieval understanding and transmission especially of Aristotelian notions of friendship, see Sère 2007; for a more elaborate presentation

of Renaissance friendship, see Langer 1994). Reflection on friendship is usually articulated not in the form of arguments for propositions (if one excepts scholastic argument on the relation between charity and friendship, such as Thomas Aquinas, *Summa theologiae*, II-2 qu 23); instead, it is centered on some commonly accepted definitions, such as Cicero's *Est enim amicitia nihil aliud nisi omnium divinarum humanarumque rerum cum benevolentia et caritate consensio* ("For friendship is nothing else than an accord in all things, human and divine, conjoined with mutual good will and affection") (*Laelius de amicitia* VI.20). One finds innumerable repetitions and refinements of this definition, insisting, for example, as does Scipion Dupleix, on the voluntary nature of the friendship bond: *[L]'amitié est une conformité des volontez entre deux ou plusieurs personnes, laquelle procedant de la mutuelle cognoissance qu'ils ont de leur vertu et integrité des moeurs les conjoint à une vie honneste* ("Friendship is a conformity of wills among two or more persons, which, deriving from a mutual knowledge that they have of each other's virtue and integrity of conduct, binds them together in a morally honest life") (Dupleix 1994, VII.6.viii, p. 441–442; Montaigne in his *Essais* ["De l'amitié," I.27, 1580, 1588] insists similarly on the voluntary nature of friendship, in contrast to family bonds). Friendship originates in knowledge of the other person, not in physical desire (and thus is, at this level at least, distinguished from love, *amor*, or *eros*, although especially in Platonic contexts the boundary is less clear). Knowledge of another person's virtue assumes knowledge acquired over time, as virtue is not punctual but a *habitus* demonstrated through repeated deliberate action. Hence the requirement that friends spend time with each other, or, as the saying goes, that they have consumed an amount of salt with each other (Aristotle, *Nicomachean Ethics*, VIII.3.8, 1156b27).

Friendship is divided, after Aristotle (*Nicomachean Ethics*, VIII.3.1–4.5, 1156a6–1157a35), into three types, according to its cause: as the Latin tradition formulates it, they are friendship for the sake of pleasure (*propter*

delectabile), for the sake of usefulness (*propter utile*), and for the sake of moral goodness or virtue (*propter honestum*). For example, lovers are thought to be drawn to each other for the pleasure they provide to each other, but also friends who like to drink or eat together. Business partners or thieves are friends because of the usefulness or gain they procure to each other. Virtuous men are friends for “themselves,” that is, for the sake of the choices and habits that they make as persons, in similar fashion. Indeed, all friendship is based on resemblance, not on difference, and if friends are unequal (in wealth, in power, etc.), there has to be some element of resemblance that is the basis of their friendship. Friendship *propter honestum* can subsume the other types, in the sense that virtuous men can derive pleasure and usefulness from their friends, as a complement to their friendship, although pleasure and usefulness will never constitute the finality of their relationship. The most important distinction between virtuous friendship and the two other types is the temporary nature of the latter: when pleasure or usefulness are no longer present, the friendship ceases, whereas virtuous friendship is thought to be long-lasting, as virtue is not a momentary choice but manifested in repeated and quasi-permanent dispositions. A virtuous friend can become as “another self,” hence, also, the relative paucity of such relationships. Having many friends is a sign of the weakness of the relationship (see [Plutarch](#), *On Having Many Friends*, from the *Moralia*) or of their status as friendships per usefulness or pleasure. Virtuous friendship is not always permanent: if the friend becomes a worse person, through his choices, then his friend should attempt, by admonishment, to correct the wayward friend, and if he doesn’t succeed, he can consider that the former friend has become a person “of another sort” (Aristotle, *Nicomachean Ethics*, IX.3.3, 1165b14–23) and it is then not unnatural for the friendship to be broken off.

The devotion of such virtuous friends for each other is expressed through a fairly compact series of examples, although Renaissance compilers do their best to add to the list. It is important to note that they are exclusively male; although there are lists of examples of “illustrious women” (the most

evident examples being Boccaccio’s *De claris mulieribus* [1374] and Christine de Pizan’s *Livre de la cité des dames* [1405]), they do not come in pairs of friends, as it were, and neither does one find examples of female–male friendship, although *amicitia* can on occasion become a recommended basis for marriage. The classical examples of (male) friends are the legendary Orestes and Pylades, Achilles and Patroclus, Aeneas and Achates, Euryalus and Nisus, Damon and Phintias (or Pythias), and Jonathan and David. Lucian’s *Toxaris* is a comparison between Greek and Scythian heroic friends. They are ever-present in Renaissance moral exempla literature, and versions of them appear in epic romance (such as Cloridano and Medoro in Ariosto’s *Orlando furioso* [1st version 1516], Books 18 and 19). They demonstrate their commitment to each other in the most extreme situations, such as epic warfare or struggle against tyranny. The duties of such friends to each other include protecting the other’s life, detecting and indicating plots against the other, defending and not abandoning the other in dangerous situations, freeing the other from prison, improving the other’s mores, not revealing the other’s secrets, providing for the other’s children, and regretting the friend’s death (according to the summary in Zwinger 1586, Vol. 18, Lib. 2, p. 3315–3316). As Cicero, quoting Ennius, says it, *amicus certus in re incerta cernitur* (“the true friend is discerned in times of trouble”) (*Laelius de amicitia*, XVII.64; see also [Ovid](#), *Tristia*, I.9.24: *in duris remanentem rebus amicum*, “a friend steadfast in times of stress”).

Diffusion and Reception

The diffusion of notions of friendship in Renaissance intellectual culture is practiced on many levels: first, mostly in academic settings, in commentaries and Latin translations of Aristotle’s *Nicomachean Ethics*, scholastic and humanist (see [Lines 2002](#)). These notions are also absorbed through the Ciceronian moral corpus (usually thought to be compatible with Aristotle), in the study of rhetoric, and generally in the juridical

and, depending on the country, aristocratic milieu of the sixteenth century. On a somewhat less traditional register, intending a wider audience, common notions about friendship are diffused through vernacular translations or adaptations of Aristotelian moral philosophy (such as Alessandro Piccolomini's *Della institutione morale* [1560]) and are elements of the *trattatistica* in early modern Europe. Platonic and neo-Platonic notions of friendship filter in through translations of the *Lysis* and in the dialogue literature of the sixteenth century, in uneasy coexistence with eros.

Second, collections of epistles and the practice itself of epistolary exchange among intellectuals contribute to the availability of classical ideas on friendship. Examples are Seneca's *Epistulae morales ad Lucilium*, Petrarch's *Epistolae de rebus familiaribus* (1359) (especially 18.8), and the vast correspondence of Erasmus (see Eden 2001).

Third, the memorable notions about friendship are reproduced in concentrated form in the collections of proverbs and apophthegms of the period, most famously by Erasmus who features two proverbs at the beginning of his *Adagia* (1500–1536): *Amicitia aequalitas* and *Amicus alter ipse* ("Friendship is equality" and "The friend is another self," I.i.2). More generally, sections on *amicitia* are de rigueur in the burgeoning literature of "commonplaces," from the *Polyanthea* (1st ed. 1503) by Domenico Nani Mirabelli (which was augmented until well into the seventeenth century), Ravisius Textor's *Officina* (1st ed. 1503), to Theodor Zwinger's *Theatrum vitae humanae* (1st ed. 1565) and compendia in dialogue form such as Pierre de la Primaudaye's *Academie françoise* (1st ed. 1577).

Critiques and Development

Finally, perhaps more interestingly, there are critiques of friendship *propter honestum*. First, at the least implicitly, from a theological perspective. As an element of the virtues, or their most complete manifestation, friendship should take a second place to the love of God and charity. Loving

another as an end in itself is not a proper relationship to another human being; only God should be loved for his own sake (see Peter Lombard, *Sentences*, I dist 1 cap 1–3). Then there are isolated cases of paradoxical treatment of friendship: it is taken, apparently for the sake of argument *in utramque partem*, as something to be blamed, not praised. Antoine Hotman, in his *Deux paradoxes de l'amitié et de l'avarice* (in the *Opusculs françoises des Hotmans* [1616]), argues that friendship is an exclusive "passion" taking us away from our social and religious obligations and affections.

Since friendship as a philosophical topic is hardly separable from its representations in the literary culture of the time, a further area to be explored is the motivation for relationships of friendship in literature. Especially newer literary genres such as the novel or the novella step outside the models given to the Renaissance by classical epic friends. A more modern understanding of friendship is hinted at by narrative scenarios that feature friends who are not equals and do not resemble each other. At times, the representation of friendship begins to exclude it from explanation, contrary to classical models, and it becomes an affective sublime (see in particular Montaigne's account, or nonaccount, of his friendship with Etienne de la Boétie, in "De l'amitié").

Gaetano da Thiene

Born: 1387, Gaeta, Italy

Died: 1465, Padua, Italy

Tommaso De Robertis
University of Pennsylvania, Philadelphia, PA,
USA

Abstract

Gaetano da Thiene was a professor of logic and natural philosophy at the University of Padua from 1422 to 1465. As a student of Paul of Venice and later a teacher of John Argyropoulos and Nicoletto Vernia, Gaetano provides an ideal illustration of the connections between two different generations of Italian Aristotelian thinkers from the fourteenth and fifteenth centuries. Gaetano's works on logic and natural philosophy contributed to the diffusion of fourteenth-century French and English philosophy in Italy. Although influenced by Averroes' philosophy during his university years in Padua, Gaetano was not a committed Averroist. In his works, he rejected both the doctrine of the eternity of

the world and the ingenerability of the intellectual soul. Gaetano's commentaries on Aristotle's logic and physics enjoyed wide circulation from the late fifteenth century up to the first half of the sixteenth.

Biography

Gaetano da Thiene was born in 1387 in Gaeta, a city of Southern Italy where his father was working as a jurist in the entourage of the king of Naples, Ladislao D'Angiò Durazzo. While still very young, he moved to Padua, where he was raised by his paternal grandmother (Gaetano's family originally came from Veneto). In 1418, Gaetano graduated in Arts from the University of Padua, where he had among his professors Paul of Venice, one of the most prominent Aristotelian philosophers of the time. Upon graduation, Gaetano left Padua for a few years, probably to escape the plague. When he came back in 1422, he was appointed professor of logic at the university. While lecturing in Padua, Gaetano also pursued a degree in Medicine, which he completed in 1428. In 1430, he was assigned to the chair of natural philosophy, which he held until his death in 1465. During his 43 years of uninterrupted activity, Gaetano had among his students many prospective illustrious thinkers: Martino Tomitano, Lauro Quirini, John Argyropoulos, and Nicoletto Vernia (who would succeed Gaetano in the chair of natural philosophy in

Padua). Although Gaetano does not seem to ever have taken vows, in 1436, he was appointed canon of the cathedral of Padua by Pope Eugene IV and held important offices in the Paduan Curia for all his life (Da Valsanzibio 1949, 1978; Bernardinello 1984).

Gaetano's literary output originates from his teaching activity, and it reflects his academic trajectory as a professor, first, of logic and, later, of natural philosophy. As for the former field, Gaetano's earliest works are all commentaries on the logical writings of William of Heytesbury, Ralph Strode, and Richard Ferrybridge (da Thiene 1483, 1488). At that time, reading these eminent English logicians' works was mandatory for students in the Faculty of Arts at the University of Padua (Bottin 1983, 125–126). Later on, during his 35 years as a professor of natural philosophy, Gaetano authored sets of commentaries on Aristotle's physical works (*Physics*, *Meteorology*, *De anima*, *De coelo et mundo*), treatises on specific issues of natural philosophy (*Tractatus de reactione*, *Tractatus de intensione et remissione formarum*), as well as sets of *quaestiones* (*Quaestiones duodecim philosophicae*) (da Thiene 1475, 1476a, b, 1481a, b, 1491, 2008). With his works, Gaetano contributed significantly to the spread of English and French philosophical theories in fifteenth-century Italy. While his works on logic proved important for the diffusion of the views put forward in the fourteenth century by the so-called Oxford Calculators, Gaetano's physical treatises and commentaries incorporated doctrines originally presented by eminent French schoolmen from the fourteenth century, such as Jean Buridan and Nicole Oresme (Bottin 1983; Caroti 2006).

Although Gaetano was certainly influenced by Averroes' philosophy during his university years in Padua, as a thinker he can by no means be labeled as "Averroist." While his intellectual contribution lays within the framework provided by Aristotle's philosophy, he cannot be really attached to any philosophical orientation or school in particular. In his works on natural philosophy, for instance, he rejected Aristotle's

doctrine of the eternity of the world, a theory that would become one of the central and most controversial tenets of Averroes' interpretation. In his commentary on Aristotle's *De anima*, Gaetano refuted another core principle of Averroes' reading of Aristotle, that is the notion that the intellectual soul is ingenerated and incorruptible. At the same time, however, there are places within Gaetano's work where he sees substantial continuity between Averroes and leading Christian thinkers such as Albert the Great, Thomas Aquinas, and Giles of Rome (Da Valsanzibio 1949, 199). Gaetano's Aristotelian commentaries are a clear witness both to his outstanding familiarity with the earlier philosophical tradition (both ancient and medieval) and to his capacity to incorporate and critically examine different, and often contrasting, philosophical positions. Gaetano's commentaries were reprinted several times throughout the fifteenth century and well into the sixteenth, a fact that illustrates their wide appreciation from the scholarly community of the time.

Galen and Galenism

Born: 129, Pergamum [Asia Minor]

Died: After [?] 216 in an undetermined place

Alain Touwaide

Institute for the Preservation of Medical Traditions, Washington, DC, USA
The Huntington, San Marino, CA, USA

Abstract

A physician born in 129 in Pergamum (Asia Minor) and educated in Smyrna and Alexandria, Galen started his career as a physician to the gladiators in Pergamum until he was called to Italy by the co-emperors in 168. He then spent most of his career in Rome, taking care of the imperial court and also treating other patients, and died sometime around 216. Thanks to his position, he could devote himself to research and writing, producing an all-encompassing *oeuvre* in addition to assembling a vast library collection. Attracted to philosophy in his early years, he never lost this interest and built a robust medical system that combined accurate observation of facts with rigorous rational analysis. The influence of his *oeuvre*, identified as *Galenism*, was enormous. Whereas his treatises were differently transmitted in Byzantium, several were translated into Syriac in the sixth century CE and into Arabic in the ninth century. Many such Arabic versions and the original works that they generated were translated into Latin in the West from the late eleventh century on, and they gave a new impulse to medicine in the fourteenth century. In the Renaissance, the Galenic *oeuvre* went through three successive phases: the reappropriation of Galen’s method, the recovery of his text in the original language, and the critical analysis of Galen’s data. At the end of the sixteenth century, Galenism arrived to an end, leaving the field of medicine open to a revival of Hippocratism.

Alternate Names

Galen; Galenus; Galenus, Claudius

Biography

Born in 129 to a successful and wealthy architect with broad interests in Pergamum, Galen received a good education in his native town. Early exposed to the theories of the major philosophical schools of his time, he shifted interests after his father had a dream in which Asklepios appeared to him. At age 16 Galen started studying medicine with local teachers and from ca. 149 in Smyrna. Further on, he traveled to Corinth to study with another teacher who, in the meantime, had left the city for Alexandria where he died before Galen could join him. Arrived there sometime around 151, Galen attended the lectures of the school until 157, when he returned to Pergamum. Thanks to his ability as an anatomist, he obtained to be appointed physician to the school of gladiators in the city. In 162, he left Pergamum again, going to Rome where he earned some reputation as a philosopher. His successful treatments gave him access to the upper class. Possibly by fear of the jealousy of his rivals as a result of his spectacular public anatomies or because of an outbreak of plague, he discretely left Rome in 166 and returned to Pergamum. His stay there was brief, however, as he was called in 168 by the co-emperors Marcus Aurelius (reign 161–180) and Lucius Verus (reign 161–169) to join them in Aquileia, in Italy, where they were stationed with the troops. From there, Galen returned to Rome in 169 to become a physician to the imperial court, particularly Marcus Aurelius' son, the young Commodus (161–192). Though attached to the court and treated the emperors and their circle until his death, he also attended other patients. More than anything else, he devoted himself to research and writing, assembling a massive library collection (partially destroyed by the fire that ravaged the city in 191) and producing himself an immense *oeuvre* that

covered all aspects of contemporary medicine. He died at an unknown date, ca. 216.

Heritage and Rupture with the Tradition

Through his education and his extensive readings (possibly started in his early years in the rich library of his father), Galen came in contact with all the medical knowledge available in his time, which he perfectly assimilated and brilliantly mastered. Deeply penetrated by Hippocratic medicine, he also had a profound knowledge of the anatomical investigations performed by the physicians of the early-Ptolemaic school of Alexandria among whom Herophilus of Chalcedon (335–280 B.C.) and Erasistratus of Ceos (304–250 B.C.). In addition he exactly knew the theories of the different schools of medical thinking which flourished in previous periods, including the most recent and radical methodism professed by Asclepiades of Bithynia (second/first century B.C.), and assimilated – or had access to – a sheer quantity of information, from the immense *De Materia Medica* compiled by Dioscorides during the first century AD to the innumerable collections of formulae for compound medicines en vogue from the first century AD on.

With extraordinary mastery, Galen dominated all the components of medical knowledge, to which he added his personal experience gained through his activity as a physician to the gladiators in Pergamum and the multiple anatomies performed on animals in Rome, first in public and, subsequently, only privately, to both deepen his knowledge of anatomical structures and discover functional and physiological mechanisms. To that, one must add the travels he made to have a direct knowledge of some *materia medica* typical of specific regions and experiments duly organized on animals and aimed, for example, to determine the lethal and sublethal dosage of toxic substances.

The synthesis Galen made of this immense sum of information was not exempt of bias even regarding his major source of knowledge and inspiration, Hippocrates and the *Hippocratic*

Collection. In his several commentaries on Hippocratic works, Galen appropriated Hippocratism and interpreted it in his way, often trying to attribute to Hippocrates elements that he regarded as fundamental and at the same time exactly reproducing the theories that made the substance of Hippocratism. Of the followers of Erasistratus in Rome, he harshly criticized the theories on sphymology, and, of Asclepiades of Bithynia, he systematically refuted all the theory, almost provoking a *damnatio memoriae* such that none of Asclepiades' work has been preserved. Even if he expressed respect for Dioscorides, he incorrectly contradicted him on some points in lengthy discussions, while, at the same time, he reproduced much of his information without mentioning the source. Similarly, in the treatises on therapeutic, he presented as his – to the very least by default – many formulae for medicines authored by predecessors and contemporaries.

Innovative and Original Aspects

Based on his assimilation, transformation, and also rejection of previous medicine, Galen built a monumental rational edifice which was sustained by a solid conceptual and methodological foundation. Avoiding philosophical debates, he firmly believed that medical knowledge – and, by way of consequence, therapeutic action – had to be based on bodily facts accurately observed with all senses and subsequently decomposed by a rigorous causal analysis relying on a materialistic physics and proceeding according to a strict logic.

Accurate definitions went together with logical divisions and concatenations, measurements, and proportions. Later in his life (possibly circa 193), Galen wrote the treatise traditionally identified as *Ars Medica* according to the medieval translation of its title, although it would probably be best identified by a more exact translation of its Greek title as *Medical Technique*. After a cryptic prologue on three methods of teaching that generated multiple commentaries through the centuries until Leonicensio in the Renaissance (below), Galen made a systematic presentation of pathology possibly aimed at both the neophytes who

were learning medicine and the practicing and experienced physicians for whom the work was a handy synthesis. Proceeding by definitions and divisions resulting in a clear exposition with a solid architecture, Galen compiled a state-of-the-art manual of pathology in which he also synthesized all his thinking in this field. Characteristically enough, he closed the work by including a list of his own treatises, listed according to the organization of medical knowledge that he illustrated in *Ars Medica* itself.

Galen's method is probably well exemplified in sphymology and remedial therapy, besides anatomy. In the analysis of the pulse, Galen introduced a complex system of measurements based on several parameters: in the diastole, dimension (with three axes length, width, and depth), rhythm, and strength, in addition to state of the vessels; in the systole (which was not easily perceptible according to him), the time elapsed between contractions; and the patterns in any sequence of systole and diastole. To describe each of the resulting descriptors of pulse according to these parameters, he coined a vast and expressive lexicon, many items of which are based on metaphors (e.g., the “goaty” pulse, characterized by unpredictable irregularities, like goat's jumps). In remedial therapy, Galen formulated a system of measurement of the properties of materia medica based on the four basic qualities (dry, wet, hot, cold) which he brought together in two couples of opposites. For each of them, he defined four degrees of intensity. In the bi-directional axes created in this way, he introduced a zero value, which is the point where both opposites neutralize each other. Going further, he linked these qualities to the four matters of the world (air, water, earth, and fire), which were present in each materia medica in the form of particles of different shapes and weight in a way reminiscent of the methodism of Asclepiades of Bithynia whose theory he sharply refuted.

For each component of medicine he analyzed, Galen wrote long and deftly articulated demonstrations that left nothing untouched, sometimes returning to arguments previously dealt with. The vastness of his analysis is required in certain cases to synthesize his thinking in shorter and simpler

manuals aimed to novices. Galen's overarching methodological principle, mostly Aristotelian in nature, was not incompatible, however, with a Platonic interpretation of anatomy and a Platonizing concept of the soul, which opened his strict medical system to psychology and ethics.

Impact and Legacy

Through his powerful analytical faculty supported by strict rules of logic, Galen transformed medicine from naturalistic Hippocratism to a systematic discipline ruled by precise methodological procedures coupled with solid reasoning principles. Galen's general approach to medicine was mostly embraced in subsequent centuries – generating what has been rightly called Galenism. In Byzantium, the physicians of the early centuries of the empire successively sought to synthesize and articulate in a coherent set Galen's multifaceted work. These were the encyclopedias of Oribasius (the fourth century) and Aetius (the sixth century) and the more succinct manual of Paul of Aegina (the seventh century), the last representative of the Alexandria medical school before its conquest by the Arabs. Also, a canon of Galenic texts was assembled in the Alexandrian school of medicine, which formed the basis of medical education in the school, with a possible expansion to the West and certainly in the East. As early as the sixth century, some of Galen's treatises were translated into Syriac, and in the ninth century many of them into Arabic. With the possible exception of some of his manuals for students, not much of Galenic medicine was known in the West during the same time. Further on, however, the Arabic version of several of his treatises was translated into Latin, starting with Constantine the African in the late eleventh century. In the following century and until the early fourteenth, new Latin translations were made on the basis of the Greek text. This injection of theoretical thinking provoked a new dynamism in medicine in the West, particularly in such school as Montpellier.

Along this long and sometimes tortuous roads, some of the multiple Galenic treatises were lost, including the original Greek versions.

Furthermore, in this vast odyssey, not all components of the Galenic system were reproduced in the same way along the centuries. In Byzantium, for example, Galen's system of remedial therapy characterized by its materialization of the therapeutic activity was not much followed, contrary to what happened in the Arabic World, where this system was embraced by ibn Sina in his *Qanun of Medicine*. The Byzantine World definitely preferred the holistic system of Dioscorides, *De Materia Medica*, more descriptive in nature. In sphygmology, instead, the complex Galenic system and its vast, yet precise lexicon were abundantly used in Byzantium, including by the physicians of the last century of the empire.

In the Renaissance, Galenism went through three major successive phases from the late fifteenth century to mid sixteenth century. After a first reappropriation of Galen's method, its text was recovered, and further its data were assimilated and submitted to critical analysis.

In the first of such phases, Galen's method, best represented by the *Ars Medica*, was brilliantly brought to light by the Ferrara physician Nicolò Leonicensio (1428–1524), who owned a vast library collection comprising many Galenic medical treatises. In *De tribus doctrinis ordinatis secundum Galeni sententiam* first published in 1508 with several reprints further on, he definitely transformed the interpretation of the treatise – particularly its cryptic prologue on three teaching methods – and he put an end to its medieval readings. In so doing he opened a new era in the reception of Galen's immense opus, the multiplicity and numerous inconsistencies and contradictions of which resulted in uncertainty.

In the second phase, the increased interest in Galen's Greek text promoted by Leonicensio's activity, together with the gradual development of medical humanism, certainly generated the need for an edition that would collect all known treatises of Galen. It was the merit of Aldo Manuzio's successors in Venice to produce such a monumental work in 1525. Multiple new editions and Latin translations followed, which brought back treatises and components of Galenic medicine that had been lost or forgotten through the centuries. These works allowed for a

refoundation of medicine now based on solid philosophical principles. Medical teaching in universities was revitalized, and medieval textbooks – mostly of Arabic origin – were soon replaced by the lecture of, and commentary on, Galenic texts.

Renewed availability of texts, particularly in anatomy, led to the third phase of Renaissance Galenism, characterized by the factual verification of Galen's data. In Padua, the Belgian-born physician Andreas Vesalius (1514–1564) submitted Galenic anatomy to a systematic analysis through dissection of human corpses. Walking in the footsteps of Galen himself, he adopted his methodological precepts, something that made it possible to identify the limitations of Galenic anatomy resulting from the use of apes' bodies (sometimes still living) instead of human corpses, and the inference of structural identities between the animal and the human worlds. Vesalius' work resulted in precise textual analysis of Galen's original treatise and new descriptions visually rendered by fine anatomical drawings. This sum of information was printed in Basel in 1543 and opened a new era in human anatomy that rapidly put an end to Galenism, even though Galen's medicine remained mainstream until the end of the sixteenth century circa, when it was replaced by the Hippocratism that it had eclipsed during the century.

Primary Literature

The Greek text of all the Galenic treatises known up to the early 19th century has been published (on the basis of earlier editions) with a Renaissance Latin translation in the monumental 20-volume version edited by the German physician and historian of medicine Karl Gottlieb Kühn (17–18) from 1821 to 1833 in his collection *Medicorum Graecorum Opera quae exstant* (Leipzig: K. Knobloch, 22 tomes). This edition has been

reprinted in the 20th century (Hildesheim: Olms Verlag) and more recently (Oxford: Oxford University Press). A new edition (with facing French translation) is currently being published in the Collection des Universités de France (Paris: Belles Lettres). Some works are available with an English translation in the Loeb Classical Library, and several treatises have been translated into English during the 20th century on the basis of Kühn's edition. Spanish translations are currently being published by Gredos (Madrid), in the Biblioteca clásica Gredos, and also by the Ediciones Clásicas (Madrid) in the Colección de Autores Griegos.

Abstract

One of the most famous scholars of his own time, Galileo Galilei made many contributions to astronomy, mathematics, mechanics, and philosophy, publishing widely and displaying a firm grasp of various Renaissance genres. Galileo aimed to advance mathematics as the discipline best suited to understanding nature and was part of the movement to revive Archimedean mathematics. His telescopic discoveries provided a new impulse to Copernicanism and the debate on heliocentrism. After the trial of 1633, in which the Catholic Church found him guilty of the vehement suspicion of heresy, Galileo published one more work on the sciences of materials and motion.

Biography

Galileo Galilei was born in Pisa in February 1564, to the musician and composer Vincenzo Galilei and Giulia Ammannati. He was the eldest of six children, four of whom survived childhood: Galileo, his brother Michelangelo – who followed in

Vincenzo's footsteps and became a lutenist – and his sisters Virginia and Livia. While never marrying his long-term partner Marina Gamba, Galileo fathered three children, naming them after his sisters and father: Virginia, Livia, and Vincenzo.

Not much is known about Galileo's early years. He studied Latin and other subjects with a teacher called Jacopo Borghini, to then gain further education at the monastery of the Vallombrosan Order near Florence, only to be called back to Pisa by his father in 1578. In 1580, he enrolled at the Pisan *studio* to study medicine. Here, he became acquainted with Aristotelian philosophy, through the lectures of Francesco Buonamici and Girolamo Borro. Each taught Aristotelian physics without following its subsequent interpretation and reworking by Thomas Aquinas, thereby going against the teachings set by the Council of Trent. While Galileo had enrolled at the university to study medicine, he had little interest in the subject and instead applied himself to mathematics, an interest most likely sparked by Ostilio Ricci, who also introduced him to the work of Archimedes. Galileo's father only reluctantly allowed his son to change subjects, having hoped that his son would choose a more lucrative profession (Heilbron 2010; Camerota 2004).

Galileo eventually left the university in 1585 without a degree and for several years explored a variety of topics that shaped his career and would continue to interest him throughout his life. He continued his work in (applied) mathematics, wrote poetry, and scribbled down his commentary on famous works of literature. He also learned how to draw, possibly at the new Accademia del Disegno. In 1589, Galileo obtained a teaching position at the University of Pisa, teaching Euclid and John of Sacrobosco to his mathematics students and astrology to students of medicine. During this period, Galileo further developed his thinking in mathematics as well as philosophy, influenced to some degree by Jacopo Mazzoni, who had joined the Pisan University in 1588 (Heilbron 2010). In 1592, Galileo was appointed the chair of mathematics at the University of Padua. Here, he – most likely – published a work on the comet of 1604 (Freedberg 2002),

which elicited a critical response from Lodovico delle Colombe, who would become an ardent opponent of Galileo's work later on (Biagioli 1993). Galileo supplemented his salary as a professor by offering private teaching and lodging, as well as by developing a mathematical instrument (the geometrical compass) he sold to students (Biagioli 2006). Galileo's dealings with the compass, and later with the telescope, are only two examples of his firm grasp of mathematical knowledge and artisanal practices (Valleriani 2010).

After almost two decades as a professor in Padua, news reached Galileo that a new instrument – one that made things that were far away seem nearby – had been invented in the Low Countries. While Galileo initially dismissed this as fake news, he soon changed his mind, potentially after hearing from his friend Paolo Sarpi. He quickly set to work and within months had developed a relatively high-quality instrument which he offered to the Venetian senate, earning him a pay raise and lifelong appointment to the Paduan university by September 1609 (Westfall 1985). The following January, Galileo aimed his instrument toward the sky, and after only a few months, he published the results of his observations in *Sidereus Nuncius*. The most important claims Galileo advanced in this work were that he had observed four stars orbiting around Jupiter, that the moon's surface was rough and mountainous rather than smooth, and that there were many more stars in the Milky Way than could be observed with the naked eye (Galilei 1610; Van Helden 2008). The work sparked the interest of scholars all over Europe, who fiercely debated its value – an activity complicated by the relative scarcity of telescopes of a sufficient quality. Eventually, however, Galileo's arguments were largely accepted, especially after the (partial) endorsement of the Jesuit scholars at the Collegio Romano, foremost among them Christopher Clavius (Van Helden 1994; Bucciantini et al. 2015). By that time, Galileo had already secured a position at the Florentine court, where Grand Duke Cosimo II granted him the title of First Mathematician and Philosopher, following

Galileo's explicit request (Westfall 1985; Biagioli 1993).

As part of his negotiations over his new position, Galileo had told the grand duke he was planning on publishing various major works. These would be concerned with matters of philosophy, astronomy, geometry, the theory of motion, and mechanics. Over the next decades, Galileo would indeed publish on this wide variety of subjects, using a similarly broad array of genres. Additionally, Galileo relied on the format of the semi-private letter to communicate his findings. Thus, in 1613, he wrote a long letter in which he expanded on his view on heliocentrism to his former student Benedetto Castelli. Galileo again used the format in 1615, this time addressing the Florentine Grand Duchess Dowager Christina of Lorraine (Finocchiaro 1989). The first letter especially circulated also beyond Galileo's personal circles and sparked the interest of various Dominican friars, some of whom took issue with its more outspoken standpoints and denounced Galileo to the Roman Inquisition (Mayer 2015). Following a long and complicated series of events, these complaints eventually led to the banning of Copernicus' work in 1616. In addition, Galileo was given a warning, privately delivered by Roberto Bellarmino, not to hold, teach, or discuss the heliocentric worldview (Finocchiaro 1989; Feldhay 1995).

In the following years, Galileo entered into a polemic regarding the nature of the comets with the Jesuit author Orazio Grassi, which led to two new works. The first of these was published under Galileo's student Mario Guiducci's name (Guiducci 1619); the second, *Il Saggiatore*, appeared under Galileo's own name (Galilei 1623). In this last work, Galileo argued that philosophy should not be approached through scholastic reasoning, but through mathematics. This was the language through which the "book of nature" could be read (Galilei 1623).

Galileo, in close collaboration with his fellow members of the Accademia dei Lincei, dedicated this work to the newly elected Pope Urban VIII (Maffeo Barberini). Galileo and Barberini had met on earlier occasions, and Galileo knew the new Pope to be sympathetic to his ideas. Sensing an

opportunity, during a trip to Rome in 1624, Galileo spoke with Urban VIII on the subject of heliocentrism. From this conversation, he drew the conclusion that the Pope would allow him to publish a work in which he discussed Copernicus' ideas, if hypothetically. While quickly setting to work, Galileo would only publish his findings in 1632, with the famous *Dialogo sopra i due massimi sistemi del mondo* (Galilei 1632). As the book made its way to Rome, however, it became clear that Galileo's "hypothetical" discussion of the heliocentric worldview left readers with little doubt as to his true opinions on the subject. Urban VIII ordered distribution of the book to be stopped and all books already sold to be confiscated and in August appointed a panel to investigate whether Galileo should be called before the Holy Office based on his writing. During this initial investigation, it was discovered that Galileo had been given an injunction in 1616 not to discuss, hold, or teach heliocentrism in any way, which only aggravated the accusations against him; it suggested that Galileo purposefully concealed this information from Urban VIII in order to manipulate him into allowing Galileo more freedom on the subject of heliocentrism (Heilbron 2010; Finocchiaro 1989).

Galileo was called to Rome and, on 22 June 1633, found guilty of vehement suspicion of heresy. Galileo abjured, and though the Inquisition absolved him of this specific crime, he was nonetheless punished: his work was prohibited, and he was sentenced to imprisonment and was soon confined to his villa in Arcetri as a form of house arrest. Moreover, to set an example and discourage others from similarly defying the Church's authority, the sentence dictating these measures was widely disseminated throughout Europe, aimed especially at philosophers and mathematicians. Finally, the punishment did not end with Galileo's death: in 1642, the Catholic Church prevented the construction of a funerary monument for Galileo in the Santa Croce church in Florence (Finocchiaro 1989, 2005; Galluzzi 2006).

From his villa in Arcetri, Galileo stayed in touch with scholars in and beyond Italy. His international contacts helped him publish his last work, *Discorsi e dimostrazioni matematiche*

intorno a due nuove scienze, with the Elzevier firm in Leiden (Galilei 1638; Raphael 2012). The work is concerned with four different aspects of physics, which are each discussed over the course of one fictional day spent with the same three interlocutors figuring in Galileo's *Dialogo*. Thus, on the first day, Simplicio, Salviati, and Sagredo discuss Aristotelian physics and mechanics; on the second day, they turn to materials; on the third day, they discuss uniform and naturally accelerated motion; and on the fourth, they discuss projectile motion (Heilbron 2010; Raphael 2017).

Galileo's letters from this period show him lamenting his fate and sharing his hope that his sentence might be lifted or alleviated. Such a change never came about. Galileo did – initially – find solace in the company of his daughters, who lived in a monastery nearby, although the passing of his favorite daughter in 1634 added to his suffering. Slowly turning blind, Galileo was assisted in his work and writing by various younger students who came to stay with him over time, among them Evangelista Torricelli, who would live with Galileo during his last 3 months and succeeded him as Mathematician to the grand duke after Galileo's death in 1642, and Vincenzo Viviani, who would play an instrumental role in collecting Galileo's letters and safeguarding his legacy.

Heritage and Rupture with the Tradition

In the last decades, Galileo's reputation as "father of modern science" has slowly but surely given way to a much more nuanced view on the scholar. In this view, Galileo is no longer seen as simply breaking with the scholarly traditions of his time but as shaped by and indebted to them. Galileo had a firm interest in humanist debates and was very much at home in discussions about Italian literature; he knew how to draw and corresponded not only with other natural philosophers but also with poets and artists (male and female), offering advice and help when possible (Galilei 1929–1939; Reeves 1997; Hall 2013; Ray 2016).

As a student in Pisa, Galileo had been schooled in Aristotelian philosophy while also being introduced to Archimedean mathematics. He tried to show that mathematical knowledge not only was helpful in an abstract, theoretical way but also yielded real insights into the nature of things: the domain of philosophy. Combining mathematical theory and practical experiments, in his 1612 work *On Floating Bodies*, Galileo published some of the views he had developed in discussions with various opponents who staunchly defended Aristotelian philosophy. The discussions had taken place earlier, at dinner table discussions and during follow-up meetings, and had revolved around the question why some bodies – for instance, a slab of ice – float atop of water while others sink. Galileo took issue with his opponents' Aristotelian point of view, which held that the shape of objects was crucial to their capacity to float or sink in water, as well as with the idea that ice must have greater density than water. Galileo instead relied on Archimedean principles and argued that ice has a lower density than water, as it is rarefied water, and floats for that reason (Galilei 1612).

The episode is important for two reasons. First, Galileo battled various opponents and eventually proposed they solved the matter through experiments – displaying Galileo's appreciation for experiments as a way to explore and explain the laws of nature. However, it also becomes clear that the role of experiments in Galileo's thinking was complicated. Galileo's most important opponent Lodovico delle Colombe met Galileo's challenge with an experiment that contradicted his arguments and confirmed traditional Aristotelian doctrine: he showed that a chip of ebony floats, while a ball of the same material sinks. Galileo tried to worm his way out of this predicament by claiming the real question was whether the chip would also float when wetted first. Second, when he subsequently published his views, he used the opportunity to launch a defense of his particular mathematical-philosophical approach. Here, Galileo built on an already existing tradition of Archimedean mathematics – having by no means been the first to rediscover the ancient mathematician. Yet in doing so, he took Archimedean abstract

mathematical principles into the realm of reality, arguing that mathematical reasoning could furnish knowledge about the real world: Galileo's contribution lay in trying to combine theory with experiments and mathematics with philosophy (Biagioli 1993; Cohen 2010).

Innovative and Original Aspects

Among the most innovative aspects of Galileo's work are his application of the telescope to the heavens, his insistence that mathematics provides real insights into the nature of things, and his work on the laws of motion. With regard to the telescope, Galileo's achievement lies not in the field of theoretical optics but rather in his new and pioneering work with the instrument. Galileo was among the first to turn the new instrument toward the heavens, but it is important to stress that he was not unique in doing so. The Englishman Thomas Harriot and the German Simon Mayr both did so around the same time, with Harriot observing and drawing the moon several months before Galileo did. Galileo's discovery of Jupiter's satellites, which he then named the Medicean stars, was matched almost to the precise date by the German astronomer and mathematician Simon Mayr (Pumfrey 2009; Pasachoff 2015).

Galileo's quick publication of his findings, however, ensured that his name became linked to the new celestial findings. It also gave the ongoing debate on heliocentrism a new impulse. His findings on the moon's rough surface undermined the firm distinction Aristotelian philosophers drew between the perfect heavenly bodies on the one hand and the imperfect, muddy earth on the other. Galileo's understanding of the effect painters called "secondary light" as relevant to the heavenly bodies similarly underlined the relevance of his discoveries for the heliocentric theory. The concept of secondary light was used to describe situations where a bright light hits a surface and is, from that surface, reflected onto another surface. Galileo applied this reasoning to the heavenly bodies, claiming that the earth's surface, under specific circumstances, reflected the light from the sun onto the moon. Again, this argument

threatened the conceptualization of the heavenly bodies and the earth as firmly distinct, as it turned over the idea that the moon was lighter, brighter, and less rugged than the earth (Reeves 1997). These threats to traditional Aristotelian philosophy were only further aggravated by Galileo's description of the Medicean stars – the satellites orbiting Jupiter. If Jupiter had moons, one of the arguments most frequently used against a moving earth – namely, that the moon would, surely, not be able to follow its path – became impossible to maintain. While Galileo in his *Sidereus Nuncius* did not explicitly comment on the importance of his discoveries for the heliocentric debate, most contemporaries quickly grasped their relevance. Copernicus' work had been a theoretical, mathematical exercise that offered a simpler model than the Ptolemaic one, without proving that system to be wrong. Galileo now presented the world with real phenomena that undermined the Aristotelian dichotomy between heaven and earth. It comes as no surprise, then, that very few were immediately willing to accept Galileo's findings (Van Helden 1994, 2008; Westman 2011).

Galileo's own attitude toward heliocentrism is exemplary for the way he often behaved regarding matters of innovation. In 1597, he had told Johannes Kepler that he was a Copernican but then failed to meet Kepler's appeal to openly speak out in favor of the heliocentric theory (Westman 2011). In the *Sidereus Nuncius*, he again avoided taking a direct stance. Only later on, in the *Letters on Sunspots* (a collection of letters addressed to the Jesuit scholar Christoph Scheiner and published in 1613), did he openly – and vehemently – take position in the debate. In this work, he presented his observations on the spots on the sun's surface, thus casting further doubt on the Aristotelian claim that the heavenly bodies – and most of all the sun – were perfect and unblemished. Furthermore, the work also relayed Galileo's findings on the phases of Venus, which indicated that the planet moved around the sun rather than the earth (Galilei 1613; Galilei and Scheiner 2010). As outlined above, in the years immediately following the *Letters on Sunspots*, he also defended heliocentrism via other means, pushing – and failing – to have it

accepted by the Catholic Church. It is one example of a broader pattern: Galileo was not necessarily quick to publicly embrace new ideas, but when he did so, he did it with passion (and a hint of aggression) – and he was always quick to ridicule those who were slower than he had been.

Impact and Legacy

Historians have often called Galileo's last work, *Discorsi e dimostrazioni matematiche intorno a due nuove scienze*, his most important. They argue that this work, concerned mostly with the “two sciences” of materials and motion, offers the most thorough and detailed discussion of Galileo's views on nature and the methods best suited to study it. Furthermore, they claim this work had the most direct impact on the work of subsequent scholars, among them René Descartes, Christiaan Huygens, and Isaac Newton. Many readers, however, did not approach the work in the same fashion as these figureheads of modern science. Instead, they read it “eclectically,” seeking to reconcile aspects of Galileo's thinking with aspects of Aristotelianism. In this way, Galileo's work became part of the long tradition of Aristotelianism he often sought to oppose (Raphael 2017).

Work in astronomy continued to be carried out in Italy as well as abroad: Giovanni Domenico Cassini and Christiaan Huygens each made crucial discoveries on Saturn's rings, which Galileo had observed in 1610 but could not yet identify as such (Van Helden 1994). Various students of Galileo would continue to work on issues that had interested him, both in applied and in theoretical mathematics. Thus, Benedetto Castelli, Evangelista Torricelli, and Vincenzo Viviani contributed to scholarship by publishing on issues of geometry, physics, optics, and hydraulics, and the latter two each followed into Galileo's footsteps as Florentine court mathematicians. Renewed attention to their work has contradicted the long-held conviction that Italian science came to a standstill with Galileo's trial and subsequent death. Galileo's last students, and Viviani in particular, also played a crucial role in the safeguarding his posthumous glory,

collecting Galileo's letters, pushing for an edition of his collected works, and erecting monuments in his honor (Segre 1991; Galluzzi 2006).

Gans, David

Born: 1541, Lippstadt

Died: 1613, Prague

Tamás Visi

Kurt and Ursula Schubert Centre for Jewish Studies, Univerzita Palackého v Olomouci (Palacky University), Olomouc, Czech Republic

Abstract

David Gans (1541, Lippstadt – 1613 Prague) was an Ashkenazi Jewish polyhistor active chiefly in Prague at the turn of the sixteenth and seventeenth centuries. He is known first and foremost as the author of two books: (1) *Tsemah David*, a Hebrew chronicle describing Jewish history and general history from the

beginnings to the author's days (published in Prague, 1592), and (2) *Nehmad va-na'im* a manual of astronomy based on the Ptolemaic system but quoting some of the opinions of Nicholas Copernicus, Johannes Kepler, and Tycho Brahe (published in Jessnitz, 1743).

Gans was not a cutting-edge historian such as his Italian Jewish contemporary, Azariah de' Rossi, who questioned the historicity of some post-biblical Jewish legends. Neither was he a cutting-edge astronomer as Kepler, who advanced the heliocentric model of the universe. Gans endorsed conservative, traditionalist positions in historical and astronomical questions. Nevertheless, his works were important cultural innovations within the context of early modern Ashkenazi Jewish culture. His books on historiography and astronomy enriched the Ashkenazi Jewish cultural repertoire by introducing subject matters to the Jewish public which were usually ignored in Ashkenazi tradition. Therefore, some scholars consider Gans as a forerunner of modern Jewish culture that began to emerge during the second half of the eighteenth century.

Biography

David ben Shlomo Gans was born in Lippstadt, Westphalia, in 1541. He received education in traditional, religious sciences in Bonn, Frankfurt a. M. and later in Krakow. Natural sciences and philosophy were usually not taught in Jewish schools during this period; nevertheless, Gans studied Euclid's *Elements* on the basis of a medieval Hebrew version of that work which he found in a manuscript in the city of Nordheim (Germany). In Krakow, Gans studied at the yeshiva (religious academy) of Moses Isserles, one of the greatest rabbis of the age. Unlike most Ashkenazi rabbis, Isserles valued scientific knowledge, and he composed some (not very significant) scientific works. It is likely that Isserles encouraged Gans's interest in natural sciences (Neher 1986). Around 1564, Gans moved to Prague, where he became a disciple of R. Judah Löw ben Betsalel, the famous "Maharal of

Prague.” Mordecai Maisel, the leader of Prague Jewry, may have been Gans’ patron around 1592 when he published his first book, *Tsemah David* (Greenblatt 2014). Around 1600, Gans spent few days with Johannes Kepler, Johannes Müller, and Tycho Brahe in the latter’s observatory in Benatek (Benátky nad Jizerou) near Prague. He published a short astronomical treatise entitled *Magen David* in 1612. David Gans passed away on 22 August 1613 in Prague.

Works I: *Tsemah David*

Gans’s most influential work is a Hebrew chronicle entitled *Tsemah David* [also spelled *Zemah David*, *Tzemach David*, Hebrew “Branch of David” cf. Jeremiah 23:5] and printed first in Prague, 1592 (and many more times afterwards). Historiography was not a prestigious literary genre in premodern Jewish culture; in fact, very few historical works had been written by Jews since antiquity (Yerushalmi 1982). This situation changed slightly during the sixteenth century, when a dozen of historical texts, mostly by Sephardi Jews, were written and published. Gans’s chronicle is an exceptional, Ashkenazi instance of the same intellectual trend. It is debated how far Gans’s enterprise was connected to Sephardic precedents (Yerushalmi 1982; Breuer 1983b; Bonfil 1988).

It has been suggested that *Tsemah David* was intended as a response to an Italian Jewish humanist, Azariah de’ Rossi (Breuer 1983b). De’ Rossi wrote a Hebrew book entitled *Me’or ‘enayim* (1575) which critically reassessed ancient Jewish legends (*aggadot*) on the basis of non-Jewish sources (Weinberg 1982, 2001; Veltri 2009). De’ Rossi’s work was heavily criticized by Maharal of Prague (Ruderman 1995; Veltri 2009); perhaps, Gans’s intention was to support Maharal’s criticism by providing a traditionalist narrative of Jewish history (Breuer 1983b). Other scholars underline the specific intellectual and cultural milieu of Rudolphine Prague that encouraged Gans’ endeavor (Greenblatt 2014).

In Gans’s perception, historiography was first and foremost chronography, a discipline of describing and measuring time, and as such it

was closely related to astronomy. Accordingly, Gans’ chronicle offers a chronological outline of the past rather than a continuous narrative of human history. In the introduction of *Tsemah David*, Gans emphasizes that the work was intended for a wide, laic, and uneducated readership. The chronicle itself is divided into two parts: one of them treats general history, whereas the other focuses on events and persons that were especially important for Jews. Since similar divisions between “sacred” and “profane” histories appear in contemporary Christian historical works as well, it has been suggested that the structure of *Tsemah David* may have been inspired by Christian historiography (Greenblatt 2014).

Both parts are organized as long series of brief entries each recording the major events of a single year. The entries are arranged in a linear chronological sequence from the creation of the world to Gans’s own time. Gans’s scientific curiosity is evidenced by his occasional inclusion of scientific materials at the beginning of the book, where the creation of the world is discussed, and at some other places, e.g., an account of a comet that was visible in 1572. Remarkable is the entry on the invention of print which Gans praised enthusiastically. The prominence of Prague-related material in the content of both parts of the chronicle is also conspicuous. *Tsemah David* probably preserves some of the oral histories of Jews living in Prague (Greenblatt 2014).

A critical edition of the Hebrew original has been published by Mordecai Breuer (1983a); an English translation of the work and a study identifying Gans’ sources is under way (Šedinová et al. in preparation). A later edition of *Tsemah David* (Frankfurt a. M., 1692) includes an additional part on historical events from 1592 to 1692. The work has been translated to Yiddish and Latin (see Steinschneider 1852–60, no. 4805/3–8).

Works II: *Nehmad ve-na’im*

A second important work by Gans is a manual of astronomy and related sciences entitled *Nehmad va-na’im*. It includes a section on cosmology, a section on the structure of the celestial spheres, a

section on geography, a section on the measurement of time, and several sections on the movement of the Zodiac, the Sun, and the Moon (Alter 2011 [1958]; cf. Freudenthal 2011). The text is accompanied with illustrations and tables containing geographical and astronomical data.

Gans must have begun writing this book before December 1596 when a scribe copied an early version of it (see below, next section). At this time, the book bore the title *Magen David*, and thus it has often been confused with a later work bearing the same title. Most of the book had been finished by 1600; further sections were added to it in 1610 and 1613 (Alter 2011 [1958]).

The cosmological lore included in the work is based on medieval Jewish Aristotelian and Neoplatonic texts. Gans complains in the book that he was unable to access important medieval Hebrew astronomical texts by Abraham Ibn Ezra (1091/2–1167) and Levi ben Gershon (Gersonides 1288–1344). In astronomy, Gans follows the Ptolemaic model despite the fact that he was personally acquainted with Tycho Brahe and Johannes Kepler. It has been suggested that Kepler developed his heliocentric model only after Gans finished his work and thus the former could not influence the latter (Neher 1977). Nevertheless, *Nehmad va-na'im* includes reports about Gans's conversations with Brahe, Kepler, and Müller and about their work at the observatory (Alter 2011 [1958]).

The book was printed for the first time as late as 1743 in Jessnitz by R. Joel b. Jekutiel Sachs, rabbi of Austerlitz in Moravia. It also circulated in manuscripts among few Jewish intellectuals, who formed a “scientific subculture” among Ashkenazi Jews during the seventeenth and eighteenth centuries. The printing of Gans's astronomical manual in 1743 is considered an event of some significance in Jewish intellectual history: it was a sign of an increasing interest in sciences and rationalism, a step toward *Haskalah*, a specific Jewish version of enlightenment that was to come during the second half of the eighteenth century (Freudenthal 2007). A critical edition and an in-depth study of *Nehmad ve-na'im* is a desideratum. (For an annotated edition of the introduction, consult Bolag 2008.)

Other Works

In *Nehmad va-na'im*, Gans mentions other scientific works on astronomy, geography, mathematics, geometry, and the Jewish calendar he wrote or planned to write. Only one of them seems to have survived: *Magen David* (Hebrew, “The Shield of David”) is a short introduction to astronomy. It was printed in Prague in 1612; a unique copy has been preserved in the Bodleian Library in Oxford (cf. Steinschneider 1852–60, no. 4805/1). In the introduction, Gans mentions two pupils, one of them being his son, who demanded him to write a book on astronomy. It has been suggested that Gans published this work, because he failed to raise money for the publication of *Nehmad va-na'im* (Neher 1977). *Magen David* is the first printed Hebrew text mentioning Copernicus and summarizing his theory (Neher 1977).

Another astronomical work also entitled *Magen David* but different from the previous one is attested in a manuscript which a scribe copied on 6–9 December 1596 in Bishitz (Byšice, Czech Republic, near Prague) (Hamburg, Staats- und Universitätsbibliothek, Cod. Hebr. 273; cf. Steinschneider 1878, no. 299; note that the Hebrew date of the manuscript is converted incorrectly in Steinschneider's catalogue). This work seems to be an early version of *Nehmad va-na'im* (cf. Alter 2011 [1958]).

An early modern bibliographer mentions a geographical book entitled *Tsurat ha-arets* (Hebrew: “The forms of the earth”) by David Gans which was supposedly published in Istanbul. No copy of this work is known to have survived (see Steinschneider 1852–60, no. 4805/1 and no. 4965/3).

Gardens, Botanical

Simone Kaiser

Abt. Kunst und Kulturgeschichte, Hessisches Landesmuseum Darmstadt, Darmstadt, Germany

Abstract

A botanical garden (BG), also called botanic garden, is an institution and a piece of land marked off for the cultivation of a systematically ordered collection of living plants. It serves purposes of scientific research, conservation, display, enjoyment, and education. Gardens dedicated specifically to the study of plants go back to antiquity. Nevertheless, the emergence of the BG type as an institution is a Renaissance phenomenon closely linked to the gradual development of the science of botany into a discipline independent from medicine. First BGs as such were founded in association with medical schools of European universities in the sixteenth century. Professors of medicine and apothecaries were the proto-botanists of that time, i.e., specialists of medicinal plants. Being rooted in the humanist culture of the Renaissance demanded new forms of investigating nature and teaching knowledge on plants with the result that gardens increasingly began to serve as additional open-air studies. There species could be directly observed and compared respectively to traditional codified knowledge. A growing number of herb books, collections of plant illustrations, and the invention of the *herbarium* in form of a collection of dried plants accompany this

development and reflect the growing range of specimens cultivated in BG. The scientific approach in ordering these living, dried, and illustrated botanical collections had great impact on the history of botany. It led to a change of interest in plants, studied no longer exclusively for their healing properties but as an independent subject matter. Europe's colonial history bringing more and more new species to the attention of pioneering botanists is another decisive factor for this change. In the seventeenth century, the main interest shifted definitely from medicinal plants to new exotic plant imports. These came first in form of diplomatic gifts from distant empires or as trophies from the European colonies. Parts of princely gardens also displaying botanical collections had often been among the first to display such novelties. Early botanists maintained extensive networks for the exchange of plants to amplify their collections. Along with the increasing success in cultivating foreign species in European climates masses of new material entered BG via laborious collecting expeditions.

Origins

The precursor of the botanical garden (BG) is the medieval medicinal garden, called herb garden or physic garden or garden of simples. "Simples" was used as another word for herbs in medieval and early modern times because herbs constituted the simplest ingredients of medicinal compositions (*remediae compositae*) mixed by apothecaries and physicians. In the Middle Ages, monasteries contained gardens with collections of medicinal herbs and preserved ancient botanical knowledge. Since the fourteenth century, also universities kept such gardens for the use of pharmacists. Herbal manuscripts of antiquity were the most influential reference works on botanical questions. Besides the writings of the Greek physician Galen (second century AD), the *De Materia Medica* of the Roman physician Dioscorides (first century AD), a description of physical and remedial properties of plants written in Greek,

remained the most authoritative book on botany until the seventeenth century. Although the monastic orders in Medieval Europe mainly perpetuated Dioscorides-based knowledge, a change of value in reference to plants and a desire for their observation becomes palpable in the thirteenth century, e.g., with regard to the writings of the Dominican friar and natural philosopher Albertus Magnus (1193/1206–1280). In particular, Arabic physicians made progress in botanic matters. The Andalusian Ibn al-Baytar, (1179–1248) e.g., based his writings on *Materia Medica* not only on Dioscorides and Galen but also on his personal observations of ca. 1,400 plants. Furthermore, Andalusian (Muslim) Spain had ever since been a forerunner in experimenting with the cultivation of exotic plants. When Christian Spain finally reconquered al-Andalus toward the end of the fifteenth century its gardens became famous and better known among the growing number of villa enthusiasts. This may have influenced the gardens and gardening of these humanists in various ways. A renewal of horticulture had followed Pietro de' Crescenzi's (~1230/35–1320) pivotal treatise on agriculture, the *Liber Ruralium Commodorum* (1304–1309), and intensified during the revival of ancient villa culture based on literary knowledge of antiquity in the fifteenth century. The central stage of this movement and cradle of the first BG was the Apennine Peninsula. Gardens of simples were often included within (Italian) Renaissance villa gardens. Princes, physicians, and pharmacists alike became ardent collectors of traditional herbs and new foreign plants in the sixteenth century. In the early founding period of BG, when medicine, pharmacy, and botany were not distinct disciplines yet, there is no clear notional distinction between evolving types of gardens. Thus, BGs were labeled by various names, among others *hortus medicus*, *hortus botanicus*, or *hortus academicus*.

Early Examples

The first BGs were those established in Padua and in Pisa in the early 1540s. Plant identification had then become a pending problem due to conflicting

opinions on translating Dioscorides and finding the matching species. At the University of Padua, Francesco Bonafede (1447–1558) had instituted a chair of simples (*lectura simplicium*) in 1533. At the end of the year 1543, he pleaded for the establishment of an associated garden. The Venetian republic supported the proposal, and the desired didactic garden of simples arose in 1545. From then on direct observation of living plants (*ostensio simplicium*) complemented the botanical lessons. Soon exotic species also entered the garden thanks to the Venetian trade relations with the Eastern Mediterranean, and Padua became an important center for the study of botany. The engraver Girolamo Porro published the first guidebook to this BG for the use of students in 1591 (*L'Horto dei semplici di Padova*, including a ground plan, Fig. 1). In Pisa, the Medici princes patronized the development of botanical studies. In 1543, Grand Duke Cosimo I de' Medici (1519–1574) invited Luca Ghini (1490–1556), a

naturalist, herbalist, and physician from Bologna, to give lectures on simples in Pisa. Ghini had just invented a new method for studying simples by starting the first collection of pressed dried plants (*hortus siccus*) in 1540. He could use a garden near the Arsenal for teaching his students in Pisa since 1544. Ghini also chose plantings for another BG that Cosimo I instituted in Florence in 1545. His pupil Andrea Cesalpino (1525–1603) succeeded him in Pisa relocating the BG to the east of town in 1563, but the site proved unsuitable as well. Ferdinand I entrusted Lorenzo Mazzanga, probably a pupil of Cesalpino, and then the Fleming Joseph Goedenhuize (1535–1595), alias Giuseppe Casabona, to create the third and remaining BG next to Pisa's baptistery from 1591 to 1595. Michelangelo Tilli, director of the BG of Pisa since 1683, published an extensive catalogue on the plants cultivated there in 1723 (*Catalogus plantarum horti Pisani*, including a map of the garden, Fig. 2).

In the later sixteenth century and first half of the seventeenth century followed important new establishments of BG in Bologna, Leiden, Leipzig, Heidelberg, Basel, Montpellier, Oxford, and Paris. In Bologna, Ghini had already wanted to institute a BG. One of his pupils, the influential natural scientist and philosopher Ulisse Aldrovandi (1522–1605), finally realized this idea in 1568. The curators of Leiden University founded the oldest BG in the Netherlands, the *Hortus Academicus Lugduno-Batavus*. Charles de l'Écluse, called Carolus Clusius (1526–1609), the leading botanist of his generation, became its scientific director. Arriving in 1593, he set up the BG of Leiden with the help of Dirck Outgaertsz Cluyt (1546–1598), its first gardener. Clusius

maintained one of the biggest networks for plant exchange and brought with him a large tulip collection becoming the base of the tulip trade in the Netherlands. A first catalogue of this BG appeared as early as 1601 under the direction of the physician and botanist Peter Pauw (1564–1617) heading the management together with Bontius since 1598 (*Hortus Publicus Academiae Lugduno-Bataviae*, including a map of the garden, Fig. 3). German humanist centers had become, after Gutenberg's invention of printing around 1455, important places for the diffusion of early illustrated botanical treatises like Konrad von Megenburg's *Puch der Natur* (Augsburg, 1475), the *Hortus Sanitatis* (Mayence, 1491), or Otto Brunfels' *Herbarium vive eicones* (Strasburg, 1536). BGs comparable to the Italian models, however, came into being only in the later sixteenth century. In Leipzig, Moritz of Saxony (1521–1553) reassigned a secularized monastery garden to the university for didactic purposes as early as 1543, but a proper BG was probably only installed when the mathematician Moritz Steinmetz became the first lecturer of botany in 1580. The University of Heidelberg obtained its first BG thanks to the professor of medicine Henrich Smet (1535/37–1614) in 1593. The eminent physician and natural scientist Conrad Gessner (1516–1565) created a *hortus medicus* in his hometown Zürich in 1556, not continued after his death though. The earliest BG of Switzerland became then the one instituted by Caspar Bauhin (1560–1624) at the University of Basel in 1589. France's oldest BG is the one in Montpellier. Well-known naturalists like Clusius and Lobelius (Matthias de l'Obel) had studied at the University of Montpellier under the popular teacher Guillaume Rondelet (1507–1566) who had a special interest in botany and zoology. A BG following the model of Padua came into being only in 1593 under the surveillance of Pierre Richer de Belleval (1564–1632), professor of botany and anatomy. It inspired the *Jardin du Roi* (later called *Jardin des Plantes*) in Paris. Guy de la Brosse, botanist and physician to King Louis XIII, achieved to found the latter in 1626; it did not open to the public before 1640 though. The royal herbalist Jean Robin (1550–1629) had designed an earlier BG on the

Île de la Cité for the faculty of medicine in 1597. In England, Henry Danvers (1573–1643), later Earl of Danby, patronized the construction of the first BG for the University of Oxford. Founded in 1621, its first prefect became the German botanist Jacob Bobart (1599–1680).

Ordering Structures

Renaissance gardens, especially in the sixteenth century, generally constitute an intricate interplay between art, science, and nature, a complex conceptual system often combining various functions or even types of gardens in metastructures (e.g., villas). In contrast to pleasure gardens or kitchen gardens, the main function of the BG was the study of botany. Therefore, practical and scientific aspects prevailed in designing this type of garden. The basic form used in the Renaissance for BG is that of the quadripartite quadrangle: The space divides into four sectors by two main paths crossing each other. Familiar models of this basic structure are the medieval cloister garden or also

ancient Roman military camps and cities. In addition, the idea of the *chahar bagh*, the “four garden” form in Islamic culture, may have been another factor for adopting the quadripartite quadrangle in the Renaissance BG. Smaller planting units subdivided each sector of the basic square. Margins (of stone or wood) had to surround the compartments because the species needed clear separation. The partitioning of planting beds should rationally display the classification of botanical species so that the students could investigate inherent similarities and differences. In use were simple rectangular beds, e.g., at the BG of Leiden (Figs. 3 and 4), but also complex geometrical patterns, e.g., at the BG of Padua and Pisa (Figs. 1 and 2). Simple rectangular beds had already structured the medieval herb garden as documented in the monastery plan of St. Gall (ninth century). Geometric patterns for flowerbeds appear first in illustrations of Francesco Colonna’s *Hypnerotomachia Poliphili* (1499) and in Sebastiano Serlio’s books on architecture (1537); Islamic sources may have inspired them as well. The design of Padua’s BG, devised

Gardens, Botanical,

by the Venetian humanist and architectural connoisseur Daniele Barbaro (1513–1570), was an influential role model. Its unique feature is the circular shape of its surrounding wall, putting the usual quadripartite quadrangle within. Handbooks on designs of planting compartments became soon common. When Goedenhuize became director of the third BG in Pisa he used, e.g., such a handbook for the layout of geometrical patterns for the eight squares of his garden (*Libro di compartimenti di giardini di Giuseppe Benincasa*, ms. 464, University Library of Pisa). Circular or octagonal fountains, often situated in the center of a main square, facilitated irrigation.

In addition to the functional aspects, these layouts transported also symbolic significance illustrating the analogical connection of the four elements, the planetary constellations, and the temperaments of the human body. The encyclopedic collecting activity of botanists also stands in the salvific context of naming and classifying God's creation in an attempt to repatriate paradise. In terms of plant classification, early botanists experimented with various possibilities before the binominal nomenclature of Carl Linné (mid-eighteenth century) asserted itself. The associated *herbaria* of BG were important scientific instruments for comparing the affinities and

differences of species and thus establishing order in the plant world. Cesalpino as well as the Bauhin brothers, e.g., made innovative contributions in that respect. Cesalpino stopped grouping plants according to their healing properties and focused on their seeds and fruits instead. Gaspard Bauhin listed 6,000 plants in his *Pinax theatric botanici* (1623) and classified them in genera and species. Printed plant catalogues for the orientation of students document the didactic display of order in the living collections, giving a list of species and their exact location in the garden (e.g., in Leiden). In the BG of Padua, the geographical origin of species seems to have played a role for their display (according to Girolamo Porro's description of 1591).

Vital parts of the structure of early modern BG were also cabinets of curiosities, the precursors of natural history museums. Pisa had a "galleria" with a large natural history collection that attracted many tourists. It displayed cabinets ordered after the proposals of the German physician Samuel Quiccheberg (1529–1567), who wrote the first treatise on museology (*Inscriptiones vel Tituli Theatri Amplissimi*) in 1565 inspired by the ideas of Giulio Camillo Delminio. Glasshouses became common only in the seventeenth century. The first glass house was

supposedly that of the BG in Leiden built in 1599–1600. This prototype still comprised the natural history collection and thus functioned as cabinet of curiosities as well.

Plants

At the end of the fifteenth century, there were around 1,000 different plant species known and cultivated in European gardens, mostly varieties native to the continent. Some exotic species were familiar through travelogues (e.g., of Marco Polo). Thanks to the progress in navigation and the stabilization of routing, the interest in acclimatizing plants from extra-European expeditions started to grow. Among the first to experiment on acclimatizing exotic plants were rich families like the Medici in Florence who tried to cultivate potatoes, mulberry, and pineapple in their gardens as early as the end of the fifteenth century. However, the early founding phase of BG still classifies as “European” with regard to the history of plant imports. Until the mid-sixteenth century, the plant collections consisted almost exclusively of specimens that were already native in Europe at that time, medicinal plants in focus. Important was the cultivation and diffusion of Mediterranean species like lily, peony, laurel, oleander, as well as citrus plants. The following period from 1560 to 1620 is characterized “oriental phase” for the enormous amount of plant influx from the Levant. Notably varieties of tulips, narcissi, hyacinths, lilies, and anemones came via the Apennine peninsula to Europe. Imperial ambassadors at the Sublime Porte in Istanbul played a significant role for bringing about the transfer of plant material. Ogier Ghiselin de Busbecq (1522–1592) provided, e.g., the first tulip for the Occident. Imports from South America entered Europe via the botanical gardens of Spain. Of particular historical significance would be economic plants like corn, potato, sunflower, and tobacco. North American plant imports became dominant in the “Canadian phase” after 1620 and were at that time mostly diffused via the *Jardin du Roi* in Paris. Around the mid-seventeenth century, the development of heating techniques for hibernation

architecture would give way to future South African plant imports from the Dutch colonies via the botanical gardens of Leiden and Amsterdam.

Gardens, Ethics

Simone Kaiser

Abt. Kunst und Kulturgeschichte, Hessisches Landesmuseum Darmstadt, Darmstadt, Germany

Abstract

Gardens were favorite places for discussing ethical problems concerning the relationship of nature and man in the Renaissance. What is more, moral-philosophical aspects accompanied the very idea of the garden. Gardens were supposed to reflect an image of the world, the view of the world as conceived by its creator,

and thus their order shed light on the virtues and character of the latter. The ethical dimension of gardens is closely related to their emblematic identification with paradise found expressed in literature, the visual arts and garden architecture alike. Moral meaning applied to gardens increased according to the growing importance of their representational and didactic function tended to increase.

Tradition

Whereas the idea of paradise in Islamic culture is one of pure pleasure, the Christian tradition connects the earthly paradise, the Garden of Eden, also with the Fall of Man. The latter concept had tremendous influence on the moral perception of Western garden culture. In medieval Europe, the cloister garden developed as a place for contemplation on moral life and metaphysical questions. Its symbolic representation of the earthly paradise refers to the heavenly paradise that may be regained through the grace of God. Therefore, the garden also became an emblematic attribute of the Virgin Mary for her giving birth to Christ whose sacrifice redeemed the original sin. In monastic literature, the garden appears furthermore as a metaphor of the human soul fighting the battle of Virtues and Vices. Garden allegories emerged in profane literature as well. The French poem *Roman de la Rose* (~1230–1275) of Guillaume de Lorris and Jean de Meung, an allegorical dream vision of love set in a garden, exerted great influence on the imagination of the secular garden as a place for the development of the soul and the quest for happiness. It was highly popular in the Renaissance preceding allegorical poems like Francesco Colonna's *Hypnerotomachia Poliphili* (1499), Ludovico Ariosto's *Orlando Furioso* (1516–1532), and Torquato Tasso's *Gerusalemme liberata* (1575), which cross-fertilized also the creation of actual gardens.

Innovative and Original Aspects

An important innovative element changing the appearance and use of gardens is constituted by

the reference to the ethics of classical antiquity and their combination with Christian teleology. Reviving the ancient ideal of a simple life in the country and following the example of Plato's and Cicero's academies, humanists – the vanguard Francesco Petrarca (1304–1374) and the Neoplatonist Marsilio Ficino (1433–1499) among the first – fashioned the villa garden as the place *par excellence* for philosophical debate. It was appreciated, in a stoic perspective, for offering peace of mind in contemplation of the fortunes of life – a subject treated in form of villa dialogues, the most notable examples of which are Taegio's *La Villa. Dialogo* (1559) and Gallo's *Vinti Giornate* (1572, preceded by several shorter versions since 1550). Villa idealists of the sixteenth century like Bartolomeo Taegio (~1520–1573) and Agostino Gallo (1499–1570) merged ancient and Christian moral examples to legitimize their growing enthusiasm for the useful pleasures of the garden. Garden laws and moralizing inscriptions henceforth often expressed the humanist attitude of a villa garden's patron. The notion of choice and free will, with regard to the narrative of the Fall of Man as well as to ancient philosophy, became central to the perception of the self in the Renaissance. The associated salvific idea of the repatriation of paradise marked the humanist endeavor of collecting, cultivating, and ordering the world. New garden designs started to reflect these concepts, for example, by integrating labyrinths that offered a choice of paths or by staging the rhetoric of transforming wilderness into civilization. In particular, the rediscovery of the *Tablet of Cebes*, a Socratic philosopher's moral allegory of human life and the path to virtue, influenced the imagination and creation of gardens in the second half of the sixteenth century, popularizing temples of virtue and wisdom.

Impact and Legacy

The academic villa idealism, legitimized by moral-philosophical exaltation, spreads from Italy across Europe promoting gardens as places of *otium philosophicum*, self-improvement, and education. At first reserved to elitist circles of humanist scholars, gardens were increasingly

opened to the public. Particularly during the Reformation and Counter-Reformation, the didactic impetus and moral meaning of gardens gained in importance. New garden designs became subject of elaborate philosophical interpretation as proves, for example, Francesco de Vieri's exegesis of the Medici garden in Pratolino (*Delle Maravigliose Opere*, 1587). They could also invite to demonstrate one's confession as support, for instance, the descriptions of ideal gardens in Erasmus' *Convivium religiosum* (1522) and Bernard Palissy's *Recepte veritable* (1563). The relationship of man and nature changed profoundly from 1300 to 1650: from an increasingly sensual attitude toward nature via the ethos of improvement to the demonstration of man's dominion over nature.

Garin, Eugenio

Born: 1909, Rieti

Died: 2004, Florence

Francesco Borghesi
University of Sydney, Sydney, NSW, Australia

Abstract

Eugenio Garin has been one of the most well-known historians of Renaissance philosophy and culture and among Italy's most celebrated intellectuals in the second half of the twentieth century. After teaching for a quarter century at the University of Florence, he transferred to the Scuola Normale Superiore in Pisa, where he ended his academic career. His bibliography includes thousands of publications on topics ranging from history of

philosophy to medieval and Renaissance intellectual history and from philosophical historiography to history of intellectuals and of scientific culture in the twentieth century.

Biography

Eugenio Garin was an Italian intellectual and philosopher and an historian of Renaissance culture. Before becoming Italy's most celebrated historian of Renaissance culture and one of its foremost intellectuals, he was born in Rieti, in 1909, the son of a high school teacher and Greek philology specialist who died in 1920, when he was not yet 40 years old. Because of his father's premature death, Garin's adolescence was not easy, and he was forced to assume serious responsibilities for his family from a very young age. Although most of Garin's own education took place under the aegis of Giovanni Gentile's Fascist *Ministero della Pubblica Istruzione*, the intellectual climate of Italy during his youth was dominated by Benedetto Croce's version of Hegelian idealism.

Garin, who was to become closely connected with both Croce (1866–1952) and Gentile (1875–1944), resolved early on being both anti-idealist and anti-fascist. In later years, he commented on this decision stating that during the Fascist years, he had to learn how to wear a mask and speak through it.

Furthermore, Garin was deeply influenced by Antonio Gramsci (1891–1937), a founding member and one-time leader of the Italian Communist Party imprisoned during the Fascist regime led by Benito Mussolini (1883–1945). As others belonging to the same generation, Garin became familiar with the name of Gramsci by way of the characterization another crucial Italian intellectual, Piero Gobetti (1901–1926), proposed in his *Rivoluzione liberale* (1924). Despite leaning naturally toward the left, Garin decided to reject Marxist dogmatism in favor of the English Enlightenment, which he chose as philosophical creed in his formative years while he was writing his *laurea* thesis on the ethics of Joseph Butler under the supervision

of Ludovico Limentani (1884–1940) at the University of Florence.

After having earned his *laurea* in 1929, Garin worked as a secondary school teacher for two decades: First, until 1931 in the Regio Convitto delle Mantellate, a Catholic school for girls; then, between 1931 and 1934, at the Liceo scientifico Stanislao Cannizzaro in Palermo; and finally at the Liceo scientifico Leonardo da Vinci in Florence. In these years, Garin also shifted his research focus from the Enlightenment to the Renaissance, partly due to Limentani's influence and partly because the debate on the Renaissance had become center stage in a tragic moment in European history, which was witnessing the inexorable surge of Fascism and Nazism. Garin also wrote articles for the recently established (by Gentile) *Giornale critico della filosofia italiana*, at the time one of Europe's foremost philosophical journals, and was invited by Gentile (assassinated by partisans in 1944) to finish his history of Italian philosophy. First published by Vallardi in 1947, *La filosofia* (not to be mistaken with Garin's 1945 *Storia della filosofia*) was reworked and augmented by Garin to include modern Italian philosophy in a three-volume set to be published in 1966 by Einaudi with a new title: *Storia della filosofia italiana*. Renaissance thought and the history of Italian philosophy as a homogeneous subject will remain central intellectual concerns for him until his death.

By 1937, Garin had already published about four journal articles on Joseph Butler and moral philosophy in the English enlightenment starting in 1929, and in 1937 he published his first book, *Giovanni Pico della Mirandola. Vita e dottrina*, which established him as a major Renaissance scholar. He was 28 years of age at the time. Working on Pico della Mirandola, Garin had found his lifelong subject, Italian humanism, and in 1947 published, in German, *Der italienische Humanismus*, which in 1952, as *L'Umanesimo italiano. Filosofia e vita civile* became his most successful book (translated into English in 1965 as *Italian Humanism: Philosophy and Civic Life in the Renaissance*).

Garin was appointed to a full professorship in History of medieval philosophy at the University of Florence in 1952, where he taught for the next quarter century (obtaining in 1955 a chair in History of philosophy), but the 1968 political climate and student protests left him so bitterly disappointed that he considered resigning, and in 1974 transferred to the Scuola Normale Superiore at Pisa, where he held for the chair in History of Renaissance philosophy ("Storia della filosofia del Rinascimento") until his retirement. Here, he felt, communicating with students and continuing his teaching was easier because of the more selected and intimate setting that the Scuola Normale provided. He retired from the Scuola Normale in 1984 and 20 years later, in 2004, died in Florence at the age of 95. He kept publishing until the very end of the twentieth century.

Garin's bibliography includes thousands of publications, and his books range from the philosophical and historical, as *Medioevo e Rinascimento* (1954), *L'educazione in Europa 1400–1600* (1957), *La cultura filosofica del Rinascimento italiano* (1961), and *Dal Rinascimento all'Illuminismo* (1970); to the scientific, as *Scienza e vita civile nel Rinascimento italiano* (1965), *Filosofia e scienze nel Novecento* (1978), *Rinascite e rivoluzioni* (1975), and *Aristotelismo veneto e scienza moderna* (1981); to the astrological and hermetic, as *Lo zodiaco della vita* (1976) and *Ermetismo del Rinascimento* (1988); and to the autobiographical, as *La filosofia come sapere storico* (1959), to list but the most important.

Abstract

Theodore Gaza was a fifteenth-century Byzantine scholar and translator. He was highly respected as an expert on Aristotle. His work influenced Renaissance and early modern scholars interested in Aristotle's biological works. Gaza introduced a new method of translating and editing ancient texts which had great impact among translators and editors. He was associated with some of the most famous and influential Italians.

Synonyms

Gaza, Teodoro; Gazes, Teodorus; Gazis, Theodore

Biography

Theodore Gaza was born in Salonica, as his signature (*Theodorus Graecus Thessalonicensis*) implies. His family was probably well known and influential in the local community. When the Turks invaded his home city, Theodore fled to Italy. According to certain sources, not totally reliable, Gaza, before his trip to Italy, spent a few years in Constantinople, where he entered monastic orders. In Constantinople he befriended Francesco Filelfo (1391–1481) who probably encouraged him to migrate to Italy. Several sources attest Gaza's presence in the Council of Ferrara – Florence (1438–1439), although this is unlikely. Upon his arrival in Italy, he spent a few

years in Pavia (1440–1443) and then he moved to Mantua, where he became a student of the famous humanist Vittorino da Feltre (1378–1446), who in turn improved his Greek under Gaza's guidance. During his stay in Mantua, Gaza studied Medicine and perfected his Latin, while delivering lessons in Greek and translating manuscripts from Greek into Latin. In 1446 he became professor at the University of Ferrara, where he enjoyed high esteem and appreciation from his students. Soon his courses on Greek language became the main attraction of the University. Cosimo de' Medici offered him the chair that had belonged to Manuel Chrysoloras at the University of Florence, but Gaza rejected the offer. By 1449 he was a well-renowned humanist and Pope Nicholas V welcomed him to the Holy See and entrusted him with the translation of several works of Aristotle and other Greek authors into Latin. Cardinal Bessarion (1403–1472) encouraged Gaza to move to Rome, since Bessarion was persuaded that Gaza's knowledge and efficiency would be helpful for other scholars who sought to improve the quality of their translations. Gaza's texts were the standard for the translation of scholarly works. During his stay in Rome, he continued his teaching activities. He also engaged with Aristotle's *Libri Naturales*, especially with his biological writings. Gaza devoted many years of the rest of his life to the editions and translations of Aristotle's *Libri de animalibus*, the first version of which was completed by 1458. Before engaging with Aristotle, he had translated Theophrastus' botanical treatises (*Historia plantarum* and *De causis plantarum*). Soon, Pope Nicholas V (1397–1455) acknowledged Gaza's competence in ancient languages and asked him to correct Georgius Trapezuntius' (1395–1472/1473) translations, when the latter fell out with the Pope because of the poor quality of his commentary on Ptolemy's *Almagest* and of his the translation of Aristotle's *Problemata*. After that, Gaza and Trapezuntius became rivals. Cardinal Bessarion, Trapezuntius' main opponent, supported and promoted Gaza's translations to the literate audience of the period. In his translations Gaza used to scorn previous translators and commentators in an attempt to highlight his contribution to classical education. According to

Trapezuntius, Gaza's choice was indicative of his low appreciation for scholastic philosophy and theology. But that was not Gaza's and Trapezuntius' first public dispute. When Gaza arrived in Rome, he attended Trapezuntius' lectures on rhetoric and blamed him of employing false examples and misinterpreting the purpose of oratory. Gaza held that, besides persuasion, the orator ought to aim to beautiful expression. Trapezuntius bitterly remarked that Gaza was simply reproducing Roman sources, especially, Quintilian. After the Pope's death, Gaza moved to Naples, where he continued his work under the patronage of King Alphonso. He translated texts of John Chrysostomos and contributed to the edition of Arrian's *Tactica*. During his stay in Naples, Gaza corresponded with Bessarion and kept him posted about Trapezuntius' activities in the city. In the same period, Trapezuntius published the *In Perversionem Problematum Aristotelis a quodam Theodoro Cage editam et problematice Aristotelis philosophiae protectio*. The work's title is indicative of Trapezuntius' dismissive attitude toward Gaza. Trapezuntius maintained that Gaza had rearranged the structure of the text and did not alert his readers to the fact that he had deviated from the Greek original text on a number of occasions. Gaza also introduced new technical terms, which made the text tricky in certain cases. While Gaza was interested in *bene dicere*, Trapezuntius prioritized scientific precision. Gaza took into account Trapezuntius' remarks and revised his translation. Trapezuntius blamed Bessarion of initiating a plot against him and Gaza was acting as Bessarion's front man. Trapezuntius derided Gaza by misquoting his surname: he called him *Cages* and his admirers *Cagulei*. In addition, he warned king Alphonso of Naples that Gaza and his followers were threatening Christian faith and were allies of the archetypal Antichrist, that is, Pletho (1355–1454). Trapezuntius' accusations were obviously false. It is noteworthy that Gaza, in the early 1450s, felt victim of the accusations of Michael Apostolis (1422–1478), a Greek émigré and Bessarion's protégé. Apostolis argued that Gaza had misinterpreted Pletho's views on substance in an attempt to defend Aristotelian

metaphysics and for that reason, had distorted Pletho's thought. Andronicus Callistus (d.1478), Gaza's relative and student, replied to Apostolis in support of Gaza and Aristotle. Bessarion felt the need to intervene in the dispute and also defended Gaza and Aristotle, as well as Plato. A few years later (1460), Demetrius Chalcocondyles (1423–1511), another student of Gaza, composed an additional defense of his mentor, which elicited a bitter response from Apostolis. The dispute lasted almost a decade. Gaza was a devoted Aristotelian, but he did not downplay the significance and value of Platonic philosophy. In addition, his works display his high esteem for Stoic and Christian philosophy. Despite their disputes, both Gaza and Trapezuntius agreed that Pletho's works threatened Christianity. Gaza refuted Pletho's *De fato* and composed the *De mensibus*, a short treatise in reply to Pletho's *Nomoi*. Yet Gaza's and Trapezuntius' rivalry never ended. Gaza got embroiled in another dispute between Bessarion and Trapezuntius about the purpose of nature. Pletho, after reading Aristotle on nature, concluded that the latter did not hold that God directs the universe, because nature does not deliberate. Gaza, during the period 1455–1458, rejected Pletho's argumentation and supported Aristotle. He urged Bessarion to write a short treatise in order to express his views on the issue. Trapezuntius did not miss the chance and attacked Bessarion on the basis of Aristotelian philosophy. Bessarion replied with his famous treatise *De natura et arte*, in which he attacked Trapezuntius. The latter thought that Gaza was the author of the treatise since he had access to the text before its first publication. As a result, Trapezuntius once again launched a fervent attack on Gaza. After 1458 Cardinal Bessarion offered Gaza a benefice in Calabria, where Gaza resided until his death. In his personal correspondence he confessed to his friends that he was confronted with financial problems, because the Roman Curia was not generous with scholars like him. However, he did not refrain from taking part in philosophical debates. When Bessarion decided to reply to Trapezuntius' *Comparatio Philosophorum Platonis et Aristotelis*, he asked Gaza to review the first draft

of the work. Gaza accepted and sent him his comments and views, which in fact influenced the final version of Bessarion's *In Calumniatorem Platonis*. A few years before his death, probably just before 1470, Gaza defended Bessarion against John Argyropoulos' (d.1487) criticisms. Argyropoulos did not agree with Bessarion's views about concepts and published a short work, which is no longer extant. Gaza replied with his *Antirrheticon* and held that Argyropoulos had misunderstood Bessarion's argumentation. The truth is that Gaza attempted to justify Bessarion, although Argyropoulos' arguments were accurate. Gaza was buried in the monastery of San Giovanni a Piro. According to several reports, a few years before his death, Pope Sixtus IV (1414–1484) had insulted him when he rewarded Gaza with a small amount of golden coins for his work, probably the translation of *Historia Animalium*. Gaza felt offended and threw the money into the Tiber. Although Gaza felt dissatisfied with Pope Sixtus' ingratitude, the story about the money seems to be false. According to Raffaele Maffei, Gaza also translated Cicero from Latin into Greek, while in his early years in Italy he had translated from Greek into Latin works of Michele Savonarola.

Innovative and Original Aspects

Gaza introduced a new method of translating and editing Aristotle's texts, which influenced subsequent translations and commentaries. He was aware of the fact that ancient and medieval editors and scribes had distorted the original sources. As a result, the primary and most crucial task of the translator and editor was to restore the text to its original form. That required drastic interventions and changes, including the omission of passages or even books and the complete rearrangement of the rest of the text. According to his associates, such as Nicolaus Gupalatinus, Gaza kept himself occupied sometimes for over a year with the restoration of a text before he started the translation. Of special importance was Gaza's *Γραμματική Εισαγωγή*, since it was more popular than similar attempts in the same century.

Impact and Legacy

Gaza was held in high esteem by his fellow humanists for the quality and originality of his works. After his death, Ermolao Barbaro wrote a letter to Pope Sixtus IV praising Gaza. His translations on Aristotle's biological works were by far the most influential ones during the sixteenth century. Despite the fact that Trapezuntius also translated the same works, Gaza's translations were published more than forty times in the fifteenth and sixteenth centuries. The availability of the texts led humanists to study and comment these specific Aristotelian treatises. Gaza evinced interest in biology as well, since he corroborated with Bussi the edition of Pliny's *Historia naturalis*. Gaza's translations were appreciated by almost all key - Renaissance humanists. Aldo Manuzio admitted that Pico della Mirandola, Poliziano, Barbaro, and Donato improved their knowledge of Greek language by studying Gaza's works. Erasmus, Sylburg, Camotius, and Casaubon appreciated his work on *Libri de animalibus* and followed his corrections. Erasmus praised also Gaza's *Grammatica*, which he considered of superior quality to that of Ianus Lascaris (1445–1535). The German mathematician and astronomer Regiomontanus acknowledged Gaza's contribution in his work, since Gaza introduced him to Ptolemy. The famous humanist and logician Rodolphus Agricola (1444–1485) was probably among his students. Andronicus Callistus and Demetrius Chalcocondyles, the influential Greek humanists and translators, were also Gaza's students.

Generation and Embryology in Renaissance Science

Hiro Hirai
Center for the History of Philosophy and Science,
Radboud University Nijmegen, Nijmegen, The
Netherlands

Abstract

Embryology is a study of generation in both plants and animals. The generation of living

beings was one of the most central and difficult problems for natural philosophers in the Renaissance. The complex structure of living bodies and their functions had to be explained from the first stage of their formation. This was the quintessential aspect of embryology. Many factors involved in the phenomenon were invisible and imperceptible to human senses, while the traditional explanatory tools of philosophy and medicine, whether Aristotelian or Galenic, did not provide a satisfying answer. The problem forced physician-philosophers to scrutinize the newly rediscovered texts of the ancients and even craft ideas and concepts not employed elsewhere.

Heritage and Rupture with Tradition

Generation was one of the major problems confronting natural philosophers in the Renaissance and early modern period (Roger 1963, 1997; Duchesneau 1997; Smith 2006). Among many ideas and influences in embryology, the theory of “formative power” (*virtus formativa*) was the focal point of debates carried out by physician-philosophers. Frequently used in medieval embryology, the origin of this theory can be traced back to the Greek physician, Galen (129–ca. 216). For Galen this power could not be reduced to the primary qualities (hot, cold, dry, and wet) of the four elements and was responsible for the complex organization of living bodies.

Nicolò Leonicensio (1428–1524) was prolific in producing widely used translations of Galen's works. He also composed the first “humanist” embryological treatise, *On Formative Power (De virtute formativa)*. There he tried to explain Aristotle's and Galen's views on formative power with the help of newly recovered texts by Aristotle's Greek commentators and Galen. According to Leonicensio, Galen's formative power should be understood as a “faculty” (*facultas*), or power, of the vegetative soul, which is in turn identified with innate heat or a certain temperament of the

body of living beings (Leonicensi 1506; Hirai 2011).

Innovative and Original Aspects

French physician Jean Fernel (1497–1558) rejected Leonicensi's naturalistic interpretation. For him if the soul of living beings was identified as the body's innate heat or temperament, it depended on the four elements, being transient and therefore destructible with the body. This contradicted the Christian doctrine of the immortality of the soul. Calling upon Renaissance Platonism developed by Marsilio Ficino (1433–1499), Fernel tried to present another image of Galen that could resonate with Christianity. The chief fruit of his endeavor was the dialogue *On the Hidden Causes of Things* (*De abditis rerum causis*). For Fernel the seed's formative power results from the heavenly realm, that is, from the cosmic mind mentioned by Galen, and the World-Soul held by the Platonists. He qualified this power as celestial and divine, exceeding the order of the four elements and their forces (Fernel 1548; Hirai 2011).

In his embryological work, *On the Plastic Faculty of the Seed* (*De plastica seminis facultate*), Jacob Schegk (1511–1587) advanced that the “formative and plastic faculty” (*facultas formatrix et plastica*) was the most remarkable force of natural things, by which God skillfully preserves the perpetuity of all sublunary species. For Schegk the plastic faculty was a power created by God as His “invisible hand,” something intermediate between actuality and potentiality, that is, between what is animate and what is to be animated (Schegk 1580; Hirai 2011).

Impact and Legacy

In his *Physical Memories* (*Hypomnemata physica*), Daniel Sennert (1572–1637) made a critical assessment of the ideas advanced by his

forerunners. His treatise encompasses the cluster of issues raised in the intersection of matter theories and the life sciences of his time. For him the formative power of the seed is nothing but the soul. It is absurd, he argues, to think that formative power produces such a noble and divine substance as the soul. He concluded that this power cannot be the “faculty of the seed having no soul” but the “faculty of the soul residing in the seed.” He thus rejected the idea that the seed's formative power produces the soul (Sennert 1636). Sennert's discussion exerted a considerable influence on the next generations of natural philosophers, including William Harvey (1578–1657), by disseminating not only his own ideas but also those of Fernel and Schegk (Hirai 2011).

Generation in Renaissance Sciences

Georg Toepfer

Center for Literary and Cultural Research Berlin,
Berlin, Germany

Abstract

Following ancient authors, generation is seen in the Renaissance as one of the central, characteristic features of living beings. Likewise, during the Renaissance, Aristotelian premises and principles continued to be influential in explaining generation processes. In this respect, many authors made their arguments based on spiritual forces and formative virtues. Such efforts became increasingly concerned with connecting the immaterial forces with the material basis of living things and the simple movements of particles that can be described physically. In the wake of these developments, numerous attempts were made at relating Aristotelianism to mechanistic philosophy as in the understanding of Aristotelian substantial forms as causal principles that can be reconstructed mechanically or in the presumption that there are a number of substantial forms that exist below the level of our perception of things that can be seen with the naked eye. The “technomorphous” model would continue to establish itself as the basis for such explanations. According to the model, life processes can be described based on patterns of technical processes. The displacement of the form-giving forces into the material itself leads to, among other things, depicting an embryo as having much greater autonomy when it comes to creating new lifeforms even to the extent of completely excluding the soul. The milestones set by Renaissance scholars were not merely due to their role in developing the first approaches to alternative, theoretical frameworks for thinking about generation processes (preformation vs. epigenesis), but they were moreover responsible for establishing experimental

methods for the emerging field of embryology.

Heritage and Rupture with the Tradition

The Latin expression *generatio* is the old technical term for the propagation of organisms. In classical Latin, in the writings of Pliny for example, it is used to refer to animal reproduction and later expands to become a general term in this subject area. Similarly, Aristotle’s writing on the reproductive methods of animals together with his other zoological works were translated into Latin in the early thirteenth century by Michael Scotus from the Arabic and around 1260 by William of Moerbeke from the Greek both under the title *De generatione animalium*.

Since antiquity, a second meaning has been associated with the expression alongside its significance as related to the reproduction of organisms: the portion of individuals in a population that belong to the same age group (cohort). Homer and Herodot were already using the term in this sense, for example, when they claim that a man witnesses the passing of two generations (“γενεαι”) or by dividing a century into three generations.

Throughout the ages, reproduction has served as one of the defining characteristics of living beings alongside the need for nourishment. All living beings, Plato claims, strive for conception and generation. Supposedly, they would even accept hunger and their own death before renouncing reproduction (Plato, *Symposium* 207b). Reproduction enables the prolonged longevity of living beings, indeed even immortality, according to Plato. Aristotle sees it similarly and deems breeding and consuming nutrients as the most natural activities performed by all living beings (*De anima* 415a). Aristotle accords feeding and reproducing their very own part of the soul, the *nutritive soul*, which, in contrast to other psychic faculties like perception and intellect, is also found in plants.

Following Aristotle’s doctrine of the soul, reproduction is often discussed in conjunction with nutrition and growth. For Aristotle,

reproduction consists in “producing another being that is the same” and is a procedure by which a living being incorporates itself into an infinite process. Through reproduction, a living being preserves itself (or at least its organization) in the potentially infinite chain of its offspring and thereby partakes to some extent in the “eternal and divine.” Aristotle differentiates between different forms of procreation. In addition to the sexual reproduction characteristic among sanguiferous land animals, for which the two sexes couple, he also mentions asexual reproduction, which he explains by positing the primal propagation of organisms out of inorganic matter.

Medieval theories of nature, like Aristotle, also saw reproduction as the primary objective of a living being. Avicenna traces reproduction back to a special “generative force” that he describes as the “ultimate goal” among vegetative life and as pertaining to the “priority of the final cause.” The recourse to a reproductive force (“virtus generativa”) is firmly anchored in scholastic philosophy, for example, in the works of Albertus Magnus. For Thomas Aquinas, this force is not limited specifically to living beings because any body that can come into existence and fade from it partakes in propagation (“generatio”). On the other hand, Thomas, following Aristotle, sees reproduction as the ultimate goal of living beings. With this capacity for reproductive force, the vegetative soul gains something of the virtue of the sensitive soul because reproduction means that living beings do not only exist in relationship to their *own* bodies but also in relationship to *others* (1266–73, I, 78, 2). The scholastic philosophers, like Aristotle before them, argue that reproduction allows all living beings access to immortality. Because all movements are ultimately directed towards obtaining perfection and the eternal, and because reproduction has something of this eternity through the infinite sequence of generations, the living being’s struggle to reproduce finds an explanation in the context of this metaphysics of eternity.

Up into the early modern period no one doubted the functional understanding of reproduction as one of the highest goals among various activities conducted by living beings. Accordingly, in 1583

Andrea Cesalpino repeats the conceptualization of life from antiquity, when, in reference to plants, he once again states that the goal of life resides in reproduction (*De plantis* I, vi).

Innovative and Original Aspects

The innovative elements within theories of reproduction from the Renaissance consist in slowly shifting the explanatory framework. A “technomorphous” model established itself as the physiological basis for explanations. Early indications of this development can be found in Thomas Aquinas’ writings, in which he creates analogies between biological creation and concepts taken from technical terminology (Mitterer 1947). In contradistinction to later understandings of the term, Thomas Aquinas considers an actual generation (“generatio”) to occur only when a living substance (i.e., a living thing) produces another living substance from some part of itself that is not living (in humans, for example, that might be the blood of the uterus) (1266–73, I, 114). Because generation always involves a non-living substance giving something life, it is also always a kind of spontaneous creation. When a (new) living substance is produced by its own kind, Thomas considered that development, not generation.

Aristotle’s explanation of substantial forms remained influential during the Renaissance and the early modern period with its emphasis on the efficaciousness of psychic faculties and formative virtues. These immaterial forces would, however, become more and more incorporated into mechanical processes through their recourse to the material basis of living things. Julius Caesar Scaliger’s understanding of Aristotle’s substantial forms as active principles points in this direction: They give shape to a body and can exist multiply, together in one body (*Exotericarum exercitationum liber xv*, 1557). Fortunio Liceti’s theory of imagination and its influence on heredity also includes an attempt to reconcile Aristotelianism and mechanistic philosophy (*De perfecta constitutione hominis in utero*, 1616): Imaginations contain mechanistic elements insofar as

they are conceived of as bodily operations that are especially significant in (abnormal) hereditary processes. His explicit position as part of an Aristotelian tradition can be seen in the extent to which he formulates his premises based on traditional conceptions of the soul, for example, with the idea that the vegetative soul extends throughout the entire body. In spite of himself, Liceti's theory of extension and his materialist theory of the imagination and hereditary characteristics both provide building blocks to help overcome Aristotelian ideas (Smith 2006; Blank 2010). Kenelm Digby's theory of animal reproduction also presents a similar attempt to bring together Aristotelianism and mechanistic philosophy: In Digby's opinion, living beings are made up of tiny parts that maintain their form, as well as existing as individual beings with a cohesive and substantial form that results from the interdependence of their parts (*Two Treatises*, 1644; Cheung 2008; Blank 2010).

Jean Fernel already formulated an extensive mechanistic theory of generation in the mid-sixteenth century. His theory states that male and female seeds are made up of material particles that mix together during fecundation and consequently produce fermentation that enables the ordered movement of the particles necessary for fetal development (*Physiologiae libri VII*, vii, 9, 1554). Fernel's ideas set a precedent insofar as they lend seeds a far-reaching autonomy in terms of constituting life forms. Indeed, he sees them as independent of the soul. The mechanistic philosophers of the seventeenth century, among them most notably Descartes, would adopt these materialist ideas (V. Aucant, in Smith 2006). Descartes' own experimental research into the development of chickens lead him to repeatedly revise his answer to the question as to which organ forms first: from his initial conviction that the lungs and liver come first, his opinion shifts back to the Aristotelian idea that the development of the fetus begins with the heart (*Description du corps humain*, 1648). Putting great faith in the deterministic character behind the process of development, Descartes claims that precise knowledge on the structure of the seed might allow one to "deduce" the structure of the fully developed body and calculate it with

mathematical certainty (1648, p. 277). In this respect, he proves to be an early representative of a theory that proposes that the form of the organism to come is already completely contained within the seed (*preformationism*).

In contrast to Descartes, William Harvey belongs to those authors who continue to formulate their arguments within the framework of Aristotelian substantialism. But unlike Aristotle and his orthodox followers, Harvey accepts that there are a number of substantial forms that exist on a level below those things that are perceptible to the eye ("microsubstantiality," Smith 2006, p. 9). Among these forms, he postulates the existence of eggs from which all higher life forms develop. Harvey thoroughly studied the development of the chicken embryo in its shell using experimental methods. He followed methods used by Aristotle as well as Renaissance scholars such as Ulisse Aldrovandi, Volcher Coiter, and Hieronymus Fabricius: After cracking open chicken eggs at various stages of their development, the successive appearance of organs in the fetus can be observed. The interpretation of such observations was, however, accompanied by a lot of speculation. Fabricius, for instance, postulated that a chick's development starts with its skeletal framework – analogous to the building of a ship (*De formatione ovi et pulli*, 1621).

Increasingly, direct observations would become the standard for evidence used to back up claims: Thus, Harvey assumed that the heart was the first organ to develop in the fetus, because it was the first one that was visible. Even Harvey's opinion that both sexes contributed to the formation of offspring with qualitatively similar contributions had an empirical basis because the offspring resemble both the mother and the father. This ran counter to the old opinion going back to Aristotle, which states that the female part alone provided the matter while the male part provided the form (Cole 1930). Finally, Harvey's argument that all higher-level animals develop from eggs has an experimental basis: In his dissections of mammalian uteruses, he was unable to detect masses of semen and concluded that eggs, therefore, originated in the female. And yet in other concerns Harvey remained loyal to Aristotelian conceptualizations, especially in his

tenacity when it came to the terminology of the soul: He explained the emergence of a new individual as the unification of the vegetative soul (located in the amorphous female egg) with the animal soul (carried by the male sperm), which provided the stimulus and configurational force for the progressive development of the egg into the specific form of that species. Harvey especially emphasized the way that structures in embryos come into existence; namely, they gradually accumulate and create new structures based on other structures (for which Harvey coined the term *epigenesis*). Additionally, Harvey was also aware of another way that forms come to exist, namely, as based upon a preformed material from the start (*Anatomical Exercitationes, Concerning the Generation of Living Creatures*, 1653). Thus, Harvey evokes the Aristotelian idea that the seed is where potentiality resides, while actuality comes about only once the organism is fully developed.

Impact and Legacy

In numerous points, Renaissance scholars prepared the way for later developments in the scientific study of generation. Among them were the establishment of the experimental method, the effort to renounce metaphysical explanatory principles and to instead use mechanistic principles to explain the organic formation of life, as well as the development of alternative theoretical frameworks for thinking about generation processes (preformation vs. epigenesis). Intense debates concerning these explanatory frameworks would dominate discussions on the topic over the centuries to come.

The model that was first favored posits development as based on preformed structures. This perspective gained credence with the introduction of the microscope in studying processes of organic development, for microscopic analysis could provide an image of a surprisingly differentiated embryo in which it appeared that later organs could be seen as miniaturized structures. Another factor that spoke for the preformation theory could be found in the work of Francesco Redi (*Esperienze intorno alla generazione*

degli insetti, 1668), whose experimental research refuted the theory of spontaneous generation. After the spontaneous creation of life from inorganic matter was disproved, the notion that spontaneous differentiation could take place in an undifferentiated seed seemed problematic. The decisive reason, however, as to why preformation theory took hold was due to the fundamental mechanistic orientation of seventeenth-century scientists' approach to research: From a mechanistic standpoint, it made more sense (and caused less difficulties) if the theory presumed the existence of a seed that was already differentiated in the first place rather than to assume that there was a regular regeneration of ordered structures taking place. Another dominant idea (with theological backing) was that nature could not organize itself, or as Charles Perrault states, the soul of animals cannot be created naturally but must be passed on from a seed that precedes it (*Essais de physique*, 1680, vol. 2, pp. 273 ff.).

The lack of adequate models posed a significant problem to the efforts of mechanistic thinkers in the seventeenth century who were trying to explain the formation of structures as part of a theory of life. This lack was responsible for inspiring various people to posit specific organic, immaterial principles and "vitalist" forces as, for example, in the figure of a human master workman, as conceived by Jan Baptist van Helmont, which he termed "archeus faber" (*Ortus medicinae*, 1648). According to van Helmont's theory, the archeus resides within every "seed" and transforms it into a differentiated organism. The life processes of the adult organism are also organized and regulated by a hierarchy established by the archeuses according to this theory. Towards the end of the seventeenth century and into the eighteenth many arguments were held between the "vitalists" and those scientists with a stronger leaning toward mechanism regarding the existence and location of a central organizing principle.

Gentile, Alberico

► [Gentili, Alberico](#)

Gentili, Alberico

Born: 1552, San Ginesio

Dead: 1608, London

Stefano Colavecchia

Dipartimento di Scienze Umani Sociali e della Formazione, Università degli Studi del Molise, Campobasso, Italy

Abstract

Alberico Gentili was an Italian jurist who was exiled to England for *religionis causa*. He had studied law in Perugia and obtained his doctorate in 1572. In 1579, he was forced to flee Italy to escape the Inquisition's persecution, along with his father Matthew and his brother Scipione. Following a lengthy European pilgrimage, Gentili took refuge in London in 1580, where he quickly became a member of the Leicester-Sidney circle, the most influential of the time, in pursuit of a prestigious academic position. His commitment and literary production were vast, intervening in all major political and religious facets of contemporary England. Gentili embraced the Anglican faith, initially siding in favor of the Elizabethan policy and later the James I policy, supporting political autonomy from the jurisprudence of theology. His masterpiece was the *De iure belli*, in which he broke with the medieval tradition of just war and secularized the concept of war, reserving exercise to sovereign states. Gentili theorized the necessity of religious tolerance within the state, entrusting the government responsibility to ensure that there were no acts of violence and to mediate between the parties. His political thought oscillated between Republicanism and absolutism. In *De Legationibus*, Gentili praised Machiavelli as a Republican anti-tyrannical author, while in the later *Regales disputationes*, the jurist sided in favor of Stuart absolutism. This ambiguity was typical of Gentile's thought process, which is characterized by certain underlying tensions between what was useful and honest, between innovation and conservation, and between the

defense of Republican freedom and affirmation of full sovereignty.

Alternate Names

Gentile, Alberico; Gentilis, Albericus; Gentili, Alberigo

Biography

Born during the Pontifical Marcus era, Alberico Gentili grew up in a family context marked by the religious heterodoxy of his father Matthew. Getting closer to the ideas of Zwingli and Vermigli, and after obtaining a law degree in 1572 in Perugia according to the *mos italicus*, in 1579, he was forced, together with his father and younger brother Scipione, to leave Italy to escape the Inquisition, who was preparing people to stand trial for heresy. He took refuge in Carniola and then in Germany, and then went to London in August 1580, where he settled down permanently. Thanks to the relationship between his father Matthew and Giovan Battista Castiglione, an influential member of the Privy Chamber of Elizabeth I, Alberico approached the political and cultural circle of Philip Sidney and the Earl of Leicester. The latter recommended the admission of Alberico at St John's College, Oxford, where, from January 1581, the exiled Italian started teaching civil law. Gentili embraced Anglicanism with conviction, and he particularly appreciated the moderation of the English church and its direct leadership, affording the Anglican religion a sort of "civil faith" (Lavenia 2009) of Machiavellian connotations engaging his reflections on all political, legal, and religious aspects of his time. He was called as a consultant by the British Government during the Mendoza case, and it was his belief that the inviolability of the ambassador was in accordance with the principle of "neque caeditur, neque violatur" (Gentili 1585). On the basis of this experience, Gentili wrote his treatise on diplomacy, *De legationibus*, where, in addition to drawing the paradigm of the perfect diplomat, he formulated a passionate

apology of Machiavelli's *Discourses*, interpreted in a Republican and anti-tyrannical way. He was accused by the Puritans of atheism and religious and Machiavellianism simulation. And it was due to certain statements he had made in favor of *mendacium officiosum* (Lavenia 2015) that Alberico left England for a brief period in 1586. However, in June 1587, thanks to his influential protectors, Gentili was appointed *Regius professor* of civil law at Oxford. He remained in office until 1605, when he left teaching to take up the post of attorney of Spain with the admiralty court. For his strenuous assertion of the autonomy of law and the theology of politics, Gentili clashed long and hard with the Puritans led by theologian John Rainolds. The clash peaked between 1593 and 1594 on the occasion of the dispute on stage-plays. Gentili, in a polemical correspondence with Rainolds, reiterated his conception of law as an autonomous science from theology and as a *Summa Magistra* in the lives of men (Minnucci 2016). Gentili is considered a founding father of international law thanks to his masterpiece, *De iure belli*, published in 1598. The *De iure* marked a break with the legal tradition of the just war. Inspired by the positions of Bodin and *politique* tradition, Gentili secularized the reasons for weapons, while allowing sovereign States equal rights in the international arena, the monopoly of the *ius ad bellum*. In addition, the lawyer entrusted the sovereign power responsibility for ensuring religious tolerance. Gentili supported the unrestrainability of consciousness and the rejection of the violent imposition of faith. According to Gentili, tolerance is an inviolable principle, provided that it does not put the health of the state in any danger. Under the reign of James I Stuart, Alberico published the *Regales disputationes*, where he sketched an idea of an extensive and absolute sovereignty. It was 1605, the year of the Gunpowder Plot, and Gentili was focused entirely on preserving the health of the state, which he considered to be the supreme basis of human social life. The ambiguity of Gentili's thought reflects the age of deep crises and transformation in which the lawyer from San Ginesio lived through. The tensions that animated his thoughts were based on pragmatic and moral

dialectics, such as the conflict between the defense of republican freedom and the affirmation of absolute sovereignty. Gentili died in London in 1608, and his thoughts quickly slipped into a kind of oblivion, primarily as a direct consequence of the close relationship of his work with the contingency of the time. However, between the seventeenth and eighteenth centuries and as a direct result of a triangulation between England, Germany, and Italy, Gentili's ideas experienced a first discovery, a forerunner of the most important renaissance of Gentilian studies that began in the late nineteenth century.

Gentillet, Innocent

Born: 1532, Vienne, France

Died: 1506, Geneva, Switzerland

Michele Lodone

Scuola Normale Superiore, Pisa, Italy

École des hautes études en sciences sociales,
Paris, France

Abstract

Jurist and political writer of Huguenot faith, Innocent Gentillet was born in Vienne (France) around 1532 and died in Geneva in 1588. His most popular work, among contemporaries, was no doubt his *Discours... contre Nicolas Machiavel Florentin*, or *Anti-Machiavel*. Published in Geneva in 1576, his *Anti-Machiavel* was one of the first and most remarkable voices of the antimachiavellian European tradition, maybe the widest and most methodical declaration of the wickedness of the author of *Il Principe*, who was considered a master of deception and a theorist of immorality and despotism. The provocative aim of the author was quite clearly detectable among the Florentine *entourage* that, at court, surrounded Queen Caterina de' Medici; nevertheless the work became really popular also beyond France, and it could count on several reprints and translations into Latin, German, and English.

Biography

Gentillet was born in Vienne, in the Delphinat, around 1532. He worked as a lawyer in his hometown, before he found refuge in Geneva, due to religious reasons, from 1572 – after Saint Bartholomew's massacre – till 1578.

Back in his home country, he followed the Duke François di Lesdiguières, chief of the Protestant front line, and he held the position of chairman of the newly established Parliament of Grenoble. As chairman he met, in August

1579, Queen Caterina de' Medici – who, in her private letters, did not hide her irritation and her mistrust for Gentillet's and for the other Huguenot delegates' behavior. In 1585 he moved again to Geneva, where he died in June 1588 (Stewart 1969).

Heritage and Rupture with the Tradition

Beyond some works more strictly linked to his political and religious commitment (e.g., Gentillet 1578), Gentillet's most celebrated work, among contemporaries, was no doubt his *Discours sur les moyens de bien gouverner et maintenir en bonne paix un royaume ou autre principauté... Contre Nicolas Machiavel Florentin*, also known as *Anti-Machiavel* (Gentillet 1576, 1968, 1974). His *Discours* was printed in 1576 in Geneva, with the permission of the city's authorities, but without typographic indications and without the author's name (which appeared only in its reprint in 1585).

Gentillet's *Anti-Machiavel* was one of the first and most remarkable voices of the antimachiavellian European tradition, maybe the widest and most methodical declaration of the wickedness of the author of *Il Principe*, who was considered a master of deception and a theorist of immorality and despotism. Though not devoid of sharp references to the texts, Gentillet's reading was openly partial and factional. To the connection among machiavellians, Florentines (and Italians) and "atheists" Gentillet opposed a French method, respectful of morality and law, to elaborate politics. The provocative aim of the author was quite clearly detectable among the Florentine *entourage* that, at court, surrounded Queen Caterina de' Medici (Anglo 2005; Lavenia 2014).

Following the stir caused by his strict stance, in May 1576, Gentillet published a *Declaration de l'auteur des discours contre Machiavel, pour satisfaire aux plaintifs d'aucuns Italiens*, which furtherly embittered the souls of the several Italian exiles in Geneva, among whom one – Francesco Lamberti – attacked Gentillet even physically (Carta 2008).

Impact and Legacy

Gentillet's *Anti-Machiavel* became widely popular and was appreciated by authors like Bodin, Montaigne, Pasquier, and La Popelinière. Also outside France, the work could count until the mid-seventeenth century on several reprints and translations into Latin, German, and English (Procacci 1995; Quagliioni 2011).

Genua, Marco Antonio

Born: 1491, Padua, Italy

Died: 1563, Padua, Italy

Leen Spruit

Faculty of Arts and Center for the History of Philosophy and Science, Radboud University Nijmegen, Nijmegen, The Netherlands

Abstract

Marco Antonio Genua (1491–1563), an Italian philosopher, studied arts and philosophy in Padua, where he taught philosophy from 1517 till his death in 1563; in his commentary on Aristotle's *De Anima*, he sought to harmonize Simplicius' psychology with central insights of Averroes' noetics; he left manuscript commentaries on *De Anima*, *Physica*, *De Caelo*, and *De Generatione et Corruptione* as well as a *Disputatio de Intellectus Humani Immortalitate* (1565).

Biography

Marco Antonio Genua was born in 1491 in Padua from the noble family de' Passeri who, having held positions of great prestige in Mantova and Modena, was forced to take refuge in Genoa. They finally settled in Padua. After the stay in Genoa, the family changed also the surname adding "Genua" to the original. Son of Nicholas, a physician, philosopher, and professor of medicine at the University of Padua, Marco Antonio graduated in arts and medicine in 1511/1512 and began his career in 1517, holding the second chair of extraordinary philosophy. In 1518 he became the first professor of extraordinary philosophy, in 1523 he occupied the second ordinary chair of philosophy, and in 1525 he found himself to be a competitor of Marco Antonio Zimara. In 1531 he left this chair to pass to the first chair which he occupied until his death. His education in liberal arts allowed him to deepen the study of the Greek commentators, especially Simplicius. Among his

students are eminent names like Jacopo Zabarella, Bernardino Tomitano, Agostino Valier, and Giovanni Fasolo who translated the commentary of Simplicius in Latin in order to allow for a wider spread. Genua died in Padua in 1563. His production is limited in print, amounting mainly to *De vita tranquilla* (1545), reports from his university lectures on the *De Anima* (published in Aristotle 1574), his commentary on the *De Anima* (1576), and *Naucula Petri opusculum principibus, baronibus, pauperibus, aliisque Christi fidelibus apprimè vtile* (1624). The handwritten production consists of commentaries to the texts of *De Anima*, *Physica*, *De Caelo*, and *De Generatione et Corruptione*, for the most part preserved in the Ambrosian Library and the Vatican Library.

In the *Disputatio de Intellectus Humani Immortalitate* (1565), Genua presented a detailed rebuttal of the views of Pietro Pomponazzi, Alexander of Aphrodisias, and John Duns Scotus. Genua argued for an “analogical” definition of the human soul, drawing an “essential” distinction between the intellect and the senses, viewed as different species. That the intellect is able to know abstract entities, itself, and the separate substances, definitely proofs its immateriality and by consequence its immortality (*Disputatio*, pp. 48–53).

In his commentary on *De Anima* (posthumously published in 1576), Genua sought to harmonize Simplicius’ interpretation of Aristotle’s *De Anima* with central insights of Averroes’ psychology. Genua based himself on the Simplician theses that the essence and cognitive activity of the rational soul should be analyzed in terms of the relation between the separate intellects and sensible reality, and the substance of the soul is essentially one and many (*In de anima*, fol. 23vb). From Averroes he took over the view that the specific nature of man depends on the “*cogitativa*” (*In de anima*, 37ra-va; cf. 139va). The soul, which informs the body, uses this as an organ. Elsewhere, he argued that man knows through the intellectual soul, but he excluded that the (unique) intellect endows man with his specific being (*In de anima*, fol. 132vb). Thus, Genua wanted to bring together Simplicius’ view of a dynamic

rational soul and Averroes’ notion of a unique intellect.

Using the terminology developed by Simplicius, Genua referred to the active and potential intellect as “*intellectus perfectus*” or “*manens*” and “*intellectus progressus*,” respectively (*In de anima*, 146rb, 152vb, and 157vb). Descending toward the “*secundae vitae*,” the unique intellect undergoes essential change (*In de anima*, fol. 127ra). Genua observed that Simplicius’ noetic terminology should be preferred to the traditional denominations of agent and possible intellect. Following Simplicius, the “*intellectus progressus*” was said to have two states, one potential and the other in act (*In de anima*, 157vb). Elsewhere, Genua integrated this dynamical view of the intellect with a somewhat more traditional classification of the cognitive faculties.

Like Averroes, Genua believed that the cognitive act depends on the body as its *conditio sine qua non*. The intellectual soul is not the form of the body, however, but the formal principle by virtue of which man has knowledge (*In de anima*, 132vb and 138rb). In this construction the intellect needs phantasms for its acts (*In de anima*, 135ra). From Simplicius Genua took over the view that the intellect is not completely passive or potential, as appears from the platonizing definition Genua gave of the Aristotelian “*pati*.” Intellectual knowledge does not depend on incoming forms or representations. Indeed, the description of the intellectual soul as a “*locus formarum*” holds only for contents “*a se ipsa fluxa*,” since the idea that intelligibles may penetrate the soul from without involves a contradiction (*In de anima*, 127vb). However, by claiming that the “*intellectus progressus*” as such is dependent on phantasms, Genua expressly departed from Simplicius, who restricted this dependence to the practical intellect.

Genua thought that the rational soul is moved by the “*intentiones imaginatae*” (*In de anima*, 130ra), but he rejected the idea that sensory representational devices may determine the contents of intellectual cognition. When the phantasy forms the phantasm of a stone, for example, this is at best an occasion for the agent intellect to

provide the possible intellect with a “*species lapidis*,” produced by virtue of one of its own ideas (*In de anima*, 145vb-146ra).

On the basis of a detailed analysis of the concept of illumination in Latin, Arab, and Greek commentators, Genua concluded that an intellectual apprehension of natural reality does not presuppose that the (agent) intellect endows sensory representations with a capacity to move the (possible) intellect; it only means that the intellect projects itself onto the material world (*In de anima*, 155rb). Both nature and scope of human cognition are dominated by the agent intellect, which perfects the progressing intellect by virtue of its forms or species, the mental presence of which is compared to that of images in a mirror (*In de anima*, 144vb). The sensory images are just occasional causes for the acquisition of knowledge (*In de anima*, 155rb). Hence, the intellect does not receive anything from the phantasms, nor does it endow them with a special capacity.

Genua developed an innovative view of mental representation which anticipates later occasionalist and innatistic accounts of the acquisition of knowledge. In his cognitive psychology, the intelligible species served as the basis for the connection between the human soul and the separate intellect, as well as for our knowledge of the sensible world. Genua rejected the traditional view of the species as accidental representations originating from perceptual capacities. Since only innate contents (which may be characterized as species, notions, or ideas) ensure intellectual knowledge of material reality, self-knowledge is the source of all empirical knowledge. The role of the phantasms in cognition is nonetheless crucial. The mind needs to be incited to generate actual cognitive representations of material reality; moreover, there is no such thing as an intellectual memory. In sum, then, mental acts consist in the mind’s projecting itself onto sensible reality.

In a continuous polemic with Agostino Nifo and Pietro Pomponazzi, Genua argued that psychology neither belongs to metaphysics nor to natural philosophy and is a *scientia media* in the strict sense of the word, for which he uses the term *scientia animastica* (*In de anima*, f. 4va). On the one hand, the psychologist is supposed to study

the intellectual soul from a natural point of view, insofar as it depends on sensory images. On the other hand, his job is to study the active intellect from a transcendental point of view, as a subsisting and immaterial intelligence (*In de anima*, f. 5rb). Genua attempted to give psychology an independent, intermediary status, but he did not succeed in safeguarding the unity of the *scientia animastica* (Bakker 2007).

Marc Antonio Genua took a special place in the Aristotelian psychological tradition, a position we may call sense-dependent nativism: cognitive acts express innate contents, but they occur only when triggered by sensory representations. The human mind grasps material reality by means of representations; these representations are already present potentially, but they require corresponding phantasms to be actualized. This idea of the human mind as “applying itself” to the capacities of the body will return, in a different context, in Descartes’ psychology of cognition (Spruit 1999).

Geocentrism

Pietro Daniel Omodeo

History of astronomy and philosophy, Max

Planck Institute for the History of Science, Berlin, Germany

Abstract

“Geocentrism” refers to a cosmological and planetary theory, in which the Earth occupies the central position of the world system. In antiquity and in the Middle Ages, geocentrism was the most common cosmological view, although some astronomers and philosophical schools embraced alternative visions about worldly order. During the Renaissance, debates following Nicolaus Copernicus’s proposal of a heliocentric planetary theory prompted a reexamination of traditional geocentric (and geostatic) arguments (see “► [Copernicanism](#)” and “► [Astronomy](#)”). This also led to their

reworking and expansion. Aristotle’s and Ptolemy’s arguments were attentively reconsidered. Many scholars deemed them conclusive and therefore stuck to terrestrial centrality even after parallax computation (in the 1580s, especially Tycho Brahe) and telescopic evidence (after 1610, especially Galileo Galilei) demonstrated the impossibility of geocentric paths for Mars and the inferior planets. Geo-heliocentrism thus emerged as the only viable solution. It was a planetary theory according to which all or some of the planets rotate around the Sun, while the Sun remained Earth centered along with the Moon and the fixed stars. The Inquisition prohibition of Copernican astronomy in 1616 gave new impetus to geocentrism, in its geoheliocentric form, among Catholics.

The Aristotelian Legacy

Aristotle’s arguments in favor of terrestrial centrality, especially those in *De coelo* II 12–13, were particularly influential during the Middle Ages and the Renaissance. They were especially due to Aristotle’s acknowledged authority and to their integration in a systematic vision of nature. In particular, geocentrism was compatible with the elemental theory according to which the four sub-lunary elements – earth, water, air, and fire – are ordered according to a concentric scheme beneath the sphere of the Moon (the first of the celestial bodies). They were thought to have innate tendencies to move toward their “natural places.” According to this doctrine, the earth, as the “heaviest” element, strives toward the cosmological center, which coincides with the center of gravity.

Against this philosophical backdrop an ad hoc explanation had to account for the fact that the *orbis terrarum* – the three continents, Africa, Asia, and Europe – was not submerged in the water. During the Middle Ages, this explanation was sought in the providential intervention of God at the moment of the Creation. In the sixteenth century, the oceanic explorations and the discovery of continents thus far unknown to the

Europeans – especially the so-called antipodes – undermined traditional cosmography and proved the fundamental unity of the *globus terracquaeus* (the earthly watery globe). This new evidence and its theoretical consequences for geography were a mortal blow to medieval cosmology, as astronomical innovators such as Copernicus stressed. The latter mentioned the epistemic discontinuity in geographical knowledge in his first book of *De revolutionibus orbium coelestium* (I 3) in order to make his heliocentric theory acceptable in spite of its novelty. Copernicus claimed that astronomy ought to be emended just like geography.

In spite of Copernicus's claim, the Aristotelian tradition lived long after him, as witnessed by the countless editions and commentaries of Sacrobosco's standard textbook, which began with reference to the theory of the elements and the "two-physics" distinction between the sublunary realm of corruption and the quintessentially incorruptible heavenly realm. The most authoritative Renaissance commentary on this book was composed by the Jesuit mathematician Christoph Clavius. It was widely circulated during the Renaissance, especially as a textbook for the teaching of spherical astronomy at Jesuit colleges.

The Ptolemaic Legacy

By far the most important astronomical defense of geocentrism from antiquity is Ptolemy's. The Hellenistic astronomer, who was still regarded as the "prince of astronomy" during the Renaissance, refutes the eccentricity of the Earth in *Almagest* I 5 (standard modern numbering). He bases his objection on considerations of how a hypothetical displacement of the Earth in different directions would alter celestial phenomena. He considers in particular the cases of terrestrial eccentricity on the equatorial plane or along the rotational axis. A "third" case, that the Earth is neither on the axis of the daily rotation nor on the equatorial plane, cumulates the disadvantages of both dislocations. Therefore Ptolemy only mentions it but does not treat it extensively.

Concerning the first case, Ptolemy argues,

If we imagined [the Earth] removed towards the zenith or the nadir of some observer then, if he were at *sphaera recta* [at the equator], he would never experience equinox, since the horizon would always divide the heavens into two unequal parts, one above and one below the Earth; if he were at *sphaera obliqua* [at an arbitrary latitude], either, again, equinox would never occur at all, or [if it did occur], it would not be at a position halfway between summer and winter solstices, since these intervals would necessarily be unequal, because the equator, which is the greatest of all parallel circles drawn about the poles of the [daily] motion, would no longer be bisected by the horizon; instead [the horizon would bisect] one of the circles parallel to the equator, either to the north or to the south of it. (Toomer 1984, p. 41)

Ptolemy additionally observes that, if the Earth were "removed towards the east or west of some observer," the sizes and the distances of the stars would be different at eastern and western horizons. Moreover, the time intervals between rising and culmination and between culmination and setting would be unequal.

In the second case – that the Earth is displaced along the axis toward the north or the south – the plane of the horizon would divide the heavens into unequal parts for any observer (at the equator or at any other latitude). Furthermore, the shadows of sundials would be altered. At equinoxes the shadows of a gnomon at sunrise and at sunset would not form a straight line in a plane parallel to the horizon.

These were the main Ptolemaic arguments for geocentrism based on geometrical reasoning and empirical evidence. According to Ptolemy a displacement of the Earth from the center would not be compatible with the heavenly phenomena. Copernicus and the supporters of the heliocentric system solved these inconveniences by simply assuming that the dimensions of the annual "orbit" of the Earth around the Sun are negligible relative to the distance of the starry heaven, as stated in *De revolutionibus* I 5.

Copernicus's claim about the *immensitas* of the heavens persuaded only a few among his contemporary and immediate followers. Particularly revealing of the post-Copernican endurance of geocentrism is Erasmus Reinhold's edition with commentary of the first book of the *Almagest*

(1549¹). This was a textbook directed to Wittenberg students. In it, Reinhold not only explained and illustrated the Ptolemaic arguments but also expanded and strengthened them. He appreciated Copernicus's mathematics but not his violation of acknowledged physical principles.

Ancient and Medieval Alternative Systems Reassessed

Ancient and medieval scholars also produced cosmologies that were neither geocentric nor geostatic. In *De coelo* II 13, Aristotle reported the Pythagoreans' worldview as one such case. According to them, a "fire" occupies the center of the cosmos. Based on this reference, there was a tendency in the early reception of Copernicus to ascribe his system to Pythagorean forerunners. However, there was no compelling evidence that their "central fire" corresponded to the Sun nor that the terrestrial rotation around the center referred to the annual revolution. Aristotle only reported that the Pythagorean model could account for the same celestial phenomena as geocentrism:

Most of those who hold that the whole Universe is finite say that it lies at its center, but this is contradicted by the thinkers of the Italian school called Pythagorean. These affirm that the center is occupied by fire, and that the Earth is one of the stars, and creates night and day as it travels in a circle about the center. . . . Since the Earth's surface is not in any case the centre, they [the Pythagoreans] do not feel any difficulty in supposing that the phenomena are the same although we do not occupy the centre as they would be if the Earth were in the middle. For even in the current view [that is, geocentrism] there is nothing to show that we are distant from the center by half the Earth's diameter. (Aristotle 1986, p. 217)

A proper heliocentric theory had to wait until the third century BC, when Aristarchus of Samos developed and defended it as a viable astronomical thesis. Archimedes referred to it in *The Sand Reckoner*. He asserted that he could express the number of grains of sand encompassed by Aristarchus's cosmos in a handy manner through a new numerical system solving the major

shortcomings of Greek mathematical symbolism. This reference to Aristarchus's cosmos is a hint at the conspicuous enlargement of the world implied by the passage from a geocentric to a heliocentric theory, as a consequence of the fact that terrestrial revolution produces no observable stellar parallax. Several Renaissance scholars perceived this difficulty as insurmountable. In particular, the "useless" vastness of the space between Saturn and the fixed stars looked impossible to critics of heliocentrism such as Brahe, and this formed part of their criticism against heliocentrism.

It should be stressed that the thesis of the motion of the Earth is not incompatible with geocentrism. Among others, Plato defended geokinetic geocentrism: in *Timaios* 40b–c, he ascribed to the Earth the axial rotation as the cause of the succession of days and nights. In the fifteenth century, Nicholas Cusanus argued for terrestrial motion in the second book of *De docta ignorantia*. In the following centuries, the thesis of terrestrial centrality-cum-mobility was endorsed by several scholars, among whom were the imperial mathematician Nicolaus Raimarus Ursus in *Fundamentum astronomicum* (1588), the Brandenburg mathematician David Origanus in his ephemerides and Brahe's pupil Christian Longomontanus in *Astronomia Danica* (1622).

During the Middle Ages geocentrism was never cast into doubt. It was linked to theological conceptions of divine Providence and Creation, as witnessed in Dante Alighieri's synthesis of late-medieval thought in the *Divina Commedia*. The Earth rested at the center as the place of change and corruption, encircled by the ethereal perfection of the heavenly spheres surrounded by the empyrean heaven, which was the abode of the blessed souls and the contemplating God. Planetary order was less standardized. In the twelfth century Andalusia al-Bitruji argued for the sublunary location of Mercury and the superlunary of Venus in his work of homocentric astronomy, *Book on Astronomy*, which had large dissemination among Jewish and Latin philosophers. Medieval commentaries on Macrobius, Pliny the Elder, Martianus Capella, and Calcidius also displayed qualitative heavenly diagrams in which planetary

motions are not perfectly circular or the two inferior planets encircle the Sun instead of the Earth. The latter model (geocentrism with heliocentric paths for Mercury and Venus), ascribed in antiquity to Herakleides of Pontus, became known as the Capellan system. Copernicus would refer to the diverging opinions of his ancient and medieval forerunners in the beginning of *De revolutionibus* to claim his right to an independent and innovative inquiry into this matter:

Therefore, having obtained the opportunity from these sources, I too began to consider the mobility of the Earth. And even though the idea seemed absurd, nevertheless I knew that others before me had been granted the freedom to imagine any circles whatever for the purpose of explaining the heavenly phenomena. Hence I thought that I too would be readily permitted to ascertain whether explanations sounder than those of my predecessors could be found for the revolution of the celestial spheres on the assumption of some motion of the Earth. (Copernicus 1978)

Post-Copernican Geocentrists

The mathematical reception of Copernicus never implied adherence to heliocentrism as a physical reality. At Wittenberg, one of the most important irradiating centers of his astronomical work, the leading intellectuals opposed this realist option. Martin Luther is reported to have reacted with skepticism to the new system because it was in contrast with the Bible. Philip Melanchthon condemned Copernicus's hypotheses on the basis of natural-philosophical considerations. In his and the philosopher Paul Eber's introduction to physics, *Initia doctrinae physicae* (*Introduction to Physics*, 1549), the Copernican theory was rejected and its teaching was prohibited.

The Wittenberg mathematician Reinhold was enthusiastic about Copernicus's geometrical models, for they respected the so-called astronomical axiom (celestial motions are circular and uniform about their centers). In his manuscript commentary on Copernicus, *Commentarius in opus Revolutionum Copernici*, he hinted at the possibility of accepting his devices without

renouncing geocentrism. However, he could not complete his geocentric revision of Copernican astronomy due to an untimely death.

Reinhold's follower as a professor of mathematics in Wittenberg and Melanchthon's son-in-law, Caspar Peucer continued his "translation" of the Copernican models by showing that his model for the precession and the trepidation of the starry heaven could easily be adapted to a geocentric frame. Far from a conventionalist approach to astronomy, that is to say, an approach only interested in "saving the phenomena" without any consideration about the physical tenability of the models employed by the astronomers, his and his master's efforts bear witness to a shared desire to reconcile physics and mathematical astronomy. Peucer's astronomical hypotheses, or "hypotyposes," published anonymously in Strasbourg in 1568 (as *Hypothypothes*) and then with the author's name in Wittenberg in 1571 (*Hypotheses astronomicae, seu Theoriae planetarum*), exerted a conspicuous influence on the cosmological and philosophical post-Copernican debate at the end of the century. The Strasbourg mathematician Conrad Dasypodius carried out the first anonymous edition. In the preface he ascribed this work to Reinhold reinforcing the conviction, among learned scholars, that the author of the *Prutenicae tabulae* was also the designer of a geocentric revision of Copernicus, the details of which had not yet been developed.

Among those who reworked *De revolutionibus* with a geocentric perspective, the Silesian mathematician Paul Wittich occupies a special place. In two preserved copies of *De revolutionibus*, he developed geometrically equivalent planetary models, which varied Copernicus's theory. In these diagrams he illustrated how to pass from Sun-centered models to equivalent Earth-centered ones. Those displaying the "theory of the three superior [planets] accorded with the immobility of the Earth" are accompanied by a claim for authorship: "I found this new genre of hypotheses on 13 February 1579." Wittich also accommodated the inferior planets within a geocentric (and

geostatic) framework, remarking that “[...] Copernicus’s theory of the two inferior [planets] can be in agreement with the immobility of the Earth, in accordance with Ptolemy’s words.”

Wittich’s geometrical considerations acquired a strong physical meaning a decade later when geoheliocentric systems proliferated, following the seminal publications by Ursus and Brahe, who were both acquainted with the ideas of the talented Silesian mathematician. However Ursus’s and Brahe’s models were slightly different. The former maintained that the central Earth rotates producing the apparent daily rotation of the heavens. In Brahe’s system, the solar and Martian “orbits” intersected. The reason he gave for this intersection was the alleged observation, in 1582, of a Martian parallax larger than that of the Sun. This demonstrated that the planet is closer to the Earth in opposition. Ptolemy could not explain this proximity, as Brahe explained in a writing, *Apologia de cometis* (*Apology on [My Theory of] Comets*), directed to the Scottish mathematician John Craig (1589). He added that only two systems could account for it, namely the Copernican or a geoheliocentric one. The latter, however, presupposed that the heavens are fluid. Hence, Brahe attached great importance to the observation of comets demonstrating that celestial bodies freely traverse cosmic space:

Hence, there is no doubt that Mars is closer to the Earth in opposition than the Sun can ever be. Thus, the ancient Ptolemaic hypotheses, which were accepted up to present, can never agree with reality. By necessity, either the Earth accomplishes an annual revolution and the Sun is immobile at the center of the universe, as Copernicus asserted with conviction in modern times; or—if this appears to be absurd, as it is—there remains no other possible system (*hypothesium conformatio*) than that which we have introduced. [...] From these considerations it is sufficiently clear that I did not reject the reality of the [celestial] spheres with temerity. In fact, if the Earth has to be immobile, [the parallax of] Mars implies this consequence [i.e., the rejection of the solid spheres], so that no impossible penetration of the Solar sphere occurs. (Brahe 1972, p. 475)

These publications of the late 1580s triggered off a polemic over the priority in the “discovery”

of geoheliocentrism that lasted more than one decade. Even Kepler was co-opted by Brahe in his struggle for the recognition of his priority. Brahe required him to write against Ursus as a condition for his appointment in Prague as his assistant in 1600. Brahe was notoriously jealous of his theory and deemed other scholars dealing with it without appropriate reference to his authorship to be plagiarizers. For instance, in 1591, after he was informed that the Scottish mathematician Duncan Liddel was teaching his theory to Rostock and Helmstedt students, he accused him of unduly appropriating his doctrines, as emerges in his correspondence with Kepler (2001, pp. 91-92.).

The geo-heliocentric theory was long lived. In northern Europe, Brahe’s pupils picked it up, in particular Longomontanus who proved one of the most strenuous opponents to Kepler’s heliocentric-and-elliptical planetary theory. After the Inquisition prohibited heliocentrism, geoheliocentrism remained the only system a Catholic astronomer could adhere to. Students of Jesuit Colleges were taught the details of this theory alongside anti-Copernican arguments. A telling document of this anti-heliocentric resistance is the extensive refutation of the Copernican system in the second volume of Giovanni Battista Riccioli’s *Almagestum novum* (*New Almagest*, 1651). The author embraced a hybrid system. According to this Jesuit astronomer, the two inferior planets plus Mars encircle the Earth while the Sun, the Moon, Jupiter, Saturn, and the sphere of the fixed stars turn about the cosmologically central Earth.

Geography in Renaissance Sciences

Andréa Doré

Universidade Federal do Paraná, Curitiba, Brazil

Abstract

Geography in the early modern period is part of cosmography. Geography is defined as a graphical representation of the whole known world, a description of the Earth. In the context of Renaissance, the knowledge about the Earth spreads essentially through cosmographic treaties or cosmographies, maps, and travel accounts. These three genres dialogue, influence each other, and have specific forms of combining different traditions then existing in order to obtain and describe the knowledge about the Earth surface. Three main sources of knowledge are identified: the classical heritage; the Christian tradition; and the information brought by new discoveries. The different ways of understanding and describing the Earth, either from a physical, cosmological, astronomical, and mathematical point of view or as an inhabited world, are articulated throughout the sixteenth century and the result is that the Earth becomes a homogeneous body and a specific object to Geography.

Heritage and Rupture with the Tradition

Geography in the early modern period is part of cosmography. This term generally refers to the study of the entire universe, including the central spheres of the four elements (earth, water, fire, and air) as well as the peripheral sphere of the planets and stars or as found in several texts: the earthly world, corruptible and the celestial world, incorruptible.

The conformation of the cosmos in the sixteenth century follows the classical tradition of Aristotle and Ptolemy, based on Geocentrism (Debus 1978; Ptolemy 2000; Dalché 2009). The

Earth is a stationary planet at the center of the universe, surrounded by the orbit of the other planets and the sun and by the spheres of the other three elements: water around the earth, air, and finally fire. The geocentric system is revised by Nicolaus Copernicus (1472–1543), who proposes a heliocentric system, also called Copernican system. The theory is explained in his work *De revolutionibus orbium coelestium*, published in 1543, year of his death. The sun is at the center of the same system of planetary spheres, in which the Earth takes his place. In this system, the Earth performs a daily rotation in a circular orbit around the stationary sun. The work of Copernicus opened a discussion for alternatives to the classic geocentric worldview, which were developed by Tycho Brahe (1546–1601), Johannes Kepler (1571–1630), Galileo Galilei (1564–1642), and Isaac Newton (1642–1727). However, heliocentrism would only replace the geocentric theory of the universe in the late seventeenth century.

In the context of Renaissance, the knowledge about the Earth spreads essentially through cosmographic treaties or cosmographies, maps, and travel accounts. The cosmographies, written both in Latin and in vernacular languages, have their “golden period” between 1540 and 1575 but continue to be published and reissued throughout the seventeenth century (Lestringant 1991). During the sixteenth century, the two terms – Cosmography and Geography – were often used indiscriminately. Having the work of Ptolemy, the “Prince of cosmographers,” as his primary reference, Pierre Apian, author of one of the first cosmographies of the sixteenth century, *Cosmographie*, which had ten issues between 1529 and 1584, produced an explanation about the differences between “Cosmography,” “Geography,” and “Chorography.” “Cosmography” refers to the system of spheres and the projection of the starry sky onto the earth’s surface, which delineates the earth with the help of celestial coordinates; “Geography” describes the terraquaeus sphere on the basis of larger features such as mountains, seas, and rivers; and “Chorography,” or “Topography,” offers detailed depictions of individual places such as cities, towns, and harbors (Vogel 2006,

470). Apian also proposed an analogy that became famous: Geography, representation of all the Earth, would be the equivalent of the drawing of a head, while Chorography or Topography would be the ear or the nose and would consider only particular places.

In the sixteenth and seventeenth centuries different terms are used to designate Earth, indicating semantical as well as lexical inaccuracy: *terra*, *sphaera*, *orbis*, *orbis terrarum* (Latin translation from the Greek *oikoumenē*), *terra habitabilis*, *mundus*. The diversity of designations is linked to the fact that the knowledge of the Earth does not bind only to the field of Geography but also of Astronomy, Physics, and Theology (Besse 2003).

In addition to the cosmographies, two other genres of documents register and circulate the geographic knowledge: travel accounts and the cartographic production. These three genres dialogue, influence each other, and have specific forms of combining different traditions then existing in order to obtain and describe the knowledge about the land. In the first place is the classical knowledge. From antiquity, according to François Dainville, would come three legacies: one scientific, one literary, and one practical (Dainville 1940).

The scientific or mathematic tradition, based on Ptolemy, has as main objective to determine where the places on Earth are and teaches how to draw maps. The rediscovery of the work of Ptolemy by Christian Europe was fundamental to the organization and expansion of the geographical knowledge of the West in the modern period and the term "Geography" reappears in Europe as a result of the circulation of his work. Ptolemy, a native of Alexandria, active around 140 AD, wrote his major work *Geographia* in eight books. The first two contain principles for the making of maps; and the other six books list the latitude and longitude of about eight thousand locations of the then known world. In 1406 the work is translated into Latin by Jacopo Angelo de Scarperia (Jacobus Angelus), who offers it to Pope Gregory XII and after to Alexander V (Buisseret 2003, 16). The first printed edition containing maps

produced according to the instructions and lists of locations of Ptolemy is made in Bologna, in 1477.

Another tradition, more literary, historical, and descriptive, painted the man and his actions on the surface of the Earth, as Strabo did. His work, entitled *Geographica*, highlighted by educators and travelers, and produced between 7 BC and 18 AD, does not include maps but brings detailed descriptions of countries and cities. The text was known in Europe in late Middle Ages, several copies survived dated since twelfth century and in 1469 appeared the first printed Latin translation. It prioritizes the quality of the described places, the historical and human aspects; it highlights the singularities and has an encyclopedic character. In this same tradition are Pomponius Mela, Pliny the Elder, and his *Natural History* and Solino.

And a third tradition, inherited from the practical thinking of Aristotle and the Stoic philosophers, studied the world according to the four states or elements of matter: earth, water, fire, and air.

The European maritime discoveries and the evidence regarding the possibility to navigate other seas and find inhabitants in all the lands that the ancients did not know reflect in the reorganization of the discipline of Cosmography and Geography. Through travel accounts, written by conquerors, adventurers, missionaries, settlers and merchants, new information arrives in Europe about the land and its inhabitants. Classic knowledge starts to be confronted by experience, characterized by direct observation. These two sources of knowledge – *Auctoritas* and experience – are defined and described in different ways by scholars.

It is in the coexistence of these different influences that the problematic character of definition or of identity of the discipline of Geography in the period between 1450 and 1650 concentrates, characterized by "continuity and change" (Woodward 2007, 3).

In the context of Geography there is, then, in this context, what Jean-Marc Besse called a "system of tensions, but also of articulations, or

even hierarchies, into the same global scientific culture (...), between different epistemic rationalities” (Besse 2003, 13). Put in another way, it refers to two epistemologies that can be simplified in the attitude of two agents: on one side the office cosmographer, erudite humanist, reader of Latin and Greek, devoted and carrying the classic knowledge but attentive to new discoveries; and the traveler, pilot, or explorer who left Europe and used the own eyes as main tool, source of legitimacy of collected knowledge (Bowen 1981). The products of both epistemologies were not necessarily incompatible and the updated maps of chief-cosmographers were also used on board.

Geography associates with History in Renaissance. The two disciplines are considered complementary and very useful. Grown men and women could, through Geography, know the places where history happens; statesmen and administrators could understand the customs and ambitions of their neighbors; and merchants would know where to find the largest consumption goods and exotic products. Many authors take up variations of the phrase of Abraham Ortelius, which synthesizes the interdependence of the two disciplines: “Geography is the eye of History” (*Historiae Oculus Geographia*), inserted in the preface of his *Theatrum Orbis Terrarum*, from 1570, and as the epigraph of his work *Parergon*, in 1592.

The Geography of the sixteenth century was the object of publications which became canonical. The invention of printing was, in this respect, a key factor for the dynamics of information circulation brought from antiquity and those obtained through the most different discoveries. Among the growing number of cosmographers and cartographers throughout the sixteenth century, stand out Sebastian Münster, author of *Geographia*, a reissue of Ptolemy, from 1540, and his own *Cosmographia* from 1544; Abraham Ortelius and his aforementioned monumental *Theatrum Orbis Terrarum*, from 1570; and Gerard Mercator, creator of the cartographic projection which bears his name and is until today adopted and the introducer of the term “atlas”, in

1595, with the work *Atlas sive cosmographicae meditationes de fabrica mundi e fabricati figura*. These editions are fed by the growing volume of news brought by travelers and gathered in editions that translate and compile travel reports. Some became famous in the sixteenth century, such as Fracanzo Montalbodo’s *Paesi novamente ritrovati*, from 1507; Giovanni Battista Ramusio’s *Navigazioni e Viaggi*, from 1556–1606; Richard Hakluyt’s *Principal Navigations*, 1589–1600, and Théodore de Bry’s *Grands Voyages*, from 1596. These works were often reissued and added, and at their side a large number of texts and maps of lesser impact arose, evidencing the importance geographic knowledge acquires throughout Renaissance.

The different ways of understanding and describing the Earth, either from a physical, cosmological, astronomical, and mathematical point of view or as an inhabited world, are articulated throughout the sixteenth century. The result is that the Earth becomes a homogeneous body and a specific object to Geography (Besse 2003, 377).

George of Trebizond

Born: 1396, Crete, Greece

Died: 1474, Rome, Italy

Pier Davide Accendere

Humanities Department, University of Eastern Piedmont “Amedeo Avogadro”, Vercelli, Italy

Abstract

George of Trebizond (1396–c. 1474) – Greek émigré; Byzantine scholar and polemist; translator of Plato, Aristotle, and other Greek works; and renowned teacher of rhetoric and Latin eloquence – was one of the most enigmatic and controversial humanists of the fifteenth century. In the intellectual history of Western culture, George of Trebizond is best known as one of the major protagonists of the Plato-Aristotle quarrel through his *Comparatio philosophorum Aristotelis et Platonis* (1458), a work written against Platonism and its revival at that time. In particular, George was a severe opponent of Gemistus Pletho and – consequently – his student, Cardinal Bessarion. His scholarly interests included rhetoric and logic; and his handbooks in these two disciplines (*Rhetoricorum libri V* and *Isagoge dialectica*) circulated widely in Europe.

Biography

In the *De Antiscii* (1454), George of Trebizond provides the following autobiographical sketch: “I believe it escapes none of my acquaintances that I am a Greek born in Crete and married to a wife from there and that together with her and the children now for almost 35 years I have wandered unwillingly through alien cities far from my homeland. For who willingly leaves the fatherland where he was born, where he was brought up, from where he married his wife, where he had his children? I left nonetheless forced by the envy of some powerful men and tormented by the severe injuries their arrogance caused me. I departed with my wife and, at the time, one daughter, and hired by the people of Vicenza, I taught school for almost 2 years. Again I was forced to leave because of the conspiracy of some men. I proceeded to Venice where for about 12 years I lived in the fairness and justice of that people longer, I believe, than my innate unhappiness would bear. When I therefore left it as well, I travelled to Bologna where I stayed almost a year and then came to Florence. Three years later, I followed the Curia to Rome” (Monfasani 1976: 9).

George, whose family came originally from Trebizond, a Greek city on the Black Sea, was born in 1396 on the island of Crete. He arrived in Italy around 1416 at the invitation of the Venetian humanist Francesco Barbaro. In Venice George studied Latin at the school of Guarino da Verona. In early 1417 he moved to Padua, where he met Francesco Filelfo and Bishop Pietro Marcello. While there George perfected his knowledge of Latin with Vittorino da Feltre, whom he would later praise as his main teacher of Latin: “But now I call you, Vittorino. Protect and defend what is yours. Whatever Latin I know, I owe to you, my teacher, after God [. . .] You have many witnesses, patricians and good men who as youths studied under you in Venice at that time [. . .] For years it has been well known to everybody that you

considered me not merely your pupil but also your son” (Monfasani 1976: 12). In this period George was both a pupil and an assistant in the Vittorino’s school. He “aided Vittorino in reading the *Gorgias* and corrected the Greek passages in Vittorino’s copy of Nonius Marcellus. Moreover, he introduced Vittorino to the untranslated rhetorical works of Hermogenes of Tarsus. In return, Vittorino molded Trebizond into one of the best Latin stylists of the early and mid-Quattrocento” (Monfasani 1976: 12–13).

Thanks to the good offices of Francesco Barbaro, in 1420 George moved to Vicenza, where he taught for an entire year. From 1421 to 1423, he lived in Venice again, eventually returning to Vicenza in 1423 as a public teacher of Latin. In 1426 George converted to Catholicism, and at the end of 1427, he was expelled from Vicenza for reasons that are still not clear. After a short stay in Crete, in 1431 he resided in Mantua and then returned to Venice in 1433. In 1437 George followed Pope Eugenius IV and his court to Bologna; in a letter to Pietro Barbo (the future Pope Paul II), he wrote: “Therefore, as soon as you left [Venice] for Bologna [to go] to your uncle Eugenius IV of happy memory, I placed all my hope after God in you. Leaving Venice, I came to you at Bologna and by your efforts was honorably appointed to lecture publicly there” (Monfasani 1976: 34). During his sojourn in Bologna, Trebizond wrote a letter to the Byzantine Emperor John Paleologus and the *Oratio de laudibus summi pontificis Eugenii IV*. After the departure of Eugenius IV to Ferrara for the Council of Union, from 1439 to 1440, George and his family moved to Bagno di Romagna, where he found a post in the house of Gherardo Gambacorta as a tutor for his children. Furthermore, Trebizond wrote the *Isagoge dialectica* and dedicated it to Pietro Gambacorta, who was his own pupil and the son of Gherardo.

In 1440 George decided to move to Florence, the new seat of the ecumenical council and the cradle of the *studia humanitatis*. The bookseller Vespasiano da Bisticci wrote about his presence and scholarly activity in Florence: “He lectured in the time of the [papal] court, where he was much honored, thought of, and prized. Since the court of

Rome was here at the time, he had a great audience in Florence and lectured in public and in private, in his own house, in several subjects, and in Greek and in Latin, and in logic and in philosophy; he produced a *Dialectics* so that his students could learn [logic] and likewise he produced a *Rhetoric* which was much honored. He used to give his students many exercises. At this time *there was not in Florence a more useful man than he for teaching*, in addition to his learning and eloquence, since he was ‘eloquentissimo.’ He sent his fame throughout all of Florence and in the court of Rome; he was much honored and esteemed by all, and especially for beginning to translate [Greek]” (Monfasani 1976: 41).

In 1443, still during the pontificate of Eugenius IV, George left Florence and relocated to Rome. In the Eternal City, he met the greatest humanists of his age (Lorenzo Valla, Poggio Bracciolini, Nicholas of Cusa, etc.), and he worked in the service of no fewer than five different popes: Eugenius IV (1431–1447), Nicholas V (1447–1455), Calixtus III (1455–1458), Pius II (1458–1464), Paul II (1464–1471), and Sixtus IV (1471–1484). Appointed apostolic secretary in 1444, he maintained the office of *scriptor litterarum apostolicarum* until 1450. His privileged status at the Roman Curia enabled him to devote more time to his studies and translations, including that of Aristotle’s *libri naturales*. Under the papacy of Nicholas V, a patron of Roman humanism, George held the office of lecturer at the Studium Romanum. In addition to Aristotle (*Historia animalium*, *De partibus animalium*, *De generatione animalium*, *Problemata*), he turned his attention to translating other authors: John Chrysostom (*Nonaginta homiliae in Matthaëum*), Eusebius (*De praeparatione evangelica*), Cyril of Alexandria (*In Iohannem*), Ptolemy (*Almagest*), Gregory Nazianzenus (*De laudibus s. Basilii*; *De laudibus s. Athanasii*), and Gregory of Nyssa (*De perfecta hominis vita*).

In 1452, after his fight with Poggio Bracciolini, George resolved to leave the papal curia and move to Naples under the patronage of King Alfonso of Aragon. In his “Neapolitan period,” Trebizond produced Latin translations of Cyril of Alexandria’s *Thesaurus de sancta et consubstantiali trinitate* and of ps.-Ptolemy’s *Centiloquium*. Furthermore,

he wrote two astronomical pamphlets (*Brevis de antiscii tractatus* and *Cur his temporibus astrologorum iudicia fallant*) and probably began his well-known invective *In perversionem Problematum Aristotelis a quodam Theodoro Cage editam et problematice Aristotelis philosophie protectio*. George severely criticized Gaza's translation of Aristotle's *Problemata*. His attack is a defense of both Aristotelianism and the scholastic tradition: "the *Protectio* is George's defense of scholasticism and especially of Dominican scholasticism. [...] Moreover, of all the scholastics, the only ones whose works he specifically quoted by name were Albert the Great and Thomas Aquinas [...]. It was not only the profound Aristotelianism of the two Dominican doctors which especially appealed to Trebizond, but even more so their sophisticated attempt to reconcile Aristotle with Christ" (Monfasani 1976: 156).

After the fall of Constantinople in 1453, George composed two important treatises in Greek: *On the Truth of the Faith of Christians to the Emir* and *On the Divine Manuel, Shortly to be King of the Whole World*. He addressed these works to the sultan Mehmed II, conqueror of ancient Byzantium, giving him the controversial title of "King of Kings": George "warned Mehmed [...] that God had given him the city of the universal Christian monarch Constantine in order that he might emulate Constantine and unite all men under one scepter and one religion. Trebizond then demonstrated how Islam and Christianity could be reconciled. This amounted to converting Mehmed to Christianity" (Monfasani 1976: 131).

In 1455, following the election of Pope Calixtus III, George returned to Rome and resumed the office of apostolic secretary. In 1458, George completed his most important work, titled *Comparatio philosophorum Aristotelis et Platonis*. In 1460, under the pontificate of Pius II, George moved to Venice. After offering his Latin translation of Plato's *Laws* to the Venetian Republic, he was appointed as the teacher of eloquence at the Rialto school. In this regard, the Venetian chronicler Marin Sanudo writes as follows: "In August [1460] Giorgio Trabesonzio came to this land and presented to the Doge Plato's book *The Laws*, translated by him from Greek into Latin. He was

hired to lecture in the city on the humanities with a salary of 150 ducats per annum" (Monfasani 1976: 145). In 1462, after an obscure scandal, George returned to Rome once again, where he remained until 1465. During these years he benefited from extraordinary ecclesiastical patronage. More specifically, he received support from three preeminent clergymen: Cardinal Prospero Colonna, Cardinal Nicholas of Cusa, and Jean Jouffroy, Bishop of Arras. In return, George dedicated his translation of Aristotle's *Problemata* to Prospero Colonna. In late 1458, Nicholas of Cusa commissioned him to translate Plato's *Parmenides*, the *magnum opus* of the Neoplatonist tradition. Finally, between 1455 and 1459, he dedicated his translation of Aristotle's *Physics* to Jean Jouffroy.

In 1464 Pietro Barbo, Trebizond's pupil, became pope as Paul II. Understandably, George regarded Barbo's election as an extraordinary opportunity. In his preface to the *Questiuncula de vita Ioannis* and the *De questione Hieronymi et Augustini super legalibus*, he addressed the newly elected pope: "A good while back, Most Holy Father, I had decided that in my old age, I would try my meager powers at elucidating some passages in Scripture which seemed especially ambiguous [...] But ill-health, as frequent as it was serious, so depressed and enfeebled me that I gave up the project. But in these days, aroused solely by your assumption to the apostolate, I have written little treatises on two questions [...]" (Monfasani 1976: 179). George dedicated various religious writings to the new pope: a treatise on Jn. 21: 22; *De sanctificatione matris domini ab utero*; *De questione Hieronymi et Augustini super legalibus*; and *De trepidatione domini* (now lost).

In 1465 he left Rome for Constantinople in hopes of convincing Mehmed II "The Conqueror" to make an agreement with the Christian West. After a brief stop in Crete, he reached Constantinople in November. Once there, George wrote the *Isagoge ad Almagestum Ptolomei*: "Mehmed felt no special admiration for Italian humanism. But he was interested in scientific astronomy because of its identification with astrology; and in approaching Mehmed, George stressed his scientific astronomical knowledge as much as his humanistic accomplishments" (Monfasani 1976:

188). Unfortunately, in 1466, Trebizond left Constantinople without having met the Sultan and accomplishing his goals. While sailing from Byzantium, he wrote *On the Eternal Glory of the Autocrat*, which he dedicated to Mehmed II. Then, still during the return voyage, two significant events led him to write two more works. First, while in Corfu George met Nicholas Seminopolios, a Greek priest, and discussed Gregory Nazianzenus' oration *In Theophania* with him. Once back in Rome, Trebizond sent Seminopolios a letter on this theological topic. Second, during this return trip, the boat on which he traveled was caught up in a frightening storm. George then swore that if he survived, he would write a biography of the martyr Andreas of Chios: "in the spring of 1465 at Constantinople, Andreas of Chios had been apprehended, wrongly, he protested, as a renegade Moslem. He endured 10 days of public torture before dying on 29 May 1465" (Monfasani 1976: 189).

In June 1466 George was back in Rome, where a wrathful pope awaited him. After learning of the *Eternal Glory* dedicated to the Sultan Mehmed II, Paul II had the treatise put under investigation. For this reason, concerning the apostolic secretaryship, George activated the right of resignation to his son Andreas that he had received in 1457. In October 1466 George was imprisoned at Castel Sant'Angelo, but was released in February 1467. Once free again, he tried to establish relations with the Hungarian court. To this end, he presented some of his translations to Matthias Corvinus, king of Hungary, that is, Ptolemy's *Almagest* and St. Basil's *Adversus Eunomium* and *De spiritu sancto*. These two works were sent to John Vitez, archbishop of Gran and Hungarian chancellor, and to Ianus Pannonius, bishop of Pecs, respectively. George "saw in Budapest a waystation on the road to Constantinople. Trebizond hated Islam even more than he admired Mehmed II. Accordingly, he could only applaud Corvinus' resistance to the Turk. Trebizond hoped that Corvinus could hold back the Son of Ishmael until he himself returned once more to Constantinople to convert him" (Monfasani 1976: 199).

In 1471, Cardinal Francesco della Rovere, a Franciscan theologian, was elected pope as Sixtus

IV. George's life came to an end under his pontificate. In his *Elogia veris clarorum virorum litteris illustrium* (1546), Paolo Giovio wrote: "It is said that George reached an extreme (*exacta*) old age, so that he became a child again and almost lost his mind, forgetting a great deal. He used to go about the City by himself in a worn out cloak and cap, supporting his wobbling steps with a badly gnarled staff" (Monfasani 1976: 233). Nevertheless, it was precisely in this period that George's printed works enjoyed great diffusion. Among his most popular writings were his Latin translation of Eusebius' *De praeparatione evangelica*, *Rhetoricorum libri V*, and *De partibus orationis ex Prisciano compendium*.

George of Trebizond died in Rome in 1474. He was buried in the Dominican church of S. Maria sopra Minerva (for further information about George's life and works, see also Monfasani 1984, 2017; Viti 2001; Ganchou 2008; Abenstein 2014; Linde 2017).

Pletho and Trebizond in the Plato-Aristotle Controversy

Consisting of three books, the *Comparatio* was a part of the Plato-Aristotle controversy, which featured Gemistus Pletho (*De differentiis Aristotelis et Platonis*) and Cardinal Bessarion (*In calumniatorem Platonis*) as the main participants. Attacking Pletho's Neoplatonic drift and Bessarion's intellectual circle, George criticizes Plato's philosophy as a dangerous contagion and an enemy of Christian orthodoxy. Also, he upholds Aristotle's philosophical system, praising it for its compatibility with Christian doctrine (Bydén 2013: 147–150; see also Schulz 2010). In Book III he does not hesitate to depict what he considers the Platonic threat using an apocalyptic tone: "Depraved Platonic hedonism corrupted the Roman Empire and in the end brought it to ruin. At the same time, the Platonists had a hand in all the heresies which beset the early Church. Thereafter, a second Plato arose: Muhammed. Muhammed learned his hedonism from a monk who was expelled from Alexandria because of his Platonic ideas and morals [...] and who eventually came across Muhammed in Ethiopia [...]."

However, being much more sensible than the first Plato, Muhammed purged this instruction of its perversions and added practical rules of conduct. Consequently, after the perverse philosophy of the first Plato had enervated Byzantium from within, the devotees of the second and astuter Plato conquered it from without. Now a third Plato has appeared, more sensible than the first and more learned than the second: Gemistus Pletho, the apostle of a revived paganism. His clever books and ideas are now spreading to Europe. If unchecked, they will undermine Latin Christianity. George therefore called upon the Latin clergy and upon all those who honor the Saviour to do their duty. If they do not, he warned, a fourth Plato will come and overpass all previous 'Plato's' in spreading the creed of *volutas*" (Monfasani 1976: 158–159).

Trebizond's Contribution to Natural Philosophy and Astronomy

In his groundbreaking essay *George of Trebizond's Contribution in the Development of Cosmology During the Renaissance*, George Steiris illustrates the historical background, diffusion, and legacy of George of Trebizond's astronomic work through a rigorous and precise synthesis. George Steiris writes that "the contribution of Greek scholars, those who fled to Western Europe in order to escape the advancing Ottomans, was great. These scholars brought manuscripts, until that date mostly unknown in the West, providing the western intellectual circles with new, more accurate translations of the already known ancient literature" (Steiris 2008: 185). In this specific historical context, Trebizond's contribution to natural philosophy and to astronomic studies was particularly significant. He was not only a translator but also a commentator on important scientific works. Among his most important translations are Aristotle's *De generatione et corruptione*, *De caelo*, *De anima*, *De historia animalium*, *De partibus animalium*, and *De generatione animalium*; Ptolemy's *Magna Compositio* (*Almagest*); and ps.-Ptolemy's *Centiloquium*. In particular, Trebizond "was confident that" his astronomical works "would correct old mistakes and contribute to the enrichment of cosmological thought" (Steiris 2008: 191).

Trebizond's interest in cosmology probably developed under the influence of Paulus Venetus (1368–1429) (Monfasani 1976: 347; Steiris 2008: 186), and "after the death of Paulus Venetus, George continued to deepen his knowledge in cosmology for several years, before his first attempt to write something of his own" (Steiris 2008: 187). The translation of *Almagest*, commissioned by Nicholas V (1451), was the major contribution of Trebizond to the development of the astronomic studies, and he also dedicated a commentary to the famous Ptolemaic work. This *Commentary*, "which he almost immediately considered his *opus magnus*" (Steiris 2008: 189), consists of two parts: the first part exposes and clarifies some basic concepts; the second part, instead, contains comments (Steiris 2008: 189). Then Trebizond commented also pseudo-Ptolemy's *Centiloquium*: "in the prologue [...], George claimed that his cosmology was based on Aristotle, while at the same time he gave an account of some of the most basic Aristotelian cosmological views" (Monfasani 1984: 99; Steiris 2008: 193).

In 1465 Trebizond brought his translation and commentary of the *Almagest* to Constantinople, hoping to win the favor of Sultan Mehmed II, but his attempt failed: "having a high interest in Ptolemy the Sultan was displeased realizing that the available text was full of mistakes and omissions" (Steiris 2008: 194). In 1467 Trebizond suffered another failure, this time at the Hungarian court of Matthias Corvinus. Indeed, here Trebizond clashed with the work of Regiomontanus, his great adversary and Bessarion's *protégé*; particularly Cardinal Bessarion fiercely criticized and defamed Trebizond's translation and commentary of the *Almagest*. Regiomontanus continued Peurbach's intellectual heritage by writing a polemical work (hitherto unpublished) against Trebizond's commentary: the *Defensio Theonis contra Trapezuntium*. "Regiomontanus had declared that his plan was to publish his *Defensio* [...], in the hope of exposing George's erroneous beliefs to a larger audience" (Steiris 2008: 196).

Trebizond's astronomic work did not achieve the expected success, but we entirely agree with the conclusion of George Steiris: "Without

George of Trebizond and Regiomontanus, Ptolemy's authentic thought would have probably remained in the darkness, making astronomy and philosophy of nature to follow a totally different course" (Steiris 2008: 197).

Rhetorical Work: Heritage, Innovative Aspects, and Legacy

As is well known, rhetoric and logic were crucial to Trebizond's thought (see, for instance, Lojacono 1985; Classen 1993; Mack 2011; Guerra Caminiti 2004; Calboli Montefusco 2012). The *Rhetoricorum libri V* (on rhetoric) and the *Isagoge dialectica* (on logic) are his major handbooks: "When George of Trebizond arrived in Venice in 1416 at the age of 21, he knew no Latin and very little, if any Italian. Thirty years later he was acknowledged as one of the foremost teachers of Latin eloquence in Italy; and for the next 100 years, that is, until about the mid-sixteenth century, his handbooks in rhetoric and logic enjoyed a European diffusion of enormous proportion" (Monfasani 1976: 241). His work relied on three distinct rhetorical traditions: the Greek and Latin heritage, on the one hand, and Byzantine culture, on the other. Among Greek and Latin authors, the following were particularly important to him: Aristotle, Demosthenes, Hermagoras, Dionysius of Halicarnassus, Cicero, Quintilian, Marius Victorinus, and Martianus Capella. With regard to the Byzantine legacy, Hermogenes of Tarsus (A.D. 161–180) stands out as his main source. The revival of the Hermogenean model, largely through George's efforts, played an important role in the development of rhetorical studies in the Latin West. The addition of Hermogenes' corpus proved significant for Renaissance scholars both from a doctrinal and a methodological point of view: "The obvious result of the Byzantine rhetorical tradition was that most educated Byzantine visitors to Renaissance Italy felt an immediate kinship with the style and interests of the Italian humanists. George of Trebizond was a Greek humanist before he became a Latin humanist. The task he eventually set himself was to combine the Byzantine and Latin of rhetoric; and we can trace the development of that plan from George's first opuscula to its final

fruition in the *Rhetoricorum libri V*" (Monfasani 1976: 255). The sincere effort to combine Ciceronianism (i.e., the foundation of Western rhetorical tradition) and Byzantine education underlies George's rhetorical program (see Classen 1993). His originality in rhetoric and logic is not to be found in his breaking away from tradition but in the attempt to bring together different cultural strands: Greek, Byzantine, and Latin (including scholasticism). Paradoxically enough, he was at once a humanist and a passionate defender of medieval scholasticism. The same is true of his writings in logic: the *Isagoge dialectica* "inaugurated the series of humanist Logics. With its formula of a simplified logic put at the service of the *ratio topica*, it served as the model for the manuals of Giorgio Valla, John Caesarius, Melanchthon, Vives, and Ramus" (Monfasani 1976: 316). George considered logical doctrine crucial to any humanist's rhetorical skills. Yet, it is important to note that in this field, he did not try to develop an alternative to scholasticism or carry out any thorough reform of it (Monfasani 1976: 328–329). His respect for that tradition is shown by his reliance on a set of basic principles taken specifically from late scholastic logic.

Major Trebizond's Prefaces, Works, and Translations

Prefaces: Prefaces to King Alfonso of *Rhetoricorum libri V*, *Protectio Aristotelis Problematum*, the translation of Aristotle's *Rhetoric*, the translation of Cyril of Alexandria's *Thesaurus*, the translation of Demosthenes' *Oration on the Crown*, the translation of ps.-Ptolemy's *Centiloquium*, the commentary on ps.-Ptolemy's *Centiloquium*; preface to Andreas Trapezuntius of *De partibus orationis ex Prisciano compendium*; preface to an anonymous addressee of the translation of Demosthenes' *On the Crown*; preface to an unidentified *vir clarus* of the translation of the ps.-Aristotelian *Problemata*; preface to Antonius de Pago of the translation of Aristotle's *Physics*; preface to Cardinal Bessarion of the translations of St. Basil's *Contra Eunomium* and *De spiritu sancto*; preface to Cardinal Domenico Capranica of the translation of Aristotle's *De anima*; preface

to Francesco Barbaro and the Venetian Republic of the translation of Plato's *Laws* and *Epinomis*; preface to Francesco (de Lignamine) de Padua of the translation of Aristotle's *Rhetorica*; preface to Jacopo Antonio Marcello of the commentary on Ptolemy's *Almagest* and the *Comparatio*; preface to Ianus Pannonius of the translation of St. Basil's *De spiritu sancto*; preface to Jean Jouffroy of the translation of Aristotle's *Physics*; preface to Ioannes Vitez of the translation of St. Basil's *Adversus Eunomium*; preface to Cardinal Ludovico Trevisan of the translation of St. Gregory Nyssen's *De vita Moysi*; preface to Mehmed II of the *Isagoge* to Ptolemy's *Almagest*, the translation of Ptolemy's *Almagest*, and the *Comparatio*; preface to King Matthias Corvinus of the commentary on Ptolemy's *Almagest*; prefaces to Pope Nicholas V of the translation of John Chrysostom's *Homiliae* 26–88 in *Matthaeum*, the translation of Eusebius' *Praeparatio evangelica*, the translation of Cyril of Alexandria's *Super evangelium Iohannis*, the translation of Aristotle's zoological works, the translation of Plato's *Laws* and *Epinomis*, and the translation of two orations of St. Gregory Nazianzenus; preface to Cardinal Nicholas of Cusa of the translation of Plato's *Parmenides*; preface to Pope Paulus II of two theological treatises; preface to Petrus Gambacurta of the *Isagoge dialectica*; preface to Cardinal Prospero Colonna of the translation of Aristotle's *Problemata*; preface to the Reader of the *Rhetoricorum libri V*; preface to the Reader of the translation of Aristotle's *De anima*; preface to the Reader of the second part (*Expositio*) of the commentary on Ptolemy's *Almagest*; preface to Vittorino da Feltre of the commentary on Cicero's *Pro Q. Ligario*.

Speeches: *Oratiuncula* in praise of the Bishop of Padua; *Oratio de laudibus Ciceronis*; *Oratio de laudibus eloquentie*; *Oratio de laudibus summi pontificis Eugenii Quarti*; *Oratiuncula* on King Alfonso of Aragon; *The Response* to Guarino da Verona; *Protectio Aristotelis Problematum* against Theodore Gaza; exhortations to King Alfonso of Aragon and Emperor Frederick III to recover the Holy Land; exhortation to Pope Nicholas V *ad defendenda pro Europa Hellesponti claustra*; funeral oration for Fantino Michiel.

Rhetorical and dialectical works: *Rhetoricorum libri V*; *De artificio Ciceroniane orationis pro Q. Ligario*; scholia to Aristotle's *Rhetoric*; *Isagoge dialectica*; *De partibus orationis ex Prisciano compendium*.

Religious works: Prologue to Bk. IV of Basil's *Adversus Eunomium*; scholia to St. Basil's *Adversus Eunomium* and *De spiritu sancto*; scholia to Gregory Nazianzenus' orations *De laudibus S. Basilii* and *De laudibus S. Athanasii*; *On the Truth of the Faith of Christians*; *On the Eternal Glory of the Autocrat*; *On the Divinity of Manuel*; On John 21:22 to Pope Paul II; *De questione Hieronymi et Augustini super legalibus* to Pope Paul II; *De sanctificatione matris domini nostri ab utero* to Pope Paul II; *Martyrologium Beati Andree de Chio*.

Philosophical works: *Comparatio philosophorum Aristotelis et Platonis*; scholia to Aristotle's *Physics*; scholia to Aristotle's *De generatione et corruptione*; scholia to Aristotle's *De anima*; scholia to Aristotle's *Historia animalium*, *De partibus animalium*, and *De generatione animalium*; scholia to the Aristotelian *Problemata*; *Notae philosophicae*.

Astronomical-astrological works: *Commentaria ad Claudii Ptolomei Magnam Compositionem*; *Isagoge* to Ptolemy's *Almagest*; commentary on ps.-Ptolemy's *Centiloquium*; *Brevis de antiscii tractatus et cur his temporibus astrologorum iudicia fallant*.

Translations: Aristotle's *Rhetorica*, *Physics*, *De generatione et corruptione*, *De caelo*, *De anima*, *De historia animalium*, *De partibus animalium*, *De generatione animalium*; ps.-Aristotle's *Problemata per species collecta*; St. Basil the Great's *Adversus Eunomium* and *De Spiritu Sancto*; Cyril of Alexandria's *Super evangelium Iohannis* and *Thesaurus*; Demosthenes' *Oratio pro Ctesiphonte (De Corona)*; Eusebius Pamphili's *Praeparatio evangelica*; Gregory Nazianzenus' *Oratio de laudibus S. Basilii* and *Oratio de laudibus S. Athanasii*; Gregory Nyssen's *De perfecta hominis vita sive de vita Moysi*; John Chrysostom's *Homiliae XC in Matthaeum*, hom. 26–88; Plato's *Laws*, *Epinomis*, *Parmenides*; Ptolemy's *Magna Compositio (Almagest)*; ps.-Ptolemy's *Centiloquium*.

Gerondi, Nissim ben Reuben

Born: 1310 or a little after, probably in Gerona, though possibly in Barcelona

Died: 1376, Barcelona

Shalom Sadik

Ben Gurion University of the Negev, Be'er Scheva, Israel

Abstract

Rabbi Nissim Gerondi was the leading Jewish Spanish juridical scholar between 1350 and 1376. He was in fact the spiritual and the juridical leader of the Jewish community of Aragon despite apparently not having an

official position as rabbi of the city but only as head of the local Yeshiva. The huge majority of his works relate to Jewish Law. His major philosophical work was a collection of 12 sermons that address several philosophical and religious questions. His major philosophical impact was with regard to the question of political philosophy. He employed a sharp division between the law of the Torah and the law of the king, with each having distinct religious and practical roles. Rabbi Nissim was also the founder of a specific school within Jewish philosophy which continued until the middle of the fifteenth century. The defining characteristics of this school were its anti-Aristotelian approach and its conservative answers to metaphysical questions.

Alternative Names

Gerondi, Nissim; Rabeinu, Nissim; RaN; HaRaN

Biography

Nissim's family hailed from Cordova in Andalusia. He was probably born between 1310 and 1318 in Gerona, but it is also possible that he was born in Barcelona. He spent most of his life in Barcelona and was the head of the Yeshiva (Jewish school) of the city, one the most prestigious yeshivot in the medieval period. Nissim was also the main spiritual leader of the community and acted as the head of the Jewish tribunal (without having an official position as the chief Rabbi of the city). He was arrested probably due to internal strife within the Jewish community, but we do not know the exact reason for the arrest. His two major students were R. Isaac bar Sheshet (1326–1408) and R. Hasdai Crescas (1340–1410/11).

Works

- I. His main juridical work is a commentary on the *Sefer Hahalakhot* of Rabbi Isaac Alfasi (the RiF), who had based this legal code on his reading of the Talmud. The RaN's

commentary refers to the following 15 Talmudic tractates: *Shabbat*, *Pesahim*, *Bezah*, *Rosh Ha-Shanah*, *Yoma*, *Ta'anit*, *Megillah*, *Sukkah*, *Ketubbot*, *Gittin*, *Kiddushin*, *Shevu'ot*, *Avodah Zarah*, *Hullin*, and *Niddah*. Some other commentaries such as on *Mo'ed Katan* and *Makkot* are attributed to Nissim, but they were actually not written by him. It is possible that the original work did indeed include all of the Talmud's tractates, but only the aforementioned 15 commentaries have survived.

- II. Juridical responsa: We know that Nissim wrote around 1,000 responsa, but of these only some 70 are now extant.
- III. Commentary on the Talmud: Nissim composed a commentary on the Talmud, probably on the majority of the tractates. However, there are currently only published editions of *Nedarin*, *Gittin*, *Niddah*, *Hullin*, *Bava Me'zia*, *Shevu'ot*, *Rosh Ha-Shanah*, *Avodah Zarah*, *Mo'ed Katan*, *Bava Batra*, *Eruvin*, *Pesahim*, and *Sanhedrin*.
- IV. Twelve sermons: Collectively, this is his main philosophical work (Nissim 1996).
- V. Commentary on the Torah: R. Nissim apparently began this project at the end of his life, for there is only his commentary on Genesis up to 22:22, where it abruptly ends (Nissim 1958).

Most Salient Opinion

The most known philosophical idea of Nissim is the distinction between the Law of the Torah and the Law of the king, the latter of which he maintained can at times justifiably go against the strict letter of the Torah. This is the case, according to Nissim, because the Law of the Torah is so completely perfect that in many cases it is highly problematic to act exactly according to this perfect law. Some modern researchers see in Nissim's distinction between divine and royal law the possibility for carving out space for secular law in a religious world. For instance, according to the Law of the Torah, it is almost completely impossible to meet all the prerequisite conditions for giving a death sentence. However, Nissim believed that the death sentence option is crucial for sustaining public order. He therefore argued that the king has the right to put people to death by

decree, even if the decree lies outside the legal parameters laid down by the Torah. So while the Law of the Torah is the representation of the ultimate truth, nonetheless, the practical political situation of human beings requires something less than perfect law.

Impact and Legacy

R. Nissim was the founder of a specific school of thought which continued to exist for more than two generations after his death. The originality of this school lies in its merging of ideas normally viewed as being atypical of the medieval Jewish philosophical tradition, namely, (1) true philosophical inquiry (but not Aristotelian-conformist), (2) a degree of opposition (explicit or not) to the Kabbalah, (3) conservative responses to metaphysical questions, and (4) aspects of Christian scholasticism. The synthesis of these four positions makes Nissim's school not only unique but also distinct from both the philosophical and Kabbalist schools.

The main members of this school were Nissim, his two main students, namely, Hasdai Crescas and Isaac bar Sheshet, and Hasdai's disciples: Josef Albo, Josef Haviva, Zerachia Halevi, Mattathias ha-Yizhari, and Abraham bar Yehuda.

Gessner, Conrad

Born: 16 April 1516, Zurich

Died: 13 December 1565, Zurich

William M. Barton

Ludwig Boltzmann Institut für Neulateinische Studien, Innsbruck, Austria

Abstract

Conrad Gessner numbers among Switzerland's most celebrated polymaths. Best known for his work as a bibliographer and zoologist, Gessner was also a gifted philologist, botanist, and paleontologist, whose contributions to these fields – and many more besides – were widely recognized in his lifetime. As a teacher, scholar, and physician, Gessner's rich network of acquaintances and correspondents made him one of the best-connected intellectuals of early modern Zurich. Gessner's work in both recovering ancient knowledge and advancing contemporary understanding of the natural world made for a remarkable scholarly profile even in the mid-sixteenth century. The reception of Gessner's work and his approach especially in Switzerland established a tradition of natural historical research which extended to figures

such as Johann Jakob Wagner (1641–1695), Johann Jakob Scheuchzer (1672–1723), Albrecht von Haller (1708–1777), and beyond.

Alternate Names

Biography

Conrad Gessner was born into a humble family. His father was a furrier from Solothurn, while his mother was a niece of Zurich's Grossmünster chaplain Johannes Frick. Gessner went to live with his great uncle at the age of five and it was here that Gessner's education began (Leu 2016). By 1526 Gessner was living in the house of his teacher Oswald Myconius and taking classes from figures belonging to Zurich's intellectual elite, including Thomas Platter, Theodor Bibliander, Johann Jakob Ammann, and Rudolf Collin (Simmler 1566). In 1531, he received a bursary to study under reformer Huldrych Zwingli. The outcome of the Second War of Kappel in the same year was a personal tragedy for Gessner, who lost both his father and his mentor Zwingli among Zurich's dead (Leu 2006; Mähly 1879).

Without further support in Zurich, Gessner – now 16 – embarked on a studentship which saw him travel widely throughout central Europe. He went first to Strasburg and later to the Universities of Bourges and Paris, supported by a stipend from Zwingli's successor Heinrich Bullinger (Leu 2016). Once again in Switzerland, and after 2 years teaching in Zurich, Gessner was made Professor of Greek at the Academy in Lausanne. The 3 years Gessner spent in Lausanne teaching Greek and furthering his botanical interests in the surrounding landscape were happy (Olivier 1951). But by 1540, at the suggestion of his friend Christoph Klauser, Gessner moved first to

Montpellier and a year later Basle to complete his medical degree (Braun 1990; Fischer 1967).

The years following Gessner's qualification as a doctor and his subsequent return to settle in Zurich saw the beginning of his intensive scholarly production. Gessner had already published a number of works, reworking the Greek–Latin dictionary of Guarino Favorino in 1537 and writing a *Libellus de lacte et operibus lactariis*, to which was attached his famous *Epistola de montium admiratione* (1541a), for example. Now, however, he focused on philological studies and especially on lesser-known Greek authors. He made a translation of Michael of Ephesus' commentary on Aristotle (1541b) and the first Latin translation of Stobaeus' *Anthology* (1543), for example, alongside a number of studies and editions of ancient works on medicine, botany, and natural history (Müller 2016). By 1545, the first of Gessner's great encyclopedic projects came to fruition with the publication of his *Bibliotheca universalis* (1545–1549), the first universal bibliography of all Latin, Greek, and Hebrew authors known at Gessner's time, including biographical data for each entry (Gessner 1545; Sabba 2012). This enormous undertaking brought Gessner's name to Europe-wide renown (Fueter 1964; Riedl-Dorn 1989).

The next 12 years saw Gessner appointed to the position of Professor at Zurich's Carolinum (1546), city doctor (1554), and finally to the position of canon at Zurich's Grossmünster (1558), which would provide him with a stable income until his death. Throughout this period Gessner was able to dedicate himself to a number of large-scale projects on an impressive range of subjects. Between 1551 and 1558 he worked on the publication of his *Historia animalium* (Gessner 1551, 1554, 1555a, 1587), the work for which he was best known by his contemporaries (Friedrich 1995; Leu 2016). The project aimed to provide detailed information on all known animals, including woodcut images of each species. The *Mithridates* (1555b) represents the sum of Gessner's linguistic learning. It brings together contemporary knowledge on 110 different languages and dialects – including several languages

from the New World – and attempts explain their interrelationships (Colombat and Peters 2009; Peters 2016). The planned *Historia plantarum* was interrupted by Gessner's death and survived only in his beautifully self-illustrated manuscripts until its eventual publication in the eighteenth century. The work was to constitute Gessner's contribution to the then thriving field of botany, one of his lifelong interests (Leu 1992; Nyffeler 2016).

Gessner succumbed to the plague in 1565. At the time of his death he was recognized internationally as one of Europe's leading polymaths (Wolf 1577). Gessner still enjoys renown as a philologist, bibliographer, zoologist, botanist, and physician, but thanks to the initiatives celebrating 500 years since his birth in 2016, his lesser-known work in the fields of paleontology, mineralogy, and theology (to name but a few) is now being appreciated (Leu et al. 2008; Leu and Ruoss 2016).

Gessner's published works number over a hundred titles, excluding posthumous editions and prints. An attempt was made to compile a comprehensive bibliography of Gessner's publications in 1984 (Wellisch 1984).

Gilbert, William

Born: Colchester 1544

Died: London 1603

Monica Ugaglia
University of Florence, Florence, Italy

Abstract

William Gilbert is among the founders of the scientific experimental method. In particular, due to his treatise *De Magnete*, he is regarded as the father of magnetism.

Biography

William Gilbert (or Gilberd) was born on May 24, 1544, at Colchester (Essex, England). In 1558 he moved to Cambridge and entered St. John's College, where he obtained the degree of Doctor of Medicine in 1569. Around 1573 he moved to London, where he successfully practiced medicine and was elected president of the Royal College of Physicians. In 1601 he was appointed physician-in-ordinary to Queen Elizabeth I, and on her death in March 1603, he was appointed physician to King James I. He died on December 10 of that year. Of Gilbert we know two scientific works: a treatise on electricity and magnetism – *De Magnete, Magneticisque Corporibus, et de Magno Magnete Tellure* (On the Magnet, Magnetic Bodies, and the Great Magnet Earth), published by the author in 1600, and a collection of minor essays on natural

philosophy, *De Mundo Nostro Sublunari Philosophia Nova* (New Philosophy about our Sublunary World), published in 1651 by Gilbert's half brother.

Impact and Legacy

While *De Mundo Nostro Sublunari* had a very little impact, due to the *De Magnete*, Gilbert became one of the most known scientists of his day, considered by Galileo one of the founders of the experimental method, and went down in the history as the father of magnetism.

In fact, Gilbert's treatise was the first attempt of collecting in a scientific study all the known observations concerning magnetism, which were previously scattered in nautical and medical treatises, books on minerals, and collections of folk tales. Except for the nautical observations, prompted by the need of correctly using the magnetic compass, hardly ever the other available empirical data were scientifically reliable. In medicine, for example, the lodestone – namely, iron oxide – was supposed to indicate whether a woman were cheating or not, but his virtue was impeded by the garlic; books on minerals spoke of various kinds of magnet: one attracting iron and another, also called theamedes, only repelling it. The contrasting action of diamond was considered too. But mythology was the richer reservoir of magnetic facts, like the existence of statues floating on the air by virtue of an underlying magnet or of magnetic islands, which tearing off their nails forced ships to sink.

Gilbert accurately texted the magnetic-related claims, disproving some of them as rumors and trying to give a common explanation for the remaining ones. His final aim was to demonstrate that, like any other celestial body, also the Earth has a magnetic soul, or astral form, that orders and ties together its parts. Connected to the inner form, a magnetic virtue spreads from the geometrical center of the Earth, and spherically distributes around it, like around any lodestone, causing it to attract magnetic and ferrous bodies and arranging them in accordance with it. In this perspective all the known phenomena concerning the power of lodestone are analyzed and differentiated from

the ones due to the amber, which for the first time he calls electrical.

Even if Gilbert is still regarded as the father of magnetism, it is now clear that, as it is often the case, his work on magnetism was not a bolt from the blue. Leaving aside the few ancient observations – Thales of Miletus, for example, knew that magnetite attracts iron and that rubbing amber would make it attract such lightweight objects – and the very important but isolated appearance of the *Epistola de magnete* (Letter on the Magnet), composed in 1269 by Petrus Peregrinus de Maricourt, containing a significant number of scientific magnetic experiments, we got evidence of a widespread scientific debate on magnetism in the years just before the publication of the *De Magnete*. This debate was centered around the figure of the Jesuit Leonardo Garzoni, whose unpublished *Trattati della Calamita*, written around 1580, was well known to Della Porta and through his *Magiae Naturalis* (The Natural Magic, 1589), to Gilbert.

Giles of Viterbo

Born: Viterbo 1469

Died: Rome 1532

Daniel J. Nodes

Department of Classics, Baylor University, Waco, TX, USA

Abstract

Giles of Viterbo (1469–1532), prior general of the Augustinian Hermits, cardinal, church reformer, candidate for the papacy during papal Rome's golden age, responded enthusiastically to that age's renewed impulse toward classical and patristic learning. He remains a complex figure for scholars because of the many posts he held and the diverse cultural traits his thought exhibits. Contrasting elements in his life, public and private, active and contemplative, secular and spiritual, competed for his attention. Like many of his contemporaries, Giles had a deep interest in discovering the harmony of Christianity with ancient religious philosophical and traditions, both directly and as mediated through Greek and Latin patristic authors like Origen and Augustine, Ficinian Platonism, and Hebrew mysticism.

Synonyms

Egidio da Viterbo; Aegidius Viterbiensis

Biography

Giles of Viterbo (also known as Egidio da Viterbo or Aegidius Viterbiensis) was born in 1469 in Viterbo, a city at the foot of Mount Cimino in Tuscany. His parents were Lorenzo Antonini and Maria del Testa. Little is known of his youth, but the details offered in Giuseppe Signorelli's biography of Giles have been generally followed, including the suggestion that Augustinian friars were among Giles's early teachers in Viterbo and that a famous Augustinian preacher, Mariano da Genazzano, who visited Viterbo in 1485, influenced Giles to join the Augustinian Hermits in 1488 (Signorelli 1929, 2). In 1489, his discernment year for the order, he was sent to Amelia in Umbria to teach philosophy. The following year he resumed his studies, not in Viterbo but at the college of Saints Philip and James, the Augustinian *studium generale* in Padua, a center of humanism, Averroistic philosophy, and Thomistic theology. Giles did not remain neutral within that philosophical diversity; for while in Padua he published three treatises of Giles of Rome, including *De intellectu possibili contra Averroem*, which has been seen as Giles's first stand against Averroistic Aristotelianism, a position he would hold through the rest of his life (O'Malley 1968, 41). There is no record of precisely when he was ordained to the priesthood.

Giles also attended lectures by Agostino Nifo, the physician and philosopher who taught at the University of Padua from 1492 to 1499. From Nifo he was already learning to develop a broader philosophical outlook by being exposed to Platonic ideas and lore from the mystical teachings attributed to Hermes Trismegistus. After Padua, Giles went to study with Marsilio Ficino in Florence, probably during the winter of 1494–1495, and further cultivated Platonic theology against Aristotelianism and Aristotle's Arabic commentator Ibn Rushd (Averroes), whose writings had been translated into Latin in the thirteenth century.

By 1497, Giles's Platonic reading of Christian theology was in evidence at Rome during his examination for the *magisterium*, i.e., teaching license, in theology. His range of experience continued to widen. He rose to prominence as an

orator and in 1498 preached before Pope Alexander VI. He was living in Naples between 1499 and 1501, at first seeking a solitary life but eventually becoming a member of Giovanni Pontano's literary circle, where he also worked to present Christian doctrine to his colleagues by using analogies drawn from classical poetry and mythology and Plato's dialogues. He also composed Italian lyrics and started working on an extended prose work in the vernacular titled *Cyminia*, after the fashion of Masuccio Salernitano's trendsetting *Novellino*, published in 1476. Marc Deramaix (Deramaix 1990a–1991) has shown how Giles influenced the poet Jacopo Sannazaro, also a member of the Pontanian circle.

On witnessing political intrigue in Naples, Giles resolved to return to the north of Italy, staying with the friars of Lecceto near Siena in 1503. He continued to study the classics, decorating his writings with abundant classical quotations. He considered it no detriment to Christian revelation to use classical analogies when illustrating God's dealings with the human race. Giles's modern biographer, Francis Martin, concludes that Giles was firmly committed to expounding the Christian message but wished to express himself through classical images and language (Martin, 1992, 160). Later in 1503, during a retreat on the Martana isle near Viterbo, he studied the *Iliad* and composed his own eclogues modeled after Vergil's pastoral hexameters but treating biblical themes. Over the course of his lifetime, his philosophical studies encompassed Aristotle's philosophy and scholastic theology, Ficinian Platonism, ancient Greek literature and Greek patristics, Hebrew and Aramaic, and Jewish mysticism from Elias Levita and later Baruch of Benevento. At his death in 1532, he was probably the most skilled reader of Hebrew among his European contemporaries.

His diverse interests and keen intellect cultivated in the principal cities of Italy including Rome, Naples, Florence, and Siena may overshadow but should not obscure the considerable part of his life spent in administrative and pastoral service. He was elected prior general of his order three times and served as a papal diplomat. In 1506, after his appointment as vicar general, he

again looked to the Augustinian convent at Lecceto but this time to promote his own reform efforts. His interest in scriptural studies also grew steadily, with his election as prior general in 1507 cited by Francis Martin as bringing about a kind of conversion away from the study of secular literature. When he became prior general, he had to negotiate with Martin Luther during Luther's visit to Rome in 1511.

In 1512, Giles gave the address that opened the Fifth Lateran Council. He was well on the way toward his eventual appointment as cardinal in 1517. Giles served as prior general of the Augustinian Hermits until 1519. In 1523, at the height of the West's re-enchantment with ancient Greek language, letters, thought, and art, Pope Clement VII (1478–1534) awarded Giles the Latin titular patriarchate of Constantinople. It was a solid choice, and while the appointment of a Latin patriarch was something of an affront to Orthodox Christians, Giles was a philhellene in the broadest sense of the term despite his vision for a new Golden Age under Rome. Many considered him *papabilis*, a worthy candidate for the papacy.

Giles of Viterbo is thus a complex figure partly because of the many roles he played and partly because of the diverse traits his life and works exhibit. Francis Martin's description of Giles as "a Renaissance person with none of Erasmus's disdain for relics" (Martin 1992, 61) captures both Giles's modernity and traditionalism. Owing to Italy's cultural climate, Giles was revered by some of his contemporaries for his religious and secular learning and his ability to read Christian teachings into the ancient myths. For others, however, Giles was just another paganizer of the Gospel. Similarly, despite evidence that Giles took interest in practical matters, as when in 1508 he preached to the prostitutes of Rome, he has commonly been cast as a man of ivory-tower abstractions, "a polished priest of Renaissance circles." A zealous reformer who kept his allegiance to papal authority, Giles has nevertheless also suffered from neglect in the past by Catholic historians largely because as prior general from 1511 to 1518, he was Martin Luther's superior. Francis Martin attempted to determine the proper balance among these

images, the one that corresponds closest to the documentary evidence. In any analysis, Giles is seen as a full beneficiary of the intellectual opportunities of High Renaissance Italy; what he made of them is disputed.

Heritage and Rupture with the Tradition

Throughout his life Giles's ever-expanding intellectual horizons remained connected to his formative theological training in late medieval scholasticism. "Scholasticism" represents the prevailing method in theology and philosophy in medieval European universities and religious houses of study. Scholastics approached truth through dialectical reasoning and sought to address questions of philosophy and theology systematically and to distinguish truth presented as divine revelation from knowledge derived from human reason. Aristotle's writings generally provided the philosophical foundation; but there was an effort to reconcile his teachings with the pre-Socratics, Plato, and later philosophical schools.

Giles left a record of his use of Aristotle's writings and acceptance of the Stagirate's teachings, but at the same time he expressed overt and often hostile criticism of many "errors." Letters he wrote in 1503, for example, when he was completing his disputations at Rome for the doctorate in theology, show both practices. John Monfasani has recently shown that by 1507, Giles was even preparing for publication an index of the errors of Aristotle where, working from a large miscellany of over 600 folios wherein he had itemized Aristotle's teachings, Giles had appended a topical index of the Philosopher's "errors" on matter, time, and eternity from the works indexed in the collection: *Metaphysics*, *Physics*, *De caelo*, and *De generatione and corruptione*. Giles's index project does not address Aristotle's works on the soul, logic, ethics, rhetoric and other topics, and Monfasani suggests that at the time Giles was occupied with the errors in the four works mentioned and then ordered a copy of Cardinal Bessarion's defense of Plato (the *In calumniatorem Platonis*) in preparation for the

publishing of his own *index errorum*. Monfasani then posits that after reading Bessarion, Giles considered his own project redundant and abandoned it.

During this time Giles was also busy writing his commentary on the first book of Peter Lombard's *Libri sententiarum*. His particular interest in Lombard's text, the principal textbook for theology, is also evident in a series of sermons he delivered in 1502, where he followed the division of the four books of the *Sententiae*: Book 1 on the Trinity, providence, good, and evil; Book 2 on creation, angels, demons, and the fall of man; Book 3 on redemption and virtue; and Book 4 on the sacraments and eschatology. The commentary project could have been undertaken as routine, a required academic rite of passage for all professional Catholic theologians, as it had already been for centuries. Instead it became the first of three major works of Giles which can each be considered theological and philosophical at their core. The detail of his treatment of each question is evident in his only having reached the 18th distinction of Book 1, on the Trinity. Giles worked on the *Sentences* commentary intensely from 1506 to 1510. He continued to work on it for another 2 years before administrative duties and other interests but also a general sense of having reached a conclusion of contribution to the theology of the divine Trinity, militated against continuation of that project.

Citing Aristotle as an authority but also openly criticizing him was a practice that accompanied the reintroduction of Aristotle's writings into the West, as Luca Bianchi has shown (Bianchi 1994). If refuting Aristotelianism in its *pagan* dimensions was a lifelong campaign for Giles, his formal theological and philosophical education nevertheless accommodated Aristotelian concepts as mediated chiefly by the writings of Thomas Aquinas and other scholastic theologians. The greater complexity of assessing Giles's philosophy with respect to the Thomistic tradition is evident. As mentioned, early in his theological career, Giles edited three works of Giles of Rome (ca. 1247–1316), a student of Thomas Aquinas who became the first noteworthy theologian of the Augustinian Hermits. Why did Giles of

Viterbo devote himself to Giles of Rome? Eugenio Massa interpreted Giles's intention as "to liberate theology from the systematic foundation it had under medieval Scholasticism and establish a new humanistic theology; and this may have been a factor in Giles's interest in Giles of Rome," since Giles of Rome was not completely subservient to Aquinas, but he did build on his teacher's foundation. Massa, who edited a small portion of Giles's *Sentences* commentary, considered the Viterbian's withdrawal from scholasticism in the period of his writing that treatise as gradual and only partially successful, as he judges from changes in the commentary. Massa suggested that its composition falls into three periods, as he saw reflected in the author's style and works cited. The first period would be that of the first chapters. There Giles is more elliptical, more concerned with scholastic problems. The second and the third periods produce the chapters concerning the processions of the Son and of the Holy Spirit, composed between 1509 and 1512. Massa senses an increasing reaction against scholasticism in the commentary as it progresses (Massa 1951, 37–38).

John O'Malley has pointed to Giles's interest in other Augustinian scholastics besides Giles of Rome, including Gregory of Rimini (c. 1300–1358), James of Viterbo (c. 1250 – c. 1307), and Hugolino of Orvieto (c. 1300–1373). O'Malley holds that Giles did not, contrary to what many would expect, "reject the scholastics as too tainted with Aristotle and too rigorously systematized for him to be able to tolerate." Giles, in his *Sentences* commentary and elsewhere, rather "follows in a general way the topics treated by the great scholastics, and, although his manner of argument is different from theirs, his conclusions are not so distinctive as we might have anticipated" (O'Malley 1968, 62). O'Malley even notes what he calls a strange anomaly, that as an administrator, Giles promoted the study of scholastic theology "with an insistence truly remarkable for somebody convinced that the properly Christian philosophy was that of the Ficinian Plato." Giles was sufficiently versed in scholastic categories, method, and terminology early on for it to be a component of all of his

later thought. There is still uncertainty about the degree of Giles's knowledge of the scholastics, owing to the scarcity of citations of a scholastic theologian as an authority and the apparent inability of Giles to distinguish among the detailed teachings of the various writers. Now that the complete text of the *Sentences* commentary has been published (Nodes 2010), scholars are able to search for textual parallels with Aristotle and Aquinas and compare them in detail with the many places where Giles either overtly refutes or seeks to build upon the scholastic tradition.

Here we suggest that Giles's effort was toward a broad and aspirational synthesis that included but was not subservient to scholasticism or even principally interested in it. To illustrate, the synthesis of scholastic and Platonic approaches to theological issues is especially evident in Giles's writings on the soul and its faculties such as sense perception, will, intellection, and memory. By the fourteenth century, philosophers and theologians had in large measure turned their attention away from questions about the soul and its faculties and became more interested in questions about human cognition. Faculty psychology, however, continued to prove useful as an analogy. The reintroduction of Aristotelian psychology in the thirteenth century, with commentaries on Aristotle by Muslim scholars, had brought other images to the forefront for later medieval Christians to consider when presenting the soul's faculties as analogous to the relationship among the persons in the Trinity. Aristotle's *De anima*, II.3, identifies three species or aspects of soul in succession: vegetative, sensitive, and rational, relating them to the ordered progression of numbers and geometric figures from one to the next. Aristotle's distinction among vegetative, sensitive, and rational faculties had been reflected in the writings of Augustine of Hippo but was now reintroduced to the West from a non-Christian context. The three aspects still gave Christian theologians the opportunity to develop the Trinitarian analogy.

In order to exploit the analogy's potential, two questions were mainly discussed. The first asks whether there is any proper ordering among the faculties. The second asks whether one faculty may be said to originate from another faculty.

Using analogies from nature to describe the relation of the persons in the Trinity is of limited value since it risks introducing concepts of superiority and subordination on the one hand, and the introduction of time as a factor on the other hand, thereby failing to represent the doctrine of the Trinitarian persons as coequal and coeternal, yet possessing real distinction and an order of origin among themselves.

The common solution to those limitations was to present several orderings from different perspectives. Thomas Aquinas introduced his account of the ordering of the faculties by repeating the two basic principles of order that Christian doctrine rejects as ways to understand the ordering of the divine persons in the Trinity: namely, ordering the divine persons according to their coming into being “in time” and ordering in terms of a simple causality. When he turns to consider the human faculties, he first acknowledges arguments against ordering based on origin in time, because all of the faculties are simultaneous and present in the soul from its creation. Thomas then acknowledges arguments against their ordering being one of simple causality, since “one faculty is not the subject of another faculty, because an accident cannot be the subject of an accident. Therefore, one faculty does not arise from another.” Then, to explain how their ordering can be properly understood as according to origin, Thomas presents a concept of ordering by development, where each faculty precedes that faculty which it prepares for action. Thus the nutritive powers precede the sensory, and the sensory the rational. Natural ordering, however, reverses that sequence and considers the rational powers before the sensory powers, and the sensory before the nutritive. Each faculty’s domain of influence reverses the pattern again: the domain of the nutritive is the body only and that of the sensory is the body and beyond; then there are rational faculties whose domain is data from the sensory world as well as the metaphysical realm of being. The scheme of showing multiple perspectives lays a foundation for preserving in even greater measure the dynamic aspect of the relation of the persons of the Trinity.

By Giles’s time, scholasticism was increasingly criticized as an exercise in logomachy. Philipp Melanchthon, one of the bitterest critics of scholasticism, for example, summarized the turmoil over the organic faculties responsible for sense perception as *magna et inepta* in his own *Liber de anima* (Melanchthon 1540, 36). But even Melanchthon continued to speak of will, cognition, memory, and judgment as “interior faculties” in that text. The fifteenth-century German Carthusian Gregor Reisch, author of the influential textbook *Margarita philosophica*, was another scholar who voiced the Aristotelian doctrine that “All our knowledge is derived from the senses.” He continued to speak of three sense types in his doctrine of the powers: external (the five senses), internal (serving as a bridge), and intellection (dealing with universals). Giles, like his contemporaries, treats the human faculties not as an issue in itself but insofar as their relationship to one another can serve as an analogy of the relationship among the persons of the Trinity. Particularly in commentaries on the *Sentences*, the ongoing usefulness of the faculties as a way to approach a principal mystery of the Christian faith is evident.

Giles, however, adapts elements from the Platonic myth to the general framing of the questions by Aristotelian scholasticism. He introduces a moral dimension to the discussion and shows the moral significance of a search for ordering among the faculties by invoking Book 4 of Plato’s *Republic*. Where Thomas and Aristotle appealed to logic, Giles (along with Plato) emphasized that learning the correct ordering of the faculties will prevent the soul from suffering harm and experiencing misery, because the soul will know which faculties should rule and which should serve. Plato had compared the relation of the parts of the soul to the functioning of a kingdom. In that analogy, as Giles notes, “Reason is likened to a king, soldiers to self-regard or emotion, and the populace to appetite” (Nodes ed. 2010, 203). But then Giles continues the strategy of presenting alternative orderings. For example, according to ordering of action, the senses are the first to act and they inform reason, and reason in turn stirs the will. After several orderings, Giles adds an

illustration drawn from poetry and myth, as he does at the end of every question he discusses in the commentary. Here he points to Homer's presentation of Venus/Aphrodite as the goddess representing the power of love or the human will "overcome by Athena, wounded by Diomedes, and mocked by Zeus". This reflects the ordering according to externals, which put reason and sense perception above the will. However, in Virgil, Giles writes, the divine ordering according to nature and perfection is observed, since primacy of place and *imperium sine fine* is given to the offspring of Venus, again representing love and will. Giles's main emphasis in connection with the Trinity is well served as he is able to proclaim a natural ordering of the faculties amid a dynamic relationship.

That is how Giles prepared the context to present the second question, one faculty's origin from another. As he notes, in order to reflect the Trinity, the faculties must originate one from the other, as the Son and Spirit originate from the Father. Giles asks "But how will [the faculties] present themselves as an image and likeness of the Trinity, unless one proceed from the other?" (Nodes, ed. 2010, 206). Giles recalls the Aristotelian procession or generation of one number from another and then presents a parallel case of the progression from the good, to knowledge of the good, to the desire for [love of] the good, again recalling Augustine's highest psychological analogies for the Trinity.

Using this pattern of blending Aristotelian and Platonic and scholastic and humanist traditions, Giles enriches the medieval legacy of abstract dialectic on both questions. He begins with scholastic disputation and ends with poetic exegesis. In the final analysis, he does not negate one scheme or another but reinforces a single interpretation of a tradition that connects the human soul and its divine creator amid manifold systems of expression. He also presents an eloquent lesson in happiness that comes by learning the proper ordering of the faculties.

Giles's reserved attachment to the basic structures of scholasticism continued when he wrote the *Historia viginti saeculorum*, his second major

philosophical work, and the *Scechina*, his third and last, in which he sought to reconcile Jewish mysticism with Christianity. Even toward the end of his life when his occupation with the cabbala had diminished his regard for the Latin theological tradition, Giles was still thinking in terms of the traditional scholastic categories. Many of Giles's conclusions are not so different from those derived by the Scholastics and may even have been derived from his Renaissance contemporaries like Ficino. This contributes to findings that have emerged in recent decades, showing more harmony existed between scholastic culture and at least the mid- to late Renaissance environment to which Giles belonged than previously acknowledged.

Innovative and Original Aspects

The divergent views of Giles's life and work stem from his lifelong efforts to discover in Greek myth and Jewish mysticism the same fundamental truths he found in the Bible and Christian doctrine. Giles knew that the work of cultural synthesis in which he participated was an ancient but often controversial tradition. He knew the early Greek allegorizations of Homeric myth. He knew the writings of Jewish and Christian philosophers who, influenced by Neoplatonism, interpreted the biblical account of humanity's creation in God's image as testimony to the rational soul's transcendent nature. He admired Origen's allegorical exegesis of the Bible as well as Ficino's mystical allegories. Yet Giles could not inherit a fully formed and universally accepted interpretive method for scripture, or myth, or mystical writings, for none existed. He was, moreover, a creative enough thinker to give his own interpretations to the material he chose to study. He believed that pre-Christian *arcana* held the universal truths about the human condition which were more fully revealed in the Scriptures.

Giles's *Sentences* commentary, despite its connection to scholastic categories, was nevertheless a reaction to scholasticism in an effort to restore a theology that was literary, alive, and ethical, more

like that of the patron of Giles's order, Augustine of Hippo. And although Eugenio Massa suggested that Giles only gradually became less comfortable with scholasticism late in his commentary project, Giles took a distinct stance from the earliest pages of the commentary. From the first sections of that treatise, there is a conscious application of its title *ad mentem Platonis*, which attests to Giles's commitment to a new method with mystical and poetic dimensions that grow above the dialectical roots.

Giles's voluntarism transcending natural law and his method of interpretation using grammar, myth, and allegory transcending dialectic thus reflect an eclectic humanistic perspective. In that difficult attempt at synthesis, however, there is a dominant element. In the final analysis, the method Giles prefers is literary rather than dialectical and humanistic rather than scholastic. Myth and allegory are preeminent, and Giles concludes every section of the commentary by applying them to the topic under consideration. Giles tried to bring a scholastic theological exercise like writing a *Sentences* commentary into harmony with Platonic philosophical reflection and to introduce classical myths to illustrate those theological truths. While there is some validity in the aforementioned description of Giles as "a man of ivory tower abstractions" motivated partly by a desire to display his erudition in papal court circles, he was even more genuinely a sincere promoter of Plato's philosophical idealism as the closest approximation in the pre-Christian world to Christian doctrines of the Trinity, the redemption, and the soul's natural immortality. Giles labored to inject that theological vision into a revitalized contemporary culture replete with ancient wisdom and thus again made whole (Nodes 2015). While Thomas Aquinas privileged the intellect for its ability to bring the soul to a contemplation of the divine essence which is its end, Giles, true to his Augustinian tradition, privileges the will, since it is what sets the soul in motion toward union with the beatific vision. But Giles goes further; true to his classical humanist worldview, he reads classical Greco-Roman myths in a manner so as to illustrate

what the soul's union with the beatific vision looks like, which both Peter Lombard, the scholastic father of the *Sentences*, and even Augustine, who was critical of pagan culture, would never have done.

"Eclectic" can be used to describe Giles's integrative work, but that both aids understanding and serves as an occasion for disagreement about Giles's project. Whenever that term has been taken as equivalent to "paganizer," Giles has been seen as fusing together several different forms of beliefs and practices into one system of belief. When it is taken as more akin to "harmonizer," Giles's campaign can be seen as revealing the mystery of the Trinitarian Godhead in pagan and Jewish texts. The range resembles C. J. de Vogel's taxonomy of Christianity as related to Platonism (De Vogel 1985), which spans five degrees, from total rejection to fargoing acceptance joined with transformation. In this schema, Giles fits best in the fifth category, as corroborated by Giles's own opinion of Plato as "a philosopher who indeed approaches so very closely to divine matters, so delights in them, so takes our side, that it no longer seems that it should be said about Philo that 'either Philo is speaking like Plato,' but 'either Plato is speaking like a Christian,' or more truly, 'is speaking like Moses'" (Nodes 2010, 274; Borriello-Vitale eds. 2016, 485). In his *Sentences* commentary, Giles validates aspects of ancient Hellenic philosophy's preliminary conceptions of God and God's relation to humanity. He reminds readers, for example, that the Apostle Paul had pointed out how the Greek philosophers had received revelation from God: "Paul, speaking about the Greek philosophers, interprets what God revealed to them. Wherefore what God revealed even to the philosophers was not a departure from the truth, and to those especially whose philosophy was not at odds with the knowledge of the prophets" (Nodes 2010, 112). Acceptance of that relationship does not lead Giles to equate Christian theology and ancient Greek religion but rather to discover elements of Christian meanings in the ancient Greek myths, as Gemistos Plethon had attempted to do.

Giles's syncretism is best seen as an effort to harmonize philosophical and mythical traditions with the Christian mystery, so that they are seen to bear witness to Christian revelation. Giles saw his work as finding the same truths about God, and the human soul expressed in the Bible also reflected in texts of Homer, Plato, and Vergil. As the scholastics harmonize current knowledge about Aristotle with the church fathers, so Giles harmonizes Plato, Homer, and Vergil with them. Giles, however, did not quite go as far as some of his contemporaries like Pico della Mirandola, who sought to harmonize all religious traditions, including Islam. Yet one can speculate that with a longer life and under less-threatening historical circumstances, Giles might also have looked more closely into the Koran and its tradition for those places where there could be discoverable harmony with the message of Christ.

After 1512, when Giles turned from writing the commentary on Peter Lombard, he entered his second large project in 1513, the *Historia viginti saeculorum*, dedicated to Pope Leo X. Again Giles envisaged a major undertaking, in this case a Christian interpretation of human history from beginning to end, divided into 20 periods. The autograph copy of this work (Naples, Bib. Naz., Cod. IX. B. 14) contains the subtitle "per totidem digestis psalma," reflecting Giles's intention to correlate the history of the work of divine providence in each of the ages of mankind with the verses of a psalm. Continuity with scholasticism's categories of God, creation, good and evil, angels, and final things is evident in these later works; yet Giles does not present a scientific or documentary history but rather a compendium of lore studded with moral observations. Marc Deramaix is one of the recent scholars who have shown aspects of the way in which Giles's *Historia* points out the traits of a secret divine knowledge whose truth seems perfectly corroborated by the consistent and parallel revelations he marks out in Plato, Pythagoras, Vergil, and even Etruscan lore. Scholars have long known that the Etruscan matter was culled from false information presented in the *Antiquitates* of Annio da Viterbo. Giles's *Historia*

still awaits a full critical edition although sections of the work where Giles is critical of the worldliness of Alexander VI's and Julius II's pontificates were published in 1854 by K. A. C. Höfler (1854), and extracts are printed in a history of the papacy by M. Creighton in 1887 (Creighton 1887, 279–289).

Giles worked on the *Historia* until 1518, when he turned his attention to this third large project, the *Scechina*. The word is an Italian transliteration of the Hebrew for God's glorious presence to the human race. It is the last of the ten Sefiroth, the emanations within the Godhead culminating in his presence among mankind. Giles derived this knowledge from the Cabbala "tradition," a form of gnosis that is expressed as a series of symbolic reflections on God. The Cabbala had a great influence on Giles, especially for what it was thought to reveal about the divine nature, and the interpretation of the Bible and, to a lesser but still significant degree, the coming of the Messiah. This mysticism stands against the analytical philosophy of medieval Jewish scholars, chief among whom was Maimonides, who worked to reconcile Judaism with Greek philosophy, much as did Gregory Palamas in the Christian Greek East.

Impact and Legacy

John O'Malley pointed out that Giles represented one of the last great figures in the Observantist movement that swept over the mendicant orders in the late Middle Ages. He was a well-regarded preacher and orator. He opened the fifth Lateran Council in 1512 with a maxim that sounded the fundamental norm for church reform: "Men are to be changed by religion, not religion by men" (O'Malley 1968, 14). He was on familiar terms with several High-Renaissance popes, including Leo X, by whom he was raised to the rank of cardinal. Was Giles responsible in part for the iconography of Michelangelo's Sistine Chapel ceiling or even Raphael's Stanza della Segnatura? The thesis was pioneered by Heinrich Pfeiffer and

embraced by present-day art historians including Meredith Gill and Ingrid Rowland.

For all his intellectual energy and range of talents and interests, however, Giles has remained more of a marginal figure than his deep learning seems to deserve. It could be that his great reach and eclecticism itself had less impact than if he had followed one line of inquiry more consistently. Although he was the most accomplished Western Hebrew scholar in his day, and was personally responsible for introducing the Zohar version of cabbalistic tradition to European attention, he is given less credit than deserved for being a pioneer in Hebrew studies. He practiced the kind of ecumenism with which modern Christians who are comfortable with the relative merits of world religions now take for granted.

Giles worked to bring not only the eponymous founder of his Augustinian order into greater prominence but the early church fathers in general. Giles's leadership of the Augustinian order at the start of the Protestant Reformation as precipitated by Martin Luther, an Augustinian monk himself, was once thought to be a condition for Giles to have influenced Luther's reform theology. Jules Paquier's study in the 1920s, however, found little correspondence between Luther's doctrines and Giles's. In Giles's period, however, Augustine's writings became increasingly available through the publication of printed editions along with Origen, Chrysostom, Lactantius, and other early Christian leaders. And while Roman Catholic theology gradually centered itself on Aquinas and medieval scholasticism, the movement to revive the Eastern and Western fathers, a project in which Giles participated vigorously, also made a keen impact on subsequent directions in theology and practice.

Giles was also a Hellenist in the sense that, although a champion of the Roman papacy, he promoted reform efforts that included a closer study of the Greek Fathers and the theology of the Eastern Church. "That [Greek] nation," he wrote, "in all the world has been either the discoverers or promoters of every kind of branch of learning, and they seem therefore most worthy of protection and defense rather than accusation or

summoning to trial. Further, they have been the preeminent leaders and teachers even of the Latin theological writers" (Nodes 2010, 422).

Because of the many influences and complex crosscurrents of traditions, defining Giles's principal aims and vision remains elusive. While the focus on one person may be thought to open only a small window on the history of Christianity, however, the window in this instance gives view of a larger trend in the Church's complex cultural history through this high cleric's appropriation of Ficinian Platonism and Jewish mysticism into the Roman curia during the High Renaissance and the dawn of the Reformation. Had Giles become pope or been more influential in the curia, or even had his writings been made more widely available, the course of the Protestant Reformation or Catholic efforts at counterreform might have had a different character.

Giraldi Cinthio, Giovan Battista

Born: Ferrara, 30 November 1504

Died: Ferrara, 30 December 1573

Susanna Villari

Dipartimento di Civiltà Antiche e Moderne,
Università degli Studi di Messina, Messina, Italy

Abstract

Giraldi's education was based, as was often the case in the humanist age, on an integral concept of knowledge, a complementarity of philosophical-scientific and rhetorical-literary disciplines, promoted mainly by Guarino Veronese (fifteenth century) in Ferrara. The entire

Giraldian literary production (from tragedy to epic, from tales to treatises) reflects this approach and aims at reconciling classical philosophy (mainly Plato, Aristotle, and Seneca) with Christian and Counter-Reformation thinking. Giraldian cultural activity developed from the 1520s to the year of his death, 1573. This was a period of crucial historical and political events (the Sack of Rome of 1527, the European wars for the conquest of the Italian peninsula, the Lutheran Reformation, and the Counter-Reformation) and of significant literary and linguistic debates, in which Giraldi took an active part, with speeches, epistles, treatises, destined to leave their mark on European literature.

Alternate Names

Biography

Son of the Ferrarese Cristoforo Giraldi and the Piedmontese Lucia Mombelli, Giraldi graduated on June 20, 1531, from the Faculty of Arts and Medicine of the University of Ferrara. His teachers were Celio Calcagnini (for rhetoric), Soccino Benzi (for dialectics and physics), Niccolò Leonicensi (for moral philosophy) and Giovanni Manardi (for medicine). After his graduation, Giraldi practiced medicine for a while, alongside his teachers, also assisting Ludovico Ariosto during his illness until his death in 1533. In the meantime, he taught philosophy at the Ferrarese university until at least 1541, when he began teaching Rhetoric, replacing Celio Calcagnini, who died that year. Several introductory lectures to his academic courses testify to Giraldi's didactic commitment: the *praelectiones* on Aristotle's *De anima*, on Cicero's *De natura deorum* and on *De oratore* (all preserved in Ferrara, at the Biblioteca Comunale Ariostea, ms. Cl. I 377). In Ferrara, Giraldi also became a member of the "Accademia degli Elevati" ("Academy of the Elevated") that was founded in Alberto

Lollio's house on May 1, 1540, and dissolved a few years after the death of its main supporter, Celio Calcagnini (Gallo 2013: 312, no. 17). The "Elevati" promoted a fusion of poetry-oratory-philosophy (Gallo 2013: 324–326) that also characterized the project of the "Accademia dei Filareti" ("Academy of the Filareti"), founded by Vincenzo Maggi in 1554 of which Giraldi was also a member (Gallo 2013: 313–314, no. 18). In 1541 Giraldi started his dramatic work in Ferrara, where a vivacious theatrical tradition was well established. His first tragedy (*Orbecche*) was staged in his own home, in 1541, with a sumptuous set (Doglio 2013) and was published later, in 1543 (Giraldi 1543b, 1988) with many successive reprintings during his lifetime. The other eight tragedies (*Altile*, *Antivalomeni*, *Arrenopia*, *Cleopatra*, *Didone*, *Epizia*, *Eufimia*, *Selene*) were published only after Giraldi's death and edited by his son Celso (see Giraldi 1583; modern edition: Giraldi 1985a, 1992, 1996a, 1999a, 2003, 2004, 2007, 2008).

On January 20, 1547, Giraldi became ducal secretary of Ercole II of Este. The diplomatic missions carried out by this honorary appointment are testified by speeches in favor of the doges Lorenzo and Girolamo Priuli (unpublished, but to be found in Ferrara, Biblioteca Comunale Ariostea, ms. Cl. I 377, 4 and 5), of Marco Antonio Trevisano and Francesco Venier and on the occasion of the death of Francis I king of France (see Giraldi 1553, 1554a). His prestigious role in the Estense court did not stop Giraldi from dedicating himself intensely to literature, elaborating and publishing *Discorsi intorno al comporre de i romanzi, delle comedie e delle tragedie* (Giraldi 1554b; see Giraldi 1999c, 2002). This work presents a remarkable reflection on literary genres, arising from his own experimentation and coeval production. Giraldi's works include almost all genres: tragedy (Giraldi 1583); comedy (*Eudemoni*, unpublished in his lifetime; the autograph copy is in Ferrara, Biblioteca Comunale Ariostea, Cl. I 407; see Giraldi 1999b); lyric poetry (composition in Latin – *silvae*, elegies, eclogues, epigrams, etc. – collected in Giraldi 1537, 1540, and vernacular poems collected in *Le fiamme*: Giraldi 1547); epic (the unfinished heroic poem *Ercole*; see

Giraldi 1557); satyr-play (*Egle*: Giraldi (1545); see Giraldi 1985b; Cremante 1988); tales (*Gli Ecatommiti*: Giraldi 1565; see Giraldi 2012); treatises (as well as *Discorsi* mentioned above, *Dialoghi della vita civile* included in *Ecatommiti* – see below – and *Discorso intorno a quello che si conviene a giovane nobile per servire un gran principe*: see Giraldi 1569, 1989); historiography (*Commentariolum* – see Giraldi 1556 – and *Historiae suorum temporum*, unpublished, whose autograph copy is kept in Ferrara, Biblioteca Comunale Ariostea, ms. Cl. I. 377); epistolary (private letters, and also many meant for literary circulation; for their contents and forms: see Giraldi 1996b), among which the elegant consolatory letter to Gabriele Ariosto for the death of his son Flaminio, who should have acted in the Giraldian tragedy *Altile*, but was murdered shortly before the play was staged (see Giraldi 1543a, 1996b: 186–196).

After the death of Ercole II Este in 1559, Giraldi's prestigious position at court began to change because the new duke, Alfonso II Este, favored intellectuals of the new generation and in particular Giovan Battista Pigna (1530–1575). In a short time Pigna, who had been Giraldi's pupil, became the ducal secretary, while Giraldi was slowly marginalized, to the point of being forced to move and devote himself to his literary profession elsewhere. After Pigna accused his teacher of plagiarism (Pigna's *I Romanzi* was published at the same time as Giraldi's *Discorso intorno al comporre de i romanzi*: see Pigna 1554, 1997), a controversy was ignited which is still the subject of study among the literary critics (Benedetti 1998; Ferroni 2013; Jossa 2013). In March 1563 Giraldi moved to Mondovì, in Piedmont, where he was invited by Duke Emanuele Filiberto of Savoy to teach rhetoric at the newly established university there. But after a few years in Mondovì, Giraldi was disappointed by the cultural policy of the Duke of Savoy, who favored the teaching of the Jesuits. For this reason and for the severe climate of the region that affected his health, Giraldi moved to Pavia in 1569, where he taught rhetoric at its university and became a member of the town's "Accademia degli Affidati" ("Academy of the Entrusted"). In 1573 he returned to

Ferrara, where he died in December of the same year.

Innovative and Original Aspects

Giraldi's literary work shows a strong theoretical orientation and an experimental tendency linked to a pedagogical concept of literature. Giraldi operated on solid ideological premises and elaborated the theory that literary genres must evolve and change according to the requirements of the historical moment of their authors. The aim was to have an impact on ethical, political and social progress. This concept is the opposite of an idea of literature inspired by rhetorical principles, fixed and universal, as among the neo-Aristotelians. These intellectuals thought that from Aristotle's *Poetics* they could extract immovable norms of poetry, in particular where epic and tragedy are concerned. For this reason, Giraldi's plays were criticized and judged as not conforming to Aristotelian rules; he received harsh criticism for his tragedy *Didone*, written and publicly read in 1541 (see Giraldi 1583, *Didone*: 129–137, 1996b: 153–171). He himself argued with his contemporaries in defense of a literary production relating more to their own time than pedantically loyal to tradition.

Giraldi's theory of tragedy is elaborated in his *Discorso intorno al comporre delle comedie e delle tragedie* (Giraldi 1554b, 2002), entirely built on the idea that a play, whether comic or tragic, has to inculcate moral values through a process of identification of the spectator with the protagonists of the action. Therefore, applying the Aristotelian theory of catharsis implies that the events staged have a high degree of consistency and likelihood and that the themes (be they historical or mythical) have a degree of compatibility with the ethical-political issues of the era of a given author. Thanks to the relativity of poetic norms, and with Aristotle's permission, authors can distance themselves from the literary tradition to guarantee the decorum of the matter in question and the pursuit of pedagogical

objectives. This conception does not concern only tragedy, but all literary genres. An example is the Giraldian defense of Ludovico Ariosto's *Orlando Furioso* against the harsh criticism of the neo-Aristotelians, who identified in this poem a lack of adherence to the canons of classical poetry. Regarding this matter, Giraldi wrote a letter to Giovan Battista Pigna (Giraldi 1996b: 226–233) in which he refuted all of the criticism leveled against Ariosto. In particular, Giraldi showed how *Orlando Furioso* belongs to a tradition (French and Spanish chivalric epic) different from classical epic, and he recalled all the innovations introduced by Virgil in his *Aeneid* in comparison with the Homeric poems, thus supporting a theory of the evolution of literary forms. Soon after Giraldi wrote a wider treatise on the issue of epic poetry in all its aspects (the *Discorso intorno al comporre dei romanzi*; see Giraldi 1554b, 2002), broadening the reflections expressed in his letter to Pigna. In this treatise he elaborated a theoretical proposal to reconcile narrative unity and variety, better resolved in a poem with a single hero as protagonist with a great variety of actions, all consistently and strongly connected to the main action. This idea was developed later by Torquato Tasso in *Discorsi dell'arte poetica* (1594; see Tasso 1959, book III: 586–92). Giraldi put his theory into practice in *Ercole*, a poem published in 1557 with 26 *canti* instead of the planned 48 (some of these remaining *canti* are preserved in an unpublished manuscript in Ferrara: Biblioteca Comunale Ariostea, Cl. I 406; see Giraldi 2016). The subject here is mythological, with encomiastic and celebratory references to Ercole II d'Este, but this poem is also full of pedagogical elements with respect to the moral implications of the "trials" of Hercules, who, having a choice between the flattery of a vicious life and the rigor of a virtuous life, chooses the latter (see Bruscaagli 1991; Jossa 2008; Villari 2015).

Giraldi's pedagogical project found its greatest expression in the *Ecatommiti*, the collection of tales and various themes that was published in 1565 in Mondovi (by the

Compagnia di Stampa, directed by Leonardo Torrentino), after a long period of elaboration (see Giraldi 2012: Villari, introduction, X–XVI). In this work Giraldi fully explains his idea of literature: the narration of 100 (and more) tales develops within a frame modeled on Boccaccio's *Decameron* and is held together by a very articulate and complex structure also containing a philosophical treatise on civil life (the three *Dialoghi della vita civile* are at the center of the collection, between the fifth and the sixth “decade” of tales). The *Ecatommiti* realizes most of all a fruitful mixture of the novelistic genre and the dialogic treatise, so that the theoretical discussion can rely on the *exempla* offered in the tales. These give the author the opportunity to reflect on the motivations of human behavior, to identify the roots of the societal evils, and to propose apt solutions to guide ordinary men toward proper civic conduct and rulers to the right use of judicial and political power. At the base of this elaboration are the fundamental achievements of ancient wisdom, reworked through the filter of Christian morality. The analysis of human vices and virtues based on Aristotle's *Nicomachean Ethics*, which gives concrete examples of how virtue can be located between two extremes of vice (e.g., liberality is situated in the middle between avarice and prodigality; courage between fear and audacity). The definition of the authentic aims of human life is elaborated by reconciling Platonic and Aristotelian thinking, with the contribution of Seneca's philosophy and Patristic literature: the metaphysical perspective of divine good combines with the secular in the pursuit of “felicità civile” (“civil happiness”), that is the practice of virtue in a social context. Independently from possession of material and ephemeral goods, individuals can realize themselves in civic society only by behaving in a virtuous, godly way. This Good is the specific object in the *Dialoghi* of the civil life: the rational soul aspires to leave the bodily “prison” and his ultimate aim is divine contemplation, but in the meantime he has the opportunity to test his virtues and potentialities on earth, in civil life.

This philosophical concept influences the whole project of educating men and founding a new society, through the research of a perfect equilibrium in the relationships between parents and children, masters and servants, rulers and subjects, and a reconciliation between ethics and the “reason of state” (in contrast to the difference between the political and moral spheres, as in Machiavelli). This learning process implies self-knowledge and knowledge of one's “divine” potential. With regard to this, the elaborations of Renaissance and humanist neo-Platonism (see, particularly, Marsilio Ficino, *Theologia platonica*) join the theories formulated in Aristotle's *De Anima*, revisited through the interpretation by S. Thomas Aquinas. Giraldi supported the thesis of the immortality of the rational soul in a university course dedicated to *De Anima*, whose unpublished inaugural lecture is preserved in the Biblioteca Comunale Ariostea di Ferrara (ms. Cl. I 377). This thesis, based on Thomistic thought, was the only one accepted by the Church. Such *quaestio* is discussed with renewed vigor in the *Ecatommiti*, in the second dialogue of civil life. This theme, in fact, opened the way to the definition of the role of man and of the relationship between virtue, fortune and providence: endowed with the divine gift of free will, man can follow the instincts dictated by the vegetative and sensorial soul, thus becoming similar to plants and beasts, or allow the guidance of the rational soul to become similar to God. Since Giraldi believed that Evil comes from ignorance, he meant to divulge these philosophical concepts and illustrate them with citations and examples in order to create the premises for the knowledge and the awareness of the authentic aims of human life. Moreover, the structure and narration of Giraldi's tales and tragic *fabulae* highlight human responsibility in the outcome of events: in spite of being attacked by Fortune, individuals can in fact demonstrate their virtue in facing adversities with constancy and courage through remaining faithful to ethical and religious values. According to Giraldi, divine providence's design has no impact on human freedom, but constantly stimulates

mankind to always recognize its own divine potential and the possibility to choose between good and evil.

Giraldi dealt with a number of important issues that became the object of discussion at the Council of Trent, earlier reaching conclusions similar to those of the Council. Among these issues it is worth citing the problem of clandestine marriages and the tradition of dueling, both analyzed in the *Ecatommiti*. But one would be mistaken in thinking of Giraldi as submissive to the Counter-Reformation. On the contrary, he always demonstrated openness to dialogue, often frequenting those of dubious Catholic orthodoxy and dissenting openly about the violent and persecutory methods of the Inquisition (see his letter to Egidio Foscherari, bishop of Modena, in Giraldi 1996b, lett. 101: 370–373; see also Horne 1958; Rozzo 2005: 215–240).

Legacy and Impact

Giraldi's literary output is characterized by consistency and ideological depth, and it deserves further study and research in the service of rectifying the widespread critical misunderstandings and devaluations made about his work in the past. The aim of current criticism is to give back to Giraldi Cinzio the credit of having been, in his own time, among the most authoritative protagonists of the Renaissance cultural scene, and for having significantly influenced subsequent European literature.

There is a vast bibliography on Giraldi, his cultural context, his works, and their influence on Italian and European literature. We only indicate (besides the works cited above) the following contribution for the overall bibliography: *Bibliografia giraldiana "vingt ans après,"* ed. by I. Romera Pintor, Madrid, Fundacion Updea, 2018; for bibliographic updates see the online bibliography at the website of *Studi giraldiani. Letteratura e teatro*: see below. Góis, Damião de

Born: Alenquer, Portugal, 1502

Died: Alcobaça, Portugal, 1574

Thomas Earle

University of Oxford, Oxford, UK

Abstract

Góis's unusual life brought him into contact with remote places as a boy, when he met the Ethiopian ambassador to Portugal. As a young man he worked in the service of the Portuguese king in Antwerp and travelled widely in northern Europe, where he met some of the reformers. For five months in 1534, he lived with Erasmus. After study in Flanders and in Italy, where he published his translation of the book of Ecclesiastes into Portuguese, he returned to Portugal where he spent the rest of his life. His last years were troubled by a trial before the Inquisition.

Góis's best-known work, an account of Ethiopia, written in Latin, was published in 1540. In it the principal speaker is an African. The book expresses Góis's interest in distant lands and his religious tolerance, for many of the practices of Ethiopian Christians were regarded as heretical by orthodox Catholics. The book also calls for the unity of all Christians, Protestant and Catholic as well as those living in Ethiopia and in Lapland, an area of northern Scandinavia which is treated in an

appendix. Góis's translation of the Old Testament book of Ecclesiastes, which survives only in a single copy, is remarkable for its use of Jewish scholarship. In this Góis goes much further than Erasmus, and he may have been the most tolerant man of his age.

Biography

Góis had an extremely unusual and cosmopolitan life by the standards of sixteenth-century Portugal. He became a page at the royal court of King Manuel at the age of 9, and a few years later, in 1514–1515, he met there the Ethiopian ambassador, Matthew, an event which was to influence his subsequent literary career. In 1523 the new king, João III, appointed him as secretary of the Portuguese factory (trading centre) in Antwerp. He continued to live abroad until 1545. Very few other Portuguese had Góis's experience of life in northern Europe during the Reformation. During this time he met Luther and Melancthon and also studied in the universities of Louvain and Padua. In 1534, he spent five months in Freiburg as a guest of Erasmus, and in 1537, assisted the Italian cardinal Sadoletto in his attempts to reconcile moderate reformers with the Catholic Church. In 1545, he returned to Portugal where he subsequently became royal chronicler. However, the political climate had changed and his contacts with Protestants made him an object of suspicion. In 1571–1572, he was tried by the Inquisition and, although subsequently released, the circumstances of his death have never been entirely explained.

Works

During his years outside Portugal Góis wrote and published a number of historical, geographical, and ethnographical works in Latin. One of these, *Fides, religio, moresque Aethiopum* (The Faith, Religion and Customs of the Ethiopians, 1540) was an international best-seller. He also translated Cicero's *De Senectute* (On Old Age) and the Old Testament book of Ecclesiastes into Portuguese

(Venice, 1538). Later, as royal chronicler, he published, in Portuguese, two long historical works, the chronicles of Prince João, subsequently King João II (1567) and of King Manuel (1566–1567).

Heritage and Rupture with the Tradition

Góis was not a philosopher. However, his work is of interest to the history of thought because of the remarkable religious and racial tolerance which he expresses, very possibly uniquely in the Europe of his day.

The Portuguese had been in contact with sub-Saharan Africa since the early fifteenth century, and black Africans appear frequently in the poetry and drama of the early modern period, as figures of fun. Góis, however, makes the Ethiopian bishop who succeeded Matthew as ambassador to Portugal the main speaker in his *Fides*. In his account of Ethiopian religious life, expressed in correct humanistic Latin, the bishop describes many practices different from those of orthodox Roman Catholicism, but Góis, always tolerant, makes no comment. The bishop also calls for the unity of all Christians. Although in this he was pursuing a specifically Ethiopian agenda (Aubin 1996), his words undoubtedly struck a chord with Góis, who was deeply committed to the inclusion in the Christian family of people of different races, including the Lapps of Scandinavia (Góis 2006a, b).

Innovation and Original Aspects

His two translations, which were published together, imply equivalence between the wisdom of the Bible and of that of classical antiquity. In that the evidence of Erasmus is evident. However, in the translation of the book of Ecclesiastes, which survives in a single copy, Góis goes much further than Erasmus in his attitude to Jewish Biblical scholarship. Erasmus criticized what he calls "the letter that kills," by which he meant the Jewish failure to understand the deeper meaning of the Old Testament. Góis, on the other hand,

praised unreservedly the Hebrew commentary of Ibn Ezra (1089–c.1165), which he knew probably through personal contact with Italian rabbis (Góis 2014).

Impact and Legacy

Góis's *Fides* was banned in Portugal, partly at least because of the perceived similarity between some aspects of Ethiopian religious life and Jewish practice. However, abroad it achieved enormous success (more than 40 copies, in many different editions, in Oxford and Cambridge alone, Earle 2009). The translation of Ecclesiastes, printed secretly in Italy, disappeared from view entirely until its recent rediscovery. On the other hand, the chronicle of the reign of King Manuel, in which Góis also criticizes royal policy towards the Jews, became the standard history of the Portuguese overseas expansion, in the Latin version prepared by Jerónimo Osório (Lisbon 1571) which was widely read internationally.

Government, Renaissance Forms of

Marco Toste

Institut für Philosophie, Goethe-Universität
Frankfurt am Main, Frankfurt am Main, Germany

Abstract

The Aristotelian sixfold classification of forms of government became the mainstream classification right after the translation of the *Politics* and the *Nicomachean Ethics* into Latin in the thirteenth century, and it largely remained so until the end of the sixteenth century. It was used in a variety of contexts (even with regard to the government of the Church) as well as for propagandistic and descriptive purposes alike. However, upon the Latin translation of both Plato's *Laws* and Book VI of Polybius' *Histories*, and

importantly Machiavelli's use of the latter, authors dealt almost exclusively with the topics of monarchy and republican regime. For the most part, authors conceived these two regimes as a mixture of different forms (monarchy, aristocracy, and democracy) in which one prevails over the others, and hence probed deeply into what came to be known as the "mixed regime." In the sixteenth century, the Aristotelian distinction between good and corrupt forms of government started to fade away, and – after Bodin – what classifies a regime as either good or corrupt is the way in which power is exercised. Irrespective of what form they considered the best, all authors conceded that the establishment of a given form is dependent on the prevailing circumstances and therefore every form, other than tyranny, might be legitimate.

Heritage and Rupture with the Tradition

In very broad terms, Renaissance authors still hold to the sixfold classification of forms of government set forth in Aristotle's *Politics* (III.7 and IV.2) and *Nicomachean Ethics* (VIII.10–11). This classification, together with the changes it underwent due to its interpretation by medieval Aristotelians, was not challenged until the sixteenth century. It stipulates three basic good forms of government (monarchy, aristocracy, polity) along with their respective corrupt or degenerated forms (tyranny, oligarchy, democracy). This distinction of regimes is based on objective quantitative and qualitative criteria: the number of rulers (one, a few, or many), the aim of the regime (the common good or only the good of the ones that hold power, e.g., the poor or the wealthy), and the requirement of access to public offices (virtue, property qualification, or freedom). The theoretical underpinning of this typology of forms of government is a hierarchy of (not mutually exclusive) goods: moral virtue over external goods, common over partial goods, as well as stability and the preservation of the social order over dissent and social change. As with any

classification of regimes, it is concurrently normative and descriptive. This means, therefore, that it served both as an axiological structure and support for an author's political agenda. Because this framework was employed in a new historical context, one quite foreign to that of Aristotle, and because it also served to legitimize the contemporary political context and social stratification, medieval and Renaissance authors transformed some of Aristotle's ideas regarding each of the forms of government. Perhaps the most striking instance of a distinct use of this typology is the case of the fifteenth-century ecclesiological debates: whereas conciliarist authors such as John of Segovia extensively employed the notion of aristocracy as well as the Aristotelian arguments in favor of the rule of the many over the rule of the one to defend the supremacy of the council over the pope, the opposing side drew on the arguments used in the Aristotelian tradition in favor of monarchy as the best regime (Black 1970). Moreover, Pierre d'Ailly and Jean Gerson applied the notion of "mixed regime" to the Church, which they considered a monarchical rule with aristocratic and democratic elements.

The notion that medieval and Renaissance authors had of each of the forms of government, and why one of them ranks above the others, did not exactly match that of Aristotle. This can be briefly illustrated by taking into account each of the six forms.

Monarchy was conceived as the rule of one virtuous man and as the best regime in absolute terms, though not under every condition (thus it might not be suited for all peoples). This belief was even shared by authors who were not monarchists, such as Savonarola, Gasparo Contarini, Francesco Guicciardini and Donato Giannotti, all of whom stated that other regimes such as aristocracy and polity were better suited to the specific situation they were writing about (Florence and Venice). However, the idea that monarchy was the best regime and implied the highest standard of virtue for both the ruler and the citizens was used against itself: either because it is hard to find a truly outstanding virtuous man or because the

greater part of the citizens fall short of virtue and cannot abide by the best regime. As a result, a republican regime could, under certain circumstances, be much more expedient. Many of the arguments in favor of monarchy originated in medieval political thought prior to Dante and were still widely used by Renaissance authors, sometimes drawing upon arguments from Dante's *Monarchy* (these arguments are discussed in Lambertini 2001). Such arguments include that monarchy is "the most natural" form of rule because it resembles the arrangement of the universe ruled by one God; the organic analogy (the heart governs all other organs and limbs); the analogy to bees and insects that possess only one ruler; or the argument that monarchy is better at keeping the peace, for individual rule permits less dissension and is less susceptible to corruption than rule by several or many men. These kinds of arguments are found in authors as diverse as Coluccio Salutati, Lippo Brandolini, Giovanni Pontano (in his *De obedientia*), Filippo Beroaldo the Elder (in his *De optimo statu*), Erasmus, Claude de Seyssel, Giannotti, and Georges Buchanan. The concept of monarchy englobed the power of the emperor as well as the pope, and the sacrality of kingship and the idea that the king is a *lex animata* remained all throughout the Renaissance. It comes thus as no surprise that humanists might associate the empire with peace and liberty (Lee 2018). The fifteenth century saw a revival of (Roman) imperial ideology in authors such as Antonio Roselli, Aeneas Sylvius Piccolomini, and Peter von Andlau (Burns 1992), but over time the idea of universal monarchy, which owed much to medieval thought, came to be seen negatively, being employed chiefly in polemical and propagandistic contexts, such as the dispute between France and the House of Habsburg (Bosbach 1988).

Aristocracy, the second-best regime, came to be conceived not simply as the rule of a few virtuous men, as Aristotle understood it, but also as the rule of nobility by birth (nobility was understood as an inherited natural inclination toward moral virtue and thus noblemen were for the most part virtuous) and as the rule of the wealthy (this was grounded on the Aristotelian hint that wealth

is a necessary condition for virtuous action). In this way, aristocracy became a regime associated with specific social groups (aristocracy or an urban patriciate), being commonly identified with Venice and referred to within the context of the so-called "myth of Venice." This form of government was mainly discussed in the context of the "mixed regime" – that is, as a constituent of another form resulting from the blending of two or three different forms (see below). Apart from Venetian authors, very few authors preferred this regime. Perhaps the most notable case is John Calvin, who considered an aristocracy tempered with democracy the best form of rule.

The third-best regime, polity, is for Aristotle a mixture of oligarchy and democracy. It is the regime in which neither the wealthy nor the poor have the upper hand and in which the class formed by the middling citizens (i.e., between the wealthy and the poor) is able to rule. In this regime, owning property is a requirement for holding office. This regime is also defined in the *Politics* (III.7, 1279b2–4) as the regime in which the citizens possess arms. It was referred to under different names: polity (*politia*), as in the medieval translation of the *Politics*; timocracy, as in the *Nicomachean Ethics*; mixed regime (*politia mixta*), given its blended character; and republic (*respublica*), following Leonardo Bruni's translation of the *Politics* according to Ciceronian literary standards. As early as the beginning of the fourteenth century, in authors such as Ptolemy of Lucca and Bartolus of Sassoferrato, this regime was associated with the Italian free city-states, and, more importantly, it was regarded as the most suitable form for small political communities, while monarchy was more appropriate for larger populations and tracts of land. This regime was first identified with the Venetian state (which was regarded either as an aristocracy or as an aristocratic republic), later with Florence, and – after the translation of Polybius' *Histories* – with the ancient Roman Republic. Note, however, that the greater part of the Renaissance authors envisaged this form of government not as the mixture of oligarchy and democracy, as Aristotle did, but as a mixture of democracy, aristocracy, and even of monarchy (see below). In the Italian cultural

context, it was also identified with the regime that by definition fostered the most moral and political virtues.

Among the corrupt forms of government, the least bad is democracy: the only requirement to hold public offices is to be a free person (or to possess a very small amount of property). Democracy is a corrupt regime because the equality supposed in the distribution of offices does not take account of the merits and virtue of the recipients. Moreover, the poor rule for their own advantage, and the kind of liberty sought is to do whatever one wants. Sometimes democracy retained an ambivalent character for medieval and Renaissance authors, because in Aristotle's *Rhetoric* (I.8) it is listed not as a corrupt regime, but merely as one of the four basic forms (monarchy, aristocracy, democracy and oligarchy). In this way, authors such as Engelbert of Admont and, even more so, the fifteenth-century scholastic Alfonso Madrigal (El Tostado), who nevertheless draws on the *Politics*, regarded democracy in positive terms. He reasoned that it was less dangerous than the other regimes because in this case the majority of the citizens are not excluded from power (Toste 2018). Moreover, after the translation of Book VI of Polybius' *Histories*, democracy began slowly to be seen as a good form of government. This has to do with the fact that Polybius viewed democracy as a good form of rule, whose degeneration is ochlocracy, that is, mob rule. By the end of the sixteenth century, some authors had already used the term democracy to refer to the Aristotelian polity or republican regime (Fabio Albergati and John Case).

A more corrupted form than democracy is oligarchy, where a few wealthy individuals govern for their own sake. This was perhaps the regime to which authors paid the least attention; it was sometimes simply interchanged with aristocracy – the idea being that the virtuous noblemen were also wealthy – and oligarchy was principally mentioned within the discussion of the mixed regime.

Finally, the worst regime is tyranny, in which a single ruler governs for his own private good and against the will of the citizens. That the consensus (or lack thereof) and compliance with law are what distinguish a king from a tyrant are repeated

with increasing frequency in the Renaissance. Given their own political reality, medieval authors paid considerable attention to this regime, and Renaissance authors still drew on Bartolus of Sassoferrato's juridical distinctions regarding the tyrant: the tyrant can be either *ex parte exercitii* (he exercises his power tyrannically) or *ex defectu tituli* (having acquired his power unlawfully, by usurpation). In addition, Bartolus speaks of hidden or disguised ways in which tyranny can occur, but this point proved less influential. Renaissance authors might on occasion still frame tyranny in theological terms, that is, as a divine punishment for the sins of the citizens or the king, but such an idea tended to give way to the notion that tyranny was simply one form of government that might result from the degeneration of political life. The numerous humanist mirrors for princes did not engage in discussions about the definition of tyranny; they mostly concentrated on the qualities (virtues and vices) required of the office and on a normative discourse about kingly power.

Apart from the commentators on the *Politics*, authors did not typically elaborate on what defines a form of government or discuss (causes of) the changes of regimes – at least until the early sixteenth century. The definition of a political regime hinged on two elements: *who* holds the power – and thus has the capacity to distribute offices – and the *end* aimed at by the regime. For medieval authors, these two elements confer unity to the regime; if citizens pursue different ends, then sedition arises. Political unity is thus achieved through concord (concerning the *end*) and “political friendship,” which implies the sharing of the same civic values – this is one of the motifs behind the emphasis on friendship found in many humanist mirrors for princes (Ceron 2011). These ideas went unchallenged until Machiavelli. As to the causes of why a form of government is replaced by another – that is, why revolutions occur – some authors drew on Aristotle and maintained that political change arises from disputes about the conception of justice and from how equality is to be understood (numerical or proportional). But irrespective of how Aristotle's understanding was applied, it was generally accepted that political change originated from disputes between the

two main social groups: when one group felt underrepresented and possessed the means to introduce new procedures or limit/expand access to offices, then a change of the rule could occur, for instance, from *signoria* to *comune* (on this, see Meier 1994).

The classification of forms of government is not limited to the mere assumption that there are six forms. Because not everyone is able to attain the highest standards of virtue, more than one form of rule exists. The institution of a given regime also depends on the social composition of each community (whether there are too many poor or wealthy individuals) and on which faction prevails (the plebs, the wealthy, the virtuous); and it cannot be dissociated from anthropology if we assume that different climates, geographical locations, and the motion of the stars can influence the bodily constitution of men, and in this way affect their mores (this assumption runs all through medieval, Renaissance and early modern political thought, including Bodin and Montesquieu). For these reasons, the institution of a given form depends on the circumstances under which it is established. Medieval authors used Aristotelian hylomorphism to argue that not just any form (of government) could be applied to any matter (the people), but rather that matter and form must be reciprocally appropriate. In his *Della repubblica fiorentina*, Giannotti still uses this idea to state that, given its conditions, Florence can only adopt the republican form of rule (Gaille-Nikodimov 2005, 53). It is within this line of thought that in the *Discourses on Livy* (I.55) Machiavelli states that a kingdom cannot be established if there is too much equality and, likewise, a republic cannot arise if too much inequality prevails. Here, it must be stressed that if the form depends on the conditions to which it is applied, then any form can be legitimate and preserved if certain conditions are met and if the citizens wish it so (the exception to this rule is tyranny, which by definition is against the consent of the citizens). Of course, each form has its own way of being preserved as well as its own specific justice and system of laws, and this is understandable given that democratic justice is different from the kind of justice in an aristocracy. Even a

tyranny can, under certain circumstances, be preserved or at least tempered (given that tyranny is always preferable to the state of anarchy).

Forms of government are also assessed according to their ability to maintain political stability: in this sense, monarchy is usually seen as the most stable regime, since one individual cannot disagree with himself. In contrast, democracy is more stable than oligarchy, because whereas in the former there is dissension between the poor and the wealthy, in the latter there is dissension between the poor and the wealthy as well as amongst the ranks of the wealthy (while this was Aristotle's view, not all Aristotelian authors subscribed to it; see Toste 2018, 296–298). However, because democracy was conceived as the rule of the poor, and thus implied the exclusion of patricians from power, it was often more closely associated with tyranny. Even republican authors, both before and after Machiavelli (Paolo Paruta and Guicciardini, for instance), regarded the plebs as an instable class; this was the reason why many authors preferred a form of rule such as the Venetian regime (or, more generally, the *governo stretto* in which the plebs did not take part in power). It became commonplace to think that the participation of the plebs in power increases the danger of tyranny, or something approaching tyranny (a tyranny of discord) (see Villard 2008, 597–605).

Generally speaking, authors tended to state that the rule of the many guaranteed liberty and participation in civic life, while the rule of the one procured social peace and stability. Things in reality were far more complex: many of the dangers and negative implications typically associated with each of the forms of rule were actually present in the others as well. By the late sixteenth century, the question of the best regime dwindled and regimes were praised insofar as they could foster peace. There was also a sense of ideological or partisan appropriation of Aristotle's classification: it also served as a tool to be used in the most varied contexts and for propagandist or polemical intents. This is clear in the Italian context: the *comuni* were often controlled by an oligarchy, but authors never referred to them using such a term (Ricciardelli 2015). Such an ideological use

also explains why the models taken from classical history were so important in the context of “republicanism”: Venice was often associated with Sparta, while Florence was associated with Athens and later with Rome (Cambiano 2007). Authors used Aristotle’s typology of forms of government very freely, and therefore the use of the typology did not involve any strict adherence to Aristotle’s thought. This can be illustrated by means of three examples: Leonardo Bruni identified the Florentine regime with the mixture of aristocracy and democracy (Dees 1987) and in the *Funeral Oration on Nanni Strozzi* equated monarchy with illegitimate rule; Uberto Decembrio described Florence as an oligarchy and, in contrast, Milan – which was a duchy and often associated with tyranny – as a timocracy, reasoning that there the citizens possess military honor (Komorowski 2012, 54–55); Alfonso de Cartagena viewed the city of Toledo as an aristocracy only capable of turning into its opposite, an oligarchy, and thus incapable of transforming into a democracy, which he associated with mob rule and riots like those that took place in Toledo in 1449 – note that for Aristotle any form may change into any other form and not, as Cartagena maintains, only into its opposite (Toste 2018, 333–337). Likewise, the terms “tyranny” and “tyrannical” were often applied as qualifiers to every unjust government and sometimes even employed for polemical purposes (for instance, in his attack on Coluccio Salutati, Antonio Loschi characterized Florence as a tyranny).

The use of the Aristotelian sixfold classification by an author did not mean that he was necessarily an Aristotelian. Authors could draw on Cicero, Sallust, and Roman law to argue for the republican regime, or draw on metaphysical and theological arguments to claim the supremacy of monarchy over the other regimes or even to justify the occurrence of tyranny. Within the discussion of kingly power and virtues, as well as its negative representation, tyranny, authors made significant use of Xenophon, Seneca, and Plutarch. Moreover, even Aristotle was heavily appropriated by authors defending monarchy (Lippo Brandolini, Giovanni Pontano, Guillaume La Perrière) and the republican regime alike (Lauro Quirini, Contarini,

Giannotti, and Bartolomeo Cavalcanti). And the same appropriation of Aristotle to defend the supremacy of one of these two regimes is found within the Renaissance commentary tradition on the *Politics* (Toste 2011). Aristotle provided the general framework, and within this framework he could be used as a source like any other.

These two forms of government – monarchy and the republican regime – polarized the political discourse both in the Middle Ages and the Renaissance, and it arose almost as a natural consequence that Machiavelli focused exclusively on these two regimes. They were not seen as opposed and competing regimes, at least not until the second half of the fifteenth century (Hankins 2010; it should be noted, however, that there was a line of advocates of elective government who criticized hereditary succession: this line goes from Marsilius of Padua up to Quirini, Bartolomeo Platina, and Machiavelli, all of whom maintained that succession involves degeneration). There is no trace of what has recently been labeled “republican exclusivism” (cf. Hankins 2010), that is, an anti-monarchical stance maintaining that republics are the only legitimate regime. No author defending the republican regime would deny legitimacy to monarchy and vice-versa, and indeed one and the same author – whether Platina, Francesco Patrizi, or Pier Paolo Vergerio – could write two distinct works, one on the republic and the other on monarchy, outlining the benefits of each form of government. It has been argued that the term “republic” came to signify a regime opposed to monarchy after the reintroduction of Tacitus (Wootton 2006), but such a view has been dismissed (Hankins 2010, 470). Moreover, Renaissance writers would not necessarily have considered a monarchy more authoritarian than a republic; since monarchy was conceived as the most stable rule, it was seen as the regime least susceptible to tumults, securing in this way more freedom for its citizens than a republic (van Gelderen and Skinner 2002, I.3; Blom et al. 2007). In the Renaissance, monarchies and republics continued to be regarded as sharing a number of features: neither majority rule nor the elective principle were unique to a specific regime – the Holy Roman Empire was an elective monarchy –

and republican authors could even argue for the existence of a supreme ruler appointed for life, such as the Doge in Venice or Guicciardini's suggestion of a perpetual gonfalonier. Finally, the terms monarchy and republic were connected with many distinct and sometimes opposing conceptions. Republican authors might favor a more aristocratic regime, such as the one in Venice, or one with more popular leanings – what authors referred to respectively as *governo stretto* and *governo largo*. Likewise, the notion of limited monarchy was very different from that of absolutist monarchy (for an illustration of the manifold notions of monarchy, see Dreitzel 1991). It seems misleading, however, to draw a clear-cut opposition between “absolutists” and “constitutionalists” (the term used to label authors who defended that the government has to be law-abiding): authors on both sides upheld restraining the king's actions – one resting on the king's own will to act in accordance with natural and divine law rather than on institutionally defined limits – and, at the same time, his superiority over any majority (on this, see Jouanna 2013, 24–49, who provides the examples of Guillaume Budé and Seyssel, among other French authors, who have been seen as “absolutists” but also as “constitutionalists”).

Finally, two aspects closely associated with these two forms of government enable us to grasp the continuity as well as the rupture between the Middle Ages and the Renaissance. For Aristotle, each form of government can either be merged with another or brought closer to one of the other five forms. This is possible because each form has its own subtypes (for instance, monarchy has five and oligarchy four) and each form can integrate elements from others – it can thus be blended with others (for instance, in II.12 Aristotle presents the view according to which Solon's Athens was a combination of aristocratic, oligarchic, and democratic elements). Moreover, each form can lean toward another form: an oligarchy can tend toward democracy, for it might possess certain democratic features (offices may be more accessible in one subtype of oligarchy than in a simple oligarchy due to a lesser property qualification). It is against this background that we can

understand the crucial notion of “mixed regime,” a notion that was not the same for Aristotle and for his medieval interpreters. While for Aristotle this regime was primarily understood as a blend of democracy with oligarchy, for medieval and Renaissance authors it was rather a mixture of monarchy, aristocracy, and democracy. The main sources for this change were the *Politics* II.6, where the Spartan regime is portrayed as the combination of monarchy, aristocracy, and democracy, and principally Thomas Aquinas' *Summa theologiae* Ia–IIae, q. 105, art. 1, where the best regime is identified with a monarchy tempered with aristocracy and democracy. This mixture of three regimes, in which either monarchy or aristocracy could prevail, served to express both the idea that all of the main social classes could participate in power – whether more actively (nobility) or more passively (plebs) – and the idea that principally the conception of a limited or tempered monarchy could avoid the degeneration of monarchy into tyranny (authors tended to emphasize that this degeneration could easily come to pass in a non-tempered monarchy on account of too much power concentrated in one man's hands). In connection with this, another medieval innovation, originating in a misreading of the first chapter of the *Politics*, would prove influential in the following centuries. This is the distinction between *regimen politicum* and *regimen regale*: in opposition to kingly rule, “political rule” was conceived as any political government in which rulers govern in accordance with the law (and, for some authors, where offices are held in turn). This distinction became prominent in the work of Ptolemy of Lucca and can also be found in Coluccio Salutati, Peter von Andlau, and John Fortescue (who nevertheless conceded a rule that was at the same time political and regal).

The idea of a mixed regime as the blend of monarchy, aristocracy, and democracy became important in two different contexts. On the one hand, it was employed with regard to the French and English monarchies by authors who wished to stress the restraints upon kingly power and the role of assemblies (for instance, François Hotman in France and Thomas Starkey in England). In many cases, the notion of a mixed regime was

not discussed in depth. This holds true for Thomas Smith's *De republica Anglorum* (1565). However, this notion became so important in England that it was later used (and turned on its head) by King Charles I, in his 1642 *Answer to the Nineteen Propositions*, with the aim to prevent the prominence of parliament. On the other hand, it was used by republican authors as well. Instead of simply following Aristotle, for whom the republican regime resulted from a mixture of democracy with oligarchy, they replaced oligarchy with aristocracy – so that noblemen could be represented in a positive light in this rule – and introduced monarchy – so that it could be applied to Venice, where the Doge held the supreme power, and later to Florence. In fact, the republican mixed regime came to be associated primarily with Venice, at least since the early fourteenth century, thanks to Henry of Rimini and Pier Paolo Vergerio. It was also used outside of Italy, for instance, in the *Tractatus de civitate Ulmensi* by the fifteenth-century Swiss Dominican Felix Fabri. It received its most well-known formulation in the work of the Venetian Gasparo Contarini. He considers the Doge perpetual and thus to represent monarchy, whereas the Senate exemplifies the aristocracy and the Great Council stands for the people (on the mixed regime, see Nippel 1980; Blythe 1992; Gaille-Nikodimov 2005). The use of this model had a further consequence: the Aristotelian reference to a “middle class” was downplayed and is, in fact, absent from Machiavelli's work. However, Machiavelli's reduction of the factions within the state down to two groups (the great and the plebs) was not followed by subsequent authors, many of whom (including Guicciardini, Giannotti, Brucioli, and Bartolomeo Cavalcanti) still mention the “middle class” (*mediocres*). Moreover, although the “mixed regime” denoted the inclusion of democracy and aristocracy into this form of government, not every author drew an exact connection between these two regimes and the social classes typically associated with them – plebs and nobility, respectively. By way of example, and in a very medieval Aristotelian fashion, aristocracy means for Guicciardini the group of prudent and wise men capable of advising the community, and

George of Trebizond, in the introduction to his translation of Plato's *Laws*, suggests that the “people” representing democracy are part of the Venetian lower classes, but are not plebs.

Innovative and Original Aspects

The main changes to the medieval framework came from the Latin translations of both the sixth book of Polybius' *Histories* (not to mention Machiavelli's use thereof) and Plato's *Laws*. In contrast to Aristotle, for whom any form of government may change into any other form, Polybius maintained that there is a cyclical natural order in the forms of government, the so-called anacyclosis. According to this view, a good form of government is always replaced by its corrupt form – an endless alternation between good and bad forms (with the exception of the rule of the one). He established the following sequence: monarchy, kingship (an improved version of monarchy because it ensues from consent and is according to reason), tyranny, aristocracy, oligarchy, democracy, and finally ochlocracy. Having completed the cycle, the sequence starts over again and goes back to monarchy. The idea of a progressive degeneration from one best form to the worst is also present in Plato's *Laws* and *Republic*. Clearly, the anacyclosis underscores the instability inherent in all forms of rule, since none of them, whether good or corrupt, is apparently able to last very long. The anacyclosis thesis did not meet with great approval in the Renaissance: authors who made use of Polybius either adapted it (like Seyssel; cf. Sciacca 2005) or underlined that matters were more complicated. This holds true for Cavalcanti and Machiavelli. The latter contended that no reoccurrence of the best form takes place after the conclusion of the worst form (the mob rule); instead, the community is simply conquered by a better-ruled state. While the anacyclosis thesis was not particularly influential, what *did* resonate with Renaissance authors was the idea that no simple form is perpetual, not even the best form. The remedy that Polybius proposes against this is a mixed regime – one made up of the three good forms (monarchy,

aristocracy, and democracy), a form he related to the Roman Republic and, like Aristotle, to Lycurgus' Sparta. While Polybius maintained that the republic of Rome stemmed from the consensus of the different classes, he underlined that Lycurgus' purpose was to find a state of equilibrium between the principles of the three forms of governments and that such an equilibrium was based on the reciprocal fear between the commons, the elders, and the kings (*Histories* VI.10.6–10). Polybius is an important source for Machiavelli's *Discourses on Livy*, but his ideas are used in a creative way: unlike Polybius, Machiavelli argued that the greatness of Rome was caused not by concord of the body politic, but rather by the tension between the two main classes.

Machiavelli's conception of the forms of government is not constant throughout his works, though he tends to reduce the regimes to two main forms, the republics and the principalities. While Machiavelli does not explicitly distinguish between principality and kingdom, the latter seems to apply to larger territories (Sciaccia 2005, 31–32), and in *The Prince* he never uses the word tyrant – a notion he definitely downplays. Given its aim, *The Prince* focuses on principalities. Compared with previous authors, Machiavelli places more emphasis on the ways in which a prince can acquire his dominion. In this regard, he distinguishes between hereditary and new principalities (in the latter case, a prince gains his dominion through virtue, fortune, violence, or the citizens' consent; a principality can indeed take the place of a republic thanks to the consent by the plebs and the great, in which case it is called "civil principality"). But despite his attention to the ways of acquiring a dominion, Machiavelli pays greater heed to the means by which a regime can endure. For this reason, Machiavelli does not differentiate good from corrupt forms in *The Prince* (although he does so in the *Discourses*); the criterion for assessing the value of the regimes rests rather on the ability of a specific form of rule to endure. In Chapter 9 – where Machiavelli sets forth the principle that the people and the great are the two main political forces, and the tension between them results either in principality, in liberty, or in license (i.e., in anarchy) – he argues that

the prince can rule either with the favor of the people or with the favor of the great. This means that any principality can have popular or aristocratic leanings (something that Aristotle already maintained with respect to any kind of regime). In Machiavelli's view, neither the great nor the people should completely prevail in one regime, though he values far more the people's role and thus regimes, such as the French Kingdom, where the great or the nobility are swayed and the rule of law is real.

In the *Discourses*, Machiavelli emphasizes (more so than Polybius) that even a good regime cannot endure; such regimes are easily corrupted and, therefore, all the simple forms of government are unsafe. Like Polybius, however, Machiavelli praises the mixed regime, which he also identifies with the Roman Republic. This was a perfect regime because it integrated the people and lessened the power of the aristocrats (on Machiavelli and republicanism, see Bock et al. 1990).

Three main novelties emerge in the *Discourses*. First, in contrast with the previous tradition, Machiavelli favors the role of the plebs and a regime in which the plebs can share in power – that is, he prefers the *governo largo* over the *governo stretto*, where only the great hold offices. For Machiavelli, it is more often than not the nobility's ambition to command that leads to tyranny (Najemy 2007); in this regard, Venice and Sparta are negative models because in these two cases power is concentrated in the hands of the nobility. Machiavelli overturns the traditional arguments against the wisdom of the multitude, many of which derived from Book III of the *Politics*.

The second novelty is that the assumption that all regimes (other than tyranny) are installed and preserved through concord and equilibrium between factions (few vs. many, poor vs. wealthy, virtuous vs. wicked) is replaced with the idea that social tension between the great and the plebs is positive and guarantees liberty (the idea being, provided that such tension occurs in a law-abiding political regime, that neither can prevail). A mixed regime is expedient not because it enables a balance between its elements, as previous authors had argued, but insofar as it

originates in a conflict between the social groups (great vs. plebs), restraining the ambitions of both (Pedullà 2018).

The third novelty regards Machiavelli's conception of tyranny. Prior to Machiavelli, the distinction between kingship and tyranny was not totally sharp: Giles of Rome had stated that a king somewhat resembles a tyrant, and that a tyrant is nevertheless a ruler. Moreover, Poggio Bracciolini argued in the *De infelicitate principum* that the distinction between tyrants and kings rests exclusively on the way they exercise power. Nonetheless, authors strove to establish objective criteria in order to distinguish between a tyrant and a king – this explains the lists drawn by Giles of Rome (*De regimine principum* III/2.9) in which he enumerates the qualities of the king and of the tyrant (the list of the tyrant's hallmarks was later spread by Bartolus and reproduced by other authors). Such lists were so important that Althusius still drew on those made by Paride del Pozzo in the fifteenth century detailing the “excesses” of different rulers and magistrates, from the emperor to the lower-level officers. But, for Machiavelli, the definition of tyranny is related neither to the way in which power is acquired nor to the cruelty with which power may be used. The characterization of an act as tyrannical depends on the circumstances at hand; at any rate, this holds when it endangers the preservation of the state, when it involves self-interest against the common interest, or when there is an attempt to restrict the access of citizens to public offices (Giorgini 2008). In exceptional circumstances and times of emergency, the rule of the one may indeed be more expedient than a republic. Nevertheless, he distinguishes between tyranny and dictatorial authority: unlike a tyrant, a dictator remains in office for a limited time and cannot overturn the legal order (Geuna 2017).

Aristotelian authors also valued political regimes according to their ability to remain stable, to endure, and to eschew upheavals – this led Aquinas to argue in the *De regno* that tyranny was more tolerable than a degenerate rule of the many. Starting with Machiavelli, however, a much stronger emphasis was placed on the preservation of regimes. This accentuation is more

prevalent in Guicciardini's later works – who discarded Bartolus' distinctions between forms of tyranny (Marrara 1966) and stated that forms of government are to be valued only with regard to their “effects” – and to an even greater degree in the texts belonging to the genre of “Reason of State.” But such an emphasis on the conservation of regimes does not necessarily constitute a defense of unjust means and unlimited power. The view that a regime, and principally a monarchy, has to abide by the laws and, in so doing, is more likely to persevere is central to sixteenth-century thought, just as it was for Machiavelli. In *Discourses* I.58, he states that principalities and republics alike need laws in order to endure.

For medieval (Aristotelian) authors, adherence to the law was not the main criterion for discerning between good and corrupt forms of government. The best subtype of democracy, itself a corrupt form, was a law-abiding rule, and what defined monarchy and aristocracy was not that they were “constitutional” rules but that in such regimes men who excel others in virtue rule according to the inner law of “right reason.” During the sixteenth century, law became an increasingly important criterion for defining a good government. In many authors, it is still the divine and natural laws that work to restrain the ruler's action, which suggests a subjective element alone – the king's will – and not a formal system of control. Nevertheless, the increasing reliance on law as the century progressed is clear, and it is no coincidence that the expression “fundamental laws” of a regime emerges late in that century (it does not mean a set of laws in the fashion of a constitution, but an order anchored in the legal tradition). Authors also made substantial use of Roman law, and in particular of the *lex regia*, to argue for constraints to the ruler's power – one of the earliest examples is Mario Salamonio's *De principatu*, written between 1512 and 1514 (Straumann 2016, 256–259).

Two different ideas on the relationship between law and ruler come thus to the fore: on the one hand, the affirmation that the prerogative to enact laws pertains exclusively to the king; on the other, the emphasis on the idea that the king is solely a minister of the commonwealth and thus

that in addition to the ruler's power there is the need for effective institutions and procedures. The latter is reflected in the use sixteenth-century authors made of the "mixed regime" and also explains why it was so frequently applied.

The mixed regime, whether employed with regard to the republican regime or to monarchy, no longer represents the social classes – aristocracy denotes the patrician and the wealthy, while democracy signifies the plebs – but is deemed to contain the principles of the different forms of government. Moreover, it is used to state the importance of restraints on power and not so much to affirm popular government. The people's role is rather passive within the theory of the "mixed regime," and *popular government* and *popular sovereignty* should not be confused: it was the latter that was championed by the monarchomachs and their followers. This is evident in François Hotman's works, for whom monarchy has to be blended with aristocracy and democracy, and even more so in those of Claude de Seyssel, who used the "mixed regime" in his *Prohème en la translation de l'Histoire d'Appien* (1510), but not in his *Monarchie de France* (1515), where he instead maintained that the French monarchy needed aristocratic elements and restraints on kingly power. The affirmation with Polybian overtones that every simple form of government tends to degenerate, including the best form (monarchy), is still found in the monarchomachs. More specifically, elements associated with the mixed regime, such as parliament (which was equated with the aristocratic element) and the model of the ephors (seen as the democratic element) came to be widely used by French, Scottish, and English authors (Nippel 1980; for French authors, see Mellet 2007, 409–410, 454–460).

The ephors and other inferior magistrates were also used in the theories of resistance that had sprouted by the late sixteenth century. Although the treatises on the king's deposition employed the terms "tyrant" and "tyranny," the use of these categories had subsided over the course of the sixteenth century, and the contrast between monarchy and despotism instead moved to the fore. Authors increasingly emphasized that tyranny is a

rule imposed on free citizens (against their will) and that a tyrant does not want to be bound by the law. Despotism, on the other hand, is legitimate because it suits those inclined by nature to servitude, like the barbarians and primitive people. Following Aristotle, authors continued to associate despotism with the eastern kingdoms (and on occasion with the Turkish kingdom, as in Machiavelli). Such an association (still found in Bodin and Montesquieu) served as a negative model that permitted to contrast it with the European kingdoms, where citizens were free.

Impact and Legacy

The Aristotelian sixfold typology continued to be used after Machiavelli (for instance, by La Perrière, Louis Le Roy, and the authors of the "Reason of State"), but it was slowly replaced by a more restricted scheme of three main forms: monarchy, aristocracy, and democracy, precisely those that the majority of the authors thought constituted the "mixed regime." In the wake of Machiavelli, the distinction between good and corrupt forms started to fade away. This is evident in *Les six livres de la République* (Bodin 1576) of Bodin, for whom a regime is bad simply on account of the exercise of power. Bodin drops the category of "tyrant by usurpation": if we suppose that a ruler acquired his domain unlawfully, he could – after the expiration of the statute of limitations – become a perfectly legitimate ruler. For Hobbes, the meaningfulness of the distinction falls away because he considers the distinction between bad and good forms merely subjective (*De cive* VII.2, *Leviathan*, chapter 19).

The sixteenth-century emphasis on the rule of law finds a further development in Bodin. He locates sovereignty in the legislative power and not, as Aristotle did, in the capacity to allocate the magistracies, which is precisely what defines the state. Moreover, sovereignty cannot be shared because it is indivisible. This means that a "mixed regime" is a contradiction in terms, since the different factions have to share power, meaning that citizens would be at one and the same time both the sovereign and the subject. For Bodin,

Venice and the Holy Roman Empire are aristocracies, while Rome was a democracy. This idea came under attack chiefly in the Holy Roman Empire, and, despite Bodin, some authors continued to make use of the notion of “mixed regime” (Keckermann or Burgersdijk, for instance). Moreover, as noted earlier, it remained vital in English thought.

Aristotle’s teleology definitely died out: the regimes were no longer classified according to their purpose, and virtue – at least in the Classical sense – no longer played a role (Montesquieu’s virtue is rather different: it is a feeling, not a moral disposition). By contrast, the medieval and Renaissance view that the institution of a form of government was subject to the prevalent circumstances (climate, territory, or features of the population) and, therefore, that different forms are legitimate was still fully endorsed by Bodin and Montesquieu. This last point is arguably the most important legacy of how medieval and Renaissance authors conceived of the forms of government.

Grace in the Renaissance

Jordan J. Ballor

Acton Institute for the Study of Religion and Liberty, Grand Rapids, MI, USA

Abstract

Christian teaching on the nature of divine grace and its relationship to human activity is at the core of biblical revelation concerning the salvation of human beings. On the biblical account, humanity is fallen into sin and stands in need of divine aid. Grace is a term for describing this divine aid in its various manifestations. Grounded in the biblical and early church’s teachings about grace, the Middle Ages brought significant conceptual and doctrinal development, which in turn provided the background for continued dispute and development from the fourteenth through the seventeenth centuries. During the Reformation era, disputes over grace form a central feature of increasingly defined and identifiable confessional and ecclesial traditions. By the middle of the seventeenth century, clear confessional boundary lines have been established between

Roman Catholics, Lutherans, and Reformed traditions, in large part defined by their respective views of the relationship between divine grace and human choice.

Introduction

The Christian doctrines of grace (Latin, *gratia*; Greek, *charis*) were some of the most hotly contested teachings of the Renaissance era (1300–1650). Grace, understood in its most general sense, is divine blessing or favor. Controversy over the understanding of the relationship between human work and divine grace began in the apostolic period and carried through the Patristic era into the Middle Ages. In the late medieval and Reformation eras, these controversies became more developed in terms of their complexity, technicality, and nuance. In addition, positions became increasingly defined along the lines of particular ecclesiastical traditions and confessional communities.

The point of departure for debates over grace in Christian doctrine is usually the teaching of the apostle Paul, and particularly his epistle to the Romans. Paul opens his letter by distinguishing the righteousness of the Jews and that of non-Jews, or Gentiles. Even though Jews had the Mosaic law, and therefore a better understanding of what God's justice requires, Paul concludes "all, both Jews and Greeks, are under sin" (Rom 3:9 ESV). Because of the sinfulness of all humanity, divine grace is required for salvation from the consequences of this sin. As Paul puts it, "the wages of sin is death, but the free gift of God is eternal life in Christ Jesus our Lord" (Rom 6:23 ESV). One of Paul's primary concerns is to rightly distinguish between human work, which cannot merit eternal life, and the grace that imparts the perfect righteousness of Jesus Christ to human beings.

In one sense, this radically relativizes or devalues the role of human work in the divine plan of salvation. There are twin dangers that Paul's teaching is meant to combat, and these appear again and again in later debates over grace. The first is that of *works righteousness*,

that it is through human effort or work that salvation is achieved. Thus Paul writes, "one is justified by faith apart from works of the law" (Rom 3:28 ESV). A second error, however, is that works are so devalued and derogated that they are viewed as entirely dispensable. This is sometimes called *antinomianism*, from the Greek words for "against" and "law." If human beings are saved completely by divine grace which excludes human works in any and every sense, then there is no motivation to try to live in accordance with the law. "What shall we say then? Are we to continue in sin that grace may abound? By no means!" answers Paul (Rom 6:1–2 ESV).

This dynamic between human righteousness and divine grace would be at the core of later debates and controversy over salvation from sin. The church father Augustine of Hippo (354–480) opposed the teachings of Pelagius (c. 360–418), a British monk who was particularly concerned about licentiousness and lack of virtue among Christians. Pelagius taught that human beings were not affected by sin to such an extent that it was no longer possible for them to do good works worthy of eternal reward. The so-called Pelagian heresy became a watchword of all later theological discussions about grace in the Latin west, from the medieval period through the Renaissance and Reformation era.

Heritage and Rupture with the Tradition

Following the patristic era in the Christian west, Augustine's teachings functioned as the basic framework for diverse articulations of divine grace and its relation to human ability. There was great debate about what counted as truly faithful Augustinian teaching, but there was no significant dispute about the authority of the church father and his definitive orthodox opposition to the Pelagian heresy. Late medieval and Renaissance developments on the subject of grace are directly related to the inheritance of the medieval scholastics, so it is necessary to sketch some of these in brief before turning to the controversies of the fourteenth through the seventeenth centuries.

Grace in Medieval Scholastic Thought

The Cistercian abbot Bernard of Clairvaux (1090–1153) examined the relationship between divine grace and human action in a significant treatise, *On Grace and Free Choice* (*De gratia et libero arbitrio*) (Bernard of Clairvaux 1988). In this work, Bernard expounds a fundamentally Augustinian perspective through a framework that distinguishes the state of human beings before the fall into sin, after the fall into sin, in the state of redemption, and in the final state of glorification and consummation. This fourfold framework would continue to be influential for the framing of the question for centuries. For Bernard, humanity was able to sin or not sin before the fall. After the fall, human beings are unable to not sin. But in redemption, the possibility to not sin is again a reality in human life, while in the final consummation, glorified human beings will no longer be able to sin, which is understood as freedom in its highest sense.

The *Sentences* of Peter Lombard (1100–1160) which collated and organized opinions and teachings of the church fathers and other authorities on doctrinal topics was the standard theological text of the schools for more than a half millennium. In his exposition of the relationship between grace, free choice, and human nature, Lombard articulates a distinction between operating grace (*gratia operans*) and cooperating grace (*gratia cooperans*). Operating grace is a fully divinely caused grace that “prepares the will of man to will the good” (Lombard 2007, 2.XXVI.1.1, p. 123). Cooperating grace follows and “accompanies the will which is already good in order to aid it” (Lombard 2007, 2.XXVI.1.2, p. 123).

Following Lombard, major theologians who would exercise great influence on later developments include Bonaventure (1221–1274), Thomas Aquinas (1225–1274), and John Duns Scotus (c. 1266–1308). Bonaventure and Scotus were both Franciscans, meaning that they were members of a religious order founded in 1209 by Francis of Assisi (1181/1182–1226). Aquinas was a Dominican, an order founded by Dominic of Caleruega (1170–1221) in 1216. The Franciscans and the Dominicans would be two of the dominant schools of ecclesiastical order and theological

thought through the following centuries into the Renaissance.

Scholastic theologians typically wrote commentaries on Lombard’s *Sentences* as part of their academic training, and in this Bonaventure follows the standard route. Bonaventure is known for an integrative theological framework that unites reason and faith, nature and grace in a synthesis formed by divine illumination. After the fall into sin, human beings can merit nothing in an absolute sense of their own power (Cullen 2006, 157). But there is a sense in which according to God’s promise, human beings are able, after the work of operating grace, to perform works that are meritorious in a secondary sense. A key distinction here is between condign merit (*meritum de condigno*) and congruent merit (*meritum de congruo*). The former, condign merit, is a meritorious act performed on the basis of a more generalized divine grace, but within a framework of justice, something that does truly merit a reward on its own. Condign merit is truly and fully deserving of divine reward. The latter, congruent merit, by contrast, is rewarded not on the innate goodness or justice of the act but as a purely gratuitous act of divine mercy, which counts the action as meritorious that otherwise would not have of itself been fully meritorious.

Aquinas develops his theological work not only through his own *Sentences* commentary but also through his major work, the *Summa Theologiae*. Thomas’ *Summa* is organized in a format that under each topic introduces a series of questions that follow from one another. He first provides authorities and reasons for answering the question one way, then provides his own, different answer, and concludes by directly addressing the initial reasons. Thomas elaborates and develops in more detail the distinction between human beings in the natural, primal state before the fall into sin and the situation after the fall into sin. Thus, for instance, when answering “Whether man without grace and by his own natural powers can fulfil the commandments of the Law?” Aquinas writes that “man in the state of perfect nature could fulfil all the commandments of the Law.” However, after the fall into sin, “in the state of corrupted nature man cannot fulfil all the Divine commandments

without healing grace” (Aquinas 1920, I–II.109.4). Grace in its fullest sense is the infusion of virtue back into the life of the human being, a renewal of the power to do good that was originally granted in the primal state, and is understood in this sense as a divinely granted human quality.

The teaching of predestination is closely connected with the doctrines of grace, and an important distinction in this regard is whether God extends grace to those who have fallen into sin on the basis of some foreknown or foreseen quality of or work by that person or whether grace is given without regard to such merit. John Duns Scotus follows the main Augustinian trajectory on this question by denying that God predestines those to salvation on the basis of some foreseen merit (Cross 1999, 107). At the same time, however, Scotus does believe that works of congruent merit are achievable by those who have not yet been regenerated, and that on the basis of those works God deigns to freely and graciously grant the mercy of justifying and sanctifying grace, infusing the virtue of grace into the Christian. This distinction between the grace that is available and active in the state of sin, before conversion and regeneration, is a key dynamic in the late-medieval discussions of grace.

Innovative and Original Aspects

That grace which is understood to precede conversion, the change from the state of fallenness to that of redemption, is called prevenient grace (*gratia praeveniens*). That which follows conversion is subsequent grace (*gratia subsequens*). The nature of these types of grace formed the critical basis for discussion and debate from the fourteenth century onward. Prevenient grace could be understood in a general way as simply preparing the human being for the reception of operating and cooperating grace. This understanding of prevenient grace tended to emphasize the restoration of the human power of free choice to choose either good or evil after the fall into sin and before conversion. This prevenient grace could be resisted, however, and did not necessarily lead to restoration. Other versions of prevenient grace

understood it more as a divine action that inevitably restored a measure of rectitude to the human person on the basis of the merit of Jesus Christ. On the one account then, prevenient grace could be rightly or wrongly used, and on that basis God would either grant further, restorative grace or withhold it. On the other account, prevenient grace inevitably led to restoration, with an emphasis on divine initiative and intention rather than human responsiveness.

Late-Medieval and Early Renaissance Developments

While both emphases were present in the medieval tradition, in the later Middle Ages and Renaissance, the view that highlighted the freedom of human response to divine grace achieved a measure of dominance. The Franciscan theologian and philosopher William of Ockham (1287–1347) exercised significant influence and is often understood as the inaugurator of a new scholastic perspective, the so-called *via moderna*, in contrast to the *via antiqua* of Aquinas and Scotus. Whereas the older theologians affirmed the authentic extramental (i.e., outside of the mind) existence of universals in some way, the *via moderna* emphasized the human being’s subjective role in constructing an understanding of reality, and denied or deemphasized the objective, extramental nature of universals.

This approach, often identified as nominalism, was also associated with a soteriological perspective that was relatively optimistic about the capacities of fallen humanity to respond of its own accord and volition to the general, antecedent grace of God. For Ockham, the sacraments impart grace because God had willed them to function in this way. They were not means of grace because of any natural necessity, but simply because God, in his almighty power, ordained them as such (Wood 1999, 357). He could have done otherwise and indeed is not necessarily bound by anything other than his own good pleasure to follow the same course of action in the future.

Ockham is also known for affirming what is called *liberty of indifference* with respect to the relationship of soul’s faculties to human action (Adams 1999, 245). Specifically, this view holds

that the human will has the innate power to assent, deny, or remain indifferent to any particular end, regardless of the conclusions of the intellect or the inclinations of the passions. This view of the will has important implications for the relationship between grace and free choice, because to deny that the will has the power to choose between good and evil, or to refrain from choosing evil, would be to deny the will itself.

The connection between the *via moderna* and more optimistic perspectives of human nature in relation to divine grace is a tendency rather than a necessity, however. Gregory of Rimini (c. 1300–1358) was an Augustinian friar associated with the *via moderna* but whose views on nature and grace strongly emphasized the priority of divine action. He affirmed a strongly Augustinian view of predestination that excluded any divine consideration of human works, in contrast with his contemporary Ockham. Rimini is in this way noteworthy as defending the perspective that apart from special, divine grace no morally good or meritorious action is possible (Leff 1961, 183).

In later generations theologians like Pierre d'Ailly (1351–1420) and Gabriel Biel would (1420–1495) continue to explore and develop the late medieval stream of thought that on the one hand both emphasized the absolute power of God over against the created order, and on the other hand affirm the ability of human beings, through divine assistance, to merit divine blessing in some way.

An influential French scholastic and later cardinal of the church, d'Ailly largely followed in the tradition of Ockham in emphasizing the saliency of God's absolute power and the institutional and ordained status of the sacraments as means of grace (Lahey 2011, 515; Courtenay 1971, 110–111). The element holding together divine omnipotence and salvation of sinners is the divinely instituted covenant, which sets out particular signs and instruments of grace. The two most obvious of these are Baptism and the Lord's Supper, ordinances of the church that have been instituted by God to function as channels or ways of communicating grace to the church's members. Nominalists are often accused of affirming a capricious God, who might change his mind at

any moment or decide to no longer use the means he had previously ordained. But d'Ailly's covenantal perspective provides stability and coherence for his theological system, linking what God might do according to his absolute power and what he has deigned to do according to his ordained power (Courtenay 1971, 119). Stability and comfort are to be found in God's promises to dispense grace through the offices and powers of the church.

Gabriel Biel, because of his later significance for the thought of Martin Luther, was to be seen as perhaps the most influential theologian of the latter half of the fifteenth century. Biel was a nominalist, but one who appreciated the older, realist tradition and was able to synthesize these disparate traditions into a masterful theological system. The medieval formula "to do what is in you" (*facere quod in se est*) is typically associated with Biel, and it represents a perspective that emphasizes the divine covenant to grant grace to those who show their worthiness by manifesting what works are possible for them in the fallen state. Even though such works are not intrinsically and fully meritorious, according to God's covenantal promise to count them as worthy according to congruent merit, God will grant his grace to those who perform such works.

Such a position is not straightforwardly Pelagian because it does not affirm, for instance, that human works can be strictly meritorious, or that even those works that are counted as meritorious can be accomplished apart from the assistance of divine grace. But there is a clear departure in emphasis if not in substance from the more strongly Augustinian traditions in the church that speak clearly to the inability of sinful humanity to contribute anything positively toward their righteousness before God. Not only does Biel affirm such positive human activity, he also connects such action with divine predestination (Oberman 2000, 196). That is, God grants sufficient grace to those whom he has foreseen would respond properly to that gift and make appropriate use of it. On this view, God's predestination is not absolute or unconditioned by human factors but is rather in a significant way determined by it.

Impact and Legacy

Through the later middle ages, the *via moderna* developed an alternative account of reality, and with it came the rise of teachings concerning grace that increasingly emphasized human activity in response to and in preparation for the reception of divine grace. This was the situation at the turn of the sixteenth century and the flowering of even more diverse and heated controversy about grace.

The Reformation and Renaissance Humanism

The centrality of sacraments as channels of divine grace placed the church and its offices in a position of great importance in the economy of salvation. Beyond the seven sacraments of the church (baptism, chrismation, the Lord's Supper, confession, extreme unction, holy orders, and marriage), the practice of granting indulgences came to prominence in the medieval era. Technically an indulgence is the remission of the temporal punishments for a sin that has already been committed, confessed, and forgiven. This remission is granted on the basis of the treasury of merit that the church is entrusted with. There are various types and specifications for indulgences and the conditions for receiving them are manifold, but include the giving of alms, in some cases directly to the church.

The sale of indulgences helped to finance the construction of various ecclesiastical structures in the medieval and Renaissance era, including St. Peter's Basilica in Rome (Paulus 1922, 41). Perhaps the most infamous of the preachers of indulgences was the Dominican Johann Tetzel (1465–1519), who labored throughout Germany to raise funds for the construction of St. Peter's. Indulgence preaching of this type often went far beyond the carefully nuanced theological understanding of indulgences, and featured grandiose promises of spiritual delivery from even the grossest of sins (Mullett 1999, 41–43; Graham-Dixon 1999, 207–208).

The influence of this indulgence trade, along with his own experiences of late-medieval penance, led Martin Luther (1483–1546), a young Augustinian friar and professor at Wittenberg, to challenge the theological foundations and

practical applications of indulgences in his 95 *Theses* of 1517, published with the alternative title, *Disputation on the Power and Efficacy of Indulgences*. These were primarily intended for academic discussion, but Luther also sent the theses to church and governmental officials for feedback, and very quickly the debate expanded beyond the usual circles of academic debate. Luther's concerns over the theology of grace that was embedded in the sale of indulgences were varied, but they included both spiritual as well as material concerns. From Luther's perspective, the sale of indulgences created kind of spiritual bondage and made grace a commodity for sale, as laypersons were increasingly dependent on the church and its formal structures for any hope of comfort or assurance. Innovations like the indulgence trade served to further the material interests of the church at the expense of its members, who were impoverished both in their spiritual understanding of grace as well as in their material wealth.

In this way, Luther objected both to the abuse of indulgence preaching as well as its theological foundation on papal authority. Luther writes that “most people are necessarily deceived by that indiscriminate and high-sounding promise of release from penalty” (Thesis 24 in Luther 1955, 31:27), which speaks to the looseness of language used by preachers like Tetzel. At the same time, Luther sought to distinguish the proper use of indulgences, which he considered to be quite narrow indeed, from their more widespread abuse: “Christians are to be taught that if the pope knew the exactions of the indulgence preachers, he would rather that the basilica of St. Peter were burned to ashes than built up with the skin, flesh, and bones of his sheep” (Thesis 50 in Luther 1955, 31:30).

Luther's criticisms of indulgences quickly encompassed broader theological and ecclesiastical matters, including papal authority and the entirety of topics related to salvation (soteriology). At the same time, the point of departure for the Reformation really was focused particularly on discussions of divine grace: “It is worth recognizing from the outset that the Reformation altered comparatively few of the major *loci* of theology: the doctrines of

justification, the sacraments, and the church received the greatest emphasis, while the doctrines of God, the trinity, creation, providence, predestination, and the last things were taken over by the magisterial Reformation virtually without alteration” (Muller 2000, 39).

Even though humanists like Erasmus of Rotterdam (1466–1536) acknowledged that the church needed to be reformed in various ways, Luther’s increasingly strident challenges to the church’s teachings and papal authority occasioned significant controversy and alienated a number of otherwise sympathetic figures. A number of theologians took up the polemical cause against Luther, casting him as a brash heretic. Others questioned what they took to be Luther’s extreme views on the status of fallen human nature. A sharp dispute between Erasmus and Luther emerged in the 1520s over the doctrine of the human will and free choice. In 1524, Erasmus challenged Luther’s views in a treatise *On Free Choice* (*De libero arbitrio*). This marked a turning point in the Reformation era, as Erasmus, the preeminent humanist of his generation and who was otherwise disposed toward ecclesial reform, came out in public opposition to Luther, the foremost evangelical theologian of the time. The political as well as the theological implications of this clash were not lost on either party, as the anti-Lutheran elements within the church had been working for some time to enlist Erasmus to their cause (Nestingen 2005, 7). This confrontation dissolved some of the otherwise sympathetic and cooperative relations between those humanists who remained loyal to Rome and those reformers who joined with Luther (Rummel 2000, 9–39).

Erasmus’ 1524 treatise took up the question on Luther’s own terms, specifically the biblical witness concerning the question, as Luther disputed the authority of the church and its traditions to provide adequate warrant for proper doctrinal formulations. Erasmus seeks to cast the question whether human choice is bound or free in the state of sin as open, that is, underdetermined on the basis of scriptural witness alone. Once the weight of the church’s traditional teaching is added to the discussion, however, the argument to be decided in favor of understanding human

choice as Erasmus puts it, “a power of the human will by which man may be able to direct himself towards or turn away from what leads to eternal salvation” (Miller 2012, 6). As Erasmus puts it, “I would remind readers that if Luther and I seem to be evenly matched on the basis of scriptural testimonies and sound arguments, they should then take into consideration the long list of highly learned men approved by the consensus of very many centuries, all the way up to our own day, most of them commended by their exemplary lives as well as by their admirable learning in the Scriptures” (Miller 2012, 1).

Luther’s 1525 response to Erasmus, entitled *On Bound Choice* (*De servo arbitrio*), is thorough and wide-ranging, engaging Erasmus’ understanding of scripture, the authorities from church tradition and history, and human reason. In his conclusion, Luther declares victory over Erasmus’ argument, but praises him for taking on the matter of divine grace and free choice directly, and thereby having attacked the real issue, the essence of the matter in dispute. Likewise, says Luther, Erasmus has “not wearied me with irrelevancies about the papacy, purgatory, indulgences, and such like trifles (for trifles they are rather than basic issues), with which almost everyone hitherto has gone hunting for me without success. You and you alone have seen the question on which everything hinges, and have aimed at the vital spot” (Luther 1955, 33:294). Erasmus would continue to engage this key question in a two-part further response to Luther, appearing in 1526 and 1527, which finally and fully distinguished the position of the two on grace and free choice and which turned in large part on their differing views about the authority of the church to interpret and apply scripture.

Although Luther and Erasmus were perhaps the two most famous figures to debate these questions, their writings neither settled the issues nor exhausted the debates. Others, including the reformer of Geneva John Calvin (1509–1564) and the Dutch Roman Catholic theologian Albert Pighius (ca. 1490–1542) disputed these matters as well. Calvin treats free choice in his *Institutes of the Christian Religion*, which went through a number of editions in his lifetime. Pighius was

enlisted to respond to Calvin's treatment of the topic in the 1539 edition of the *Institutes*, and does so in a 1542 publication, *Ten Books on Human Free Choice and Divine Grace* (*De libero hominis arbitrio et divina gratia*), to which Calvin had responded by the following year (Calvin 1996, xiii–xiv).

A central point of this debate regards the status of prevenient grace as taught by the medieval church. For Pighius, prevenient grace serves as a preparatory aid by which a human being might freely choose the good and thereby merit the fuller gift of saving grace. For Calvin, prevenient grace is a unilateral divine gift that restores humanity through faith to a relationship with God: "Prevenient grace does not simply make it possible for people to respond. Grace is efficacious and effects conversion. This is true not just of the beginning of the Christian life. Grace is needed at every stage and, in particular, for final perseverance. This is a gift of God, not something that is merited by previous obedience" (Calvin 1996, xx).

By the middle of the sixteenth century, lines of interpretation of scripture and church tradition, particularly Augustine, had begun to more clearly emerge. The following generations continued to deepen and develop these understandings, increasingly along identifiable confessional and denominational lines. Protestants opposed Roman Catholics, but different Protestant confessions differed from one another on particular topics, and Roman Catholics differed as well from other Roman Catholics, often along the lines of church orders or theological traditions.

Confessionalization and Orthodoxy

The period from the mid-sixteenth century to the mid-seventeenth century is sometimes identified as a period of "confessionalization," in which different views of the church, papal authority, and doctrines like justification become codified in official doctrinal statements and are institutionalized in academies (Schilling 1992; Rummel 2000). Corresponding to the rise of confessional identity is the phenomenon of confessional orthodoxy. For the Protestants, this meant furthering and deepening the central claims of the Reformation. As Richard A. Muller writes, "the Protestant

orthodox held fast to these Reformation insights and to the confessional norms of Protestantism and, at the same time, moved toward the establishment of an entire body of 'right teaching' in continuity both with the Reformation and with the truths embodied in the whole tradition of Christian doctrine. They recognized that the claim of Protestantism to represent the church could be maintained only if the witness of the Reformation proved to be the key not only to the reform of a series of ecclesiastical abuses but also to the reformulation of the body of Christian doctrine." Contrasting the early and later eras, writes Muller, the "selectivity of the Reformation in its polemic had to be transcended in the direction of a reformed catholicity" (Muller 2003, 1:28).

On the Roman Catholic side, the Council of Trent (1545–1563) set the standard for the papal response to the Protestant Reformation and itself clarified, codified, and reformed official church teaching. Concerning the relationship of free choice and grace, the Council explicitly rejects Pelagian positions holding that human beings are able, whether easily or with difficulty, through the exercise of natural powers to merit salvation apart from divine grace. At the same time, the reality of free choice was affirmed. Canon IV on justification anathematizes the claim "that the free will of man moved and excited by God, by assenting to God exciting and calling, nowise co-operates to the end that it should dispose and prepare itself for obtaining the grace of justification" (Council of Trent 1851, 42–43). Similarly, Canon V, with a position like that of Luther in view, reads of one who holds that since the fall into sin that "the free will of man is lost an extinguished; or, that is a thing with a name only, yea, a title without a reality, a figment, in fine brought into the Church by Satan; let him be anathema" (Council of Trent 1851, 43). While the conclusions of the council would definitively anathematize Lutheran and Reformed articulations of grace, justification, and free choice, it would open up space for continuing intra-catholic disagreement.

The *de Auxiliis* controversy was a dispute between Dominicans and Jesuits in the latter half of the sixteenth century and into the seventeenth. The dispute centered around the role of free

choice in connection with divine foreknowledge and predestination. The Jesuit Luis de Molina (1535–1600) articulated a metaphysical grounding for divine predestination in the foreknowledge of future meritorious works. This “middle knowledge” (*scientia media*) was posited as God’s knowledge of what might occur in possible worlds that he did not choose to create. This kind of divine knowledge stood between or in the “middle” of God’s necessary knowledge and his free or contingent knowledge of that which he actually creates. This was a particularly controversial notion that came under consistent criticism by Dominican theologians, including Domingo Báñez (1528–1604). Against middle knowledge Báñez affirmed physical premotion, a prevenient gracious activity of God that worked through the nature of the human person (in accord with the Tridentine canons on free choice) to prepare and dispose a person towards the reception of justifying grace. The *de Auxiliis* controversy is properly understood as part of the longer trajectory of disputes over Augustine and the doctrines of grace, both between Protestants and Roman Catholics as within Roman Catholicism, as the later Jansenist controversy in the seventeenth century would echo many of the same themes (Matava 2016, 17–18).

If *de Auxiliis* was an intra-catholic controversy, the intra-Protestant differences between confessional Lutheran and Reformed views of grace, justification, sanctification, and perseverance also emerged in the latter half of the sixteenth century. The Formula of Concord, which expounded the orthodox Lutheran perspective in 1577, affirmed that “before man is illuminated, converted, reborn, renewed, and drawn by the Holy Spirit, he can do nothing in spiritual things of himself and by his own powers. In his own conversion or regeneration he can as little begin, effect, or cooperate in anything as a stone, a block, or a lump of clay could” (Tappert 1959, 525–526). Here we see a statement intended to oppose that of both the Decrees of Trent and that of the Reformed, who tended to affirm more clearly the reality of the human being *qua* human being

constituted by the faculty of the will in the course of regeneration as well as the grounding of both divine election and reprobation in God’s sovereign will. Moreover, where the Reformed affirmed final perseverance to glorification of those who are justified, Lutherans held that it was possible for those once in a state of grace to fall into condemnation and final judgment.

Reformed confessions, such as the Belgic Confession of 1561, affirmed that man fallen into sin “corrupted his whole nature; whereby he made himself liable to corporal and spiritual death. And being thus become wicked, perverse, and corrupt in all his ways, he has lost all his excellent gifts which he had received from God, and retained only small remains thereof, which, however, are sufficient to leave man without excuse” (Dennison 2008, 2:432). Likewise, the Reformed “reject all that is taught repugnant to this concerning the free will of man, since man is but a slave to sin” (Dennison 2008, 2:432). Among the Reformed as among the Roman Catholics, however, dispute arose as to the relationship between divine foreknowledge and human works. As Molina defended middle knowledge among the Jesuits, his teaching was influential on Protestants like Jacobus Arminius (1560–1609), a professor at the Reformed university in Leiden. Controversy over the development of Arminian theology rose to an international synod held in the Dutch city of Dordrecht in 1618–1619, which answered the points affirmed by the Remonstrance, a movement largely inspired by Arminius’ theology. The resulting Canons of Dort defined Reformed orthodoxy against Remonstrant theology, and affirmed the election of individuals to salvation without reference to human works, the definite application of Christ’s atoning work to the elect, the comprehensive corruption of humanity resulting from the fall into sin (as articulated in the Belgic Confession above, for example), the absolute efficacy of divine grace in justification, and the full and final perseverance of those justified to consummated glory.

Conclusion

Controversy over divine grace in the Renaissance and Reformation period grew out of longstanding debates over the role of human works and merit in salvation. These disagreements are fundamentally about issues relating to the witness of Scripture itself. The figure of Augustine looms large over all of these debates, from the medieval era onward. Distinctions made by medieval scholastics were taken over into the early modern period, and were variously affirmed, rejected, or refined according to the wisdom of those exploring the doctrines anew.

Disagreement about the nature of the human will and the faculty of free choice was central to ecclesiastical conflict in the early sixteenth century, and fueled the separation of Christendom into confessional parties. Similar dynamics were at play both between and among confessional groups, however. The Reformed and Dominicans emphasized and prioritized divine action in salvific work over against the Arminians and Jesuits, who defended a metaphysical understanding of human free choice as essential to right teaching concerning predestination, grace, and justification (Ballor et al. 2019). The Lutherans too viewed themselves as the legitimate heirs of Augustine's teachings on these matters, as they affirmed a clear disparity between the proximate causes of divine election and reprobation. While these disputes often generated more rhetoric than substance, clear lines of agreement and disagreement are visible. Likewise, amidst the conflict and the diversity of views, some boundaries are clarified and codified, such that even while the question of grace and human freedom might not have been settled in the Reformation and Renaissance eras, the doctrinal cause was undoubtedly advanced and developed.

Gravitas, Renaissance Concept of

Ivan Malara
Department of Philosophy, University of Milan,
Milan, Italy

Abstract

Traditionally, *gravitas* denotes the inner source of movement towards the center of the universe. In the mediaeval Latin tradition, the chief problem was to fit this notion within a coherent Aristotelian framework. As philosophers in the Renaissance begin to breach the constraints of Aristotelian natural philosophy, we see diverse attempts to conceive *gravitas* as a force also responsible for natural phenomena such as tides and free fall acceleration. The coexistence in the Renaissance of different Aristotelian and non-Aristotelian concepts of *gravitas* makes the latter a polysemic scientific term, whose meaning can be determined only after careful

examination of the context in which it was employed.

Heritage

According to a standard narrative, Aristotle held that heavy bodies fall because of their inner *gravitas*, i.e., weight or heaviness (Pedersen 1974, pp. 120–121; Grant 1996, pp. 60–61). This is a rough simplification. Against it, it may be argued that Aristotle never stated explicitly that downward movement is due to heaviness. This view is made explicit only in later understandings of Aristotle's natural philosophy.

Simplicius (490–560), commenting on the fourth book of the *De caelo*, calls heaviness (*barytes*) Aristotle's reference to the capacity or power (*dynamis*) of heavy bodies to move downwards, i.e., towards the center of the universe, which coincides with the center of the Earth. A body devoid of heaviness, e.g., fire, is incapable of natural movement downwards; hence heaviness, like nature (*physis*), is the source (*arche*) of natural movement in heavy bodies (Simplicius 1894, pp. 676.3–677.30; Simplicius 2009, pp. 67–69). This notion is also used by Simplicius to describe the different view of Plato: the latter, having relativized the meaning of “downward,” thought that all the elements, including fire, have weight (*baros*) in that their motion responds to a desire of like for like (*epheis ekaston pros ton syngenes*) carried by heaviness (*dia barytetos*) (Simplicius 1894, pp. 680.26–681.1; Simplicius 2009, p. 74). Every part has received from creation, or – as translated into Latin by William of Moerbeke (1215–1286) – from the creator, the power to return to its kindred whole, wherever god and nature decided it to be (Simplicius 1894, p. 695.3–5; Simplicius 2009, p. 90; Simplicius 1563, p. 241, col. 2). A 1000 years later, Copernicus (1473–1543) will advance a similar idea of *gravitas* in his *De revolutionibus* (1543) (Copernicus 1974, II, p. 17.29–33, although the resemblance with Simplicius's interpretation of Plato's doctrine has hitherto escaped the attention of Copernican scholars).

It is likely that the association of heaviness with the power of heavy bodies, and its causal involvement in downward movement, was not Simplicius's own fabrication. Probably, it was customary to hold similar interpretations. We can find this reading also in the Arabic reception of Aristotle (Cerami 2017, p. 315; Averroes 1550, p. 150r, col. 2), where the notions of weight (*wazn*) and heaviness (*thiq*) receive a further re-elaboration when related to statics (Rozhanskaya 1996, pp. 278–281; Abbattouy 2008, p. 102). In the mediaeval Latin tradition, the chief problem became to fit *gravitas* within a coherent Aristotelian framework. This gave rise to several issues. The attempts to solve them resulted in a rich array of views on *gravitas*, carefully recorded by Annaliese Maier (Maier 1943, pp. 143–180; Maier 1982, pp. 40–60).

Innovative and Original Aspects

The Renaissance philosopher Nicoletto Vernia (1420–1499) considered *gravitas* as “the most serious problem in natural philosophy” (Maier 1943, p. 143; De Bellis 2011, pp. 15–20). For Aristotelian thinkers like him, the issues at stake remained chiefly those already debated in the Middle Ages (Helbing 1989, pp. 154–157). Yet the views on *gravitas* received a further degree of terminological as well as conceptual detailing. The difference between the notions of weight (*pondus*) and *gravitas* was sometimes made explicit. Francesco Buonamici (1533–1603), for instance, thought of weight as due to the dynamic effect of *gravitas* (Buonamici 1591, p. 469B-D: “... Talis ergo est gravitas quam a pondere distinguimus...”), whose motive action (or secondary act) was by other authors expressed through the neologisms *gravitatio*, *gravitare*, or *actus gravitandi* (Helbing 1989, p. 155 n. 27; Galilei 1890–1909, I, pp. 131–132; Conimbricenses 1603, p. 530). In this sense, and in line with a passage of the fourth book of the *De caelo* (307b28–33), weight was often associated with *rhope*, a Greek term that in the Renaissance was translated also as *momentum* (Galluzzi 1979, pp. 89–118). The question of

gravitas began therefore to be treated in connection with the definition of *momentum* (Filalteo 1565, p. 594: “Graece *rhopen* placuit momentum vertere, alij propensionem, alij barbare nimis inclinationem. Censui animadvertendum hoc verbum ob gravem quaestionem, ne videlicet *gravitas*, et *levitas* sint formae et substantiae, an momenta, et facultates, potentiae elementorum...”).

As philosophers in the Renaissance begin to breach the constraints of Aristotelian natural philosophy, we see a new variety of positions on *gravitas*. Copernicus had a major role in this, for he challenged the traditional idea of *gravitas* as a unidirectional tendency towards the center of the universe, thereby providing preliminary conditions for a “decosmologized” analysis of movement (Clavelin 2016, pp. 80–84, 91–92). But Copernican philosophers were not always content with his definition of *gravitas*. Johannes Kepler (1571–1630), for instance, put forth different concepts of *gravitas* more or less indebted to the external effluvia theory advanced by William Gilbert (1544–1603) in the *De magnet* (1600) (Koyré 1965, pp. 173–175; Overmann 1974, pp. 31–53). He was then able to explain tides suggesting the existence of a mutual attraction between the Earth and the Moon. This solution was stigmatized as “occult” by another Copernican, Galileo Galilei (1564–1642), who was also convinced that the ontological understanding of *gravitas* had no bearing on the explanation of natural phenomena such as free fall motion (Galilei 1890–1909, VII, pp. 260–261, 486). But the majority of natural philosophers thought of it otherwise. Mechanical explanations of *gravitas* led some of them, like René Descartes (1596–1650), to the rejection of Galilei's law of free fall; whereas others, like Pierre Gassendi (1592–1655) and Thomas Hobbes (1588–1679), sought to develop theories in accordance with it (Palmerino 1999; Leijenhorst 2004; Baldin 2017, pp. 150–163). In any case, *gravitas* was no longer conceived as a natural capacity to accomplish an act but rather as a force (*vis*) more and more often associated with phenomena such as tides and free fall acceleration.

Legacy

By the second half of the seventeenth century, *gravitas* was related to a new number of issues. Above all, theories of *gravitas* were now required to rest on a more sophisticated quantitative approach. Christiaan Huygens (1629–1695) worked out a theory that, based on detailed mathematical analyses, was able to account for Galilei's law of free fall without exceeding the chief tenets of mechanical philosophy (Overmann 1974, pp. 152–175). After the publication of his theory in the *Horologium oscillatorium* (1673), qualitative attempts like those put forth by Robert Hooke (1635–1703), although suggestive, became insufficient (Koyré 1965, pp. 180–184; Overmann 1974, pp. 210–241). The definitive solution was provided by Isaac Newton (1642–1727). His law of universal gravitation explains a wide range of natural phenomena, both terrestrial and celestial. Because of this, its validity was granted notwithstanding skepticism about the ontological status of gravity as attractive force. Only more than two centuries after Newton's *Principia mathematica* (1687), the reformation of the classical mechanics space-time framework would cast serious doubts on the conceptualization of gravity as a force (Jammer 1957, pp. 260–264).

Theodoros Metochites (1270–1332). From the outbreak of the Hesychast controversy (around 1341) in Byzantium until his death, he was a staunch anti-Palamite. After becoming monk in 1351, he advanced to the position of a spiritual leader of the anti-Palamite movement. His most important work is his *Romaike Historia* (*Roman History*). He never wrote a treatise dedicated exclusively to philosophical subjects, but a number of his works contain extensive treatment of philosophical questions. In the dialogue *Phlorentios or on Wisdom*, he criticizes the syllogistic *techne* and discusses a number of issues pertaining to Aristotle’s natural philosophy.

Abstract

Nikephoros Gregoras was a Byzantine historian and philosopher. A native of Herakleia Pontike on the Black Sea, he moved to Constantinople at a very young age and received there his literary and philosophical education. He was a close friend of and later an intellectual heir to

Biography

Nikephoros Gregoras is a Byzantine polymath, philosopher, and historian. He was born between the summer of 1291 and May 1295 (Beyer 1978, pp. 127–130; Guiland 1926, 1927) in Herakleia Pontike (Karadeniz Ereğli in modern-day Turkey). Before the age of 20, G. moved to Constantinople (Beyer 1978, p. 130). There he received a literary and rhetorical education under Patriarch John XIII Glykys (1315–1319) (PLP 4271, cf. Schopen 1829/1830, I, 270, 20–271, 2) and became acquainted with the statesman, scholar, and patron of the arts Theodoros Metochites (PLP 17982). G. rapidly won Metochites’ confidence and was introduced by him to the study of astronomy and entrusted with the education of his children Nikephoros (PLP 17986) and Irene (PLP 5972). In 1321/1322 (van Dieten 1973/2007, I, 5; Beyer 1978, p. 131) G. was presented to the emperor Andronikos II Palaiologos (1282–1328) and quickly acquired a prominent status in the intellectual life of the Byzantine capital. Probably in the same year, the emperor offered G. the office of *chartophylax*, but G. declined the offer (Schopen 1829/1830, I, 339, 22–340, 10). In the following years G. opened a school (Bezdeki 1925, Ep. XXIII, 251, 42–252, 11) and went on a diplomatic mission to Serbia in 1326/1327 (Schreiner 1999/2000, pp. 334–335). After the deposition of Andronikos II by his grandson Andronikos III (1328–1341) on May 24, 1328,

G. found himself in a difficult situation on account of his close ties to both the deposed emperor and his prime minister Theodoros Metochites. G. was virtually banned from participation in the public life of the Byzantine capital. During the same period, G. got embroiled in the bitter dispute between G. and the scholar and theologian Barlaam of Calabria (ca. 1290–1348), which was made public in three pamphlets written by G. himself (“Reply to those who say that there is no humility among human beings,” “Philomates or on insolent people,” and the dialogue “Phlorentios or on wisdom”). G. eventually succeeded in winning the support and friendship of John Kantakouzenos (ca. 1295–1383), a figure of paramount importance in the new regime of Andronikos III and returned to play an important role in the intellectual life of Constantinople, without abandoning his allegiance to his old friends Andronikos II and Metochites. Following the death of Andronikos II on February 13, 1332, and of Metochites on March 13, 1332, G. continued his scholarly activities, residing in the Chora monastery, which Metochites had bequeathed to him. A new period of his life began with the civil war that broke out after the death of Andronikos III on June 15, 1341, and eventually led to the victory of his friend John Kantakouzenos. Kantakouzenos was crowned emperor in Thessalonike on May 21, 1346 and entered Constantinople on February 3, 1347. In the 1340s, G. got involved in the Hesychast controversy, and, after becoming a monk in 1351, he advanced to the position of the spiritual leader of the anti-Palamite movement. The struggle against the Palamites dominated almost all his activities during the last part of his life. After the death of Patriarch Isidore I Boucheras (PLP 3140), probably between 1350 and 1352, G. was offered the office of patriarch on the condition that he would join the Palamite camp, but he declined the offer. Owing to his uncompromising anti-Palamite stance, G. eventually lost the friendship and support of emperor John Kantakouzenos. In 1351 a synod convened by the emperor confirmed Palamas’ teachings and condemned G. In the summer of the same year, G. was placed under arrest in the Chora monastery. The conditions of his confinement became progressively more

adverse during the following 4 years of imprisonment: his servants were taken away from him, and he was denied any contact with the world outside his cell. After Kantakouzenos was forced by John V Palaiologos to abdicate on November 2, 1354, the decision about G.’s arrest was revoked. There is little information about the last years of G.’s life, during which he continued his fight against Palamite theology. Palamas died on November 14, 1357 or 1359 (PLP 21546, Beyer 1978, p. 150), and his enemy G. sometime later, most probably between 1358 and 1361 (Beyer 1978, pp. 153–155).

The most important work of Gregoras is his *Rhomaïke Historia* (Schopen 1829/1930), in 37 books, which covers the period 1204–1359 and presents the material in an annalistic fashion. His literary output was enormous, cf. the list in van Dieten (1973/2007, vol. I, pp. 44–62). It includes treatises on rhetorical, grammatical, musicological, astronomical, and mathematical subjects. G. maintained an extensive correspondence and engaged in doctrinal polemics. He did not author a single treatise dedicated exclusively to a philosophical subject, but a number of his works contain longer passages on philosophical questions. These are:

1. Commentary on Synesius of Cyrene’s *De insomniis* (= Nr. 39 van Dieten 1973/2007; ed. and it. tr. Pietrosanti 1999)
2. Pamphlet “Reply to those who say that there is no humility among human beings” (= Nr. 40 van Dieten 1973/2007; ed. Leone 1970, pp. 480–487)
3. Dialogue “Philomates or on insolent people” (= Nr. 41 van Dieten 1973/2007; ed. Bezdeki 1925, pp. 356–364)
4. Dialogue “Phlorentios or on Wisdom” (= Nr. 42 van Dieten 1973/2007; ed. Leone 1975)
5. Criticism of Senseless Prophecies (= Nr. 43a van Dieten, ed. Guiland 1927, pp. 73–83, written in 1329)
6. Letter to Pepagomenes (= Nr. 43b van Dieten 1973/2007; ed. Guiland 1927, pp. 201–205)
7. Letter to Maximos Magistros (= Nr. 43c van Dieten 1973/2007; ed. Guiland 1927, pp. 195–199)

8. Solutions to Different Problems Posed by Helena Palaiologina (= Nr. 44 van Dieten 1973/2007; ed. Leone 1970, pp. 488–513)
9. On the universal form by itself that is seen only by the Intellect (= Nr. 68a van Dieten 1973/2007; ed. Beyer 1971, p. 183)
10. On the form that is seen together with accidents (= Nr. 68b van Dieten 1973/2007; ed. Beyer 1971, p. 183)

The dialogue “Phlorentios or on Wisdom” offers important insights into G.’s philosophical views. Written sometime after the death of Theodoros Metochites, this text was intended by G. to be an account of a public debate on philosophical subjects between G., Barlaam of Calabria, and an otherwise unknown Latin friar that supposedly took place in the house of John Kantakouzenos. In spite of a quasi-documentary status that G. attributes to this text in his *Rhomaïke Historia* (Schopen 1829/1930, I, 555, 7–556, 14), it probably corresponds closer to what G. wished had happened than to the actual events (Bydén 2003; Mariev 2011; Tinnefeld 2011). In this dialogue, G. demonstrates that the syllogistic *technē* does not constitute science but is merely a tool for the preliminary instruction of weak and inexperienced minds. G.’s stance on the question concerning the status of logic is almost identical with the views expressed by Plotinus on the relationship between dialectic and logic in his treatise *On Dialectics* (Enn. I, 3, 1). Furthermore, G. demonstrates that neither the dialectical nor demonstrative syllogisms constitute science. In the case of the dialectical syllogisms, he points out that for Aristotle himself, their premises are merely “generally admitted” and “ambiguous.” His criticism of the demonstrative syllogisms pursues two objectives. First he shows that the demonstrative science is based on the principles which are not themselves demonstrated but are formulated on the basis of inductive reasoning which has as its starting point the observation of the sensible objects. At the same time, G. points out an inconsistency within Aristotle himself, who criticized the Platonic theory of forms and declared in *AnPo* I 83a 33–35 that the forms are irrelevant for demonstrations. The later part of the dialogue, which portrays a debate between G. and

a Latin friar, targets some points of Aristotle’s natural philosophy. It addresses such issues as which qualities should be assigned to each element and especially whether wetness should be assigned to water or air (Leone 1975, pp. 1060–1061); the question of the origin of large rivers, i.e., whether water is heavier than earth (Leone 1975, pp. 1251–1320); whether or not heaven is in a place (Leone 1975, pp. 1340–1358); and whether the element that constitutes heaven is corporeal or incorporeal (Leone 1975, pp. 1467–1497). The philosophical problems discussed in *Phlorentios* frequently resurface in other texts written by G. For example, his criticism of those who are not able to go beyond a merely discursive reasoning and consider syllogisms to be an art for its own sake is repeated in almost identical terms in G.’s *Letter to Pepagomenes* (Nr. 6 in the list above). G.’s interest in the status of universal concepts is documented in the two chapters “On the Universal Form” and “On the Form That Is Contemplated Together with Accidents.” Similarly, the discussion of various questions of natural philosophy reappears in his letters and in the *Romaïke Historia*. To a certain extent, G. can be considered a forerunner of the Renaissance in the West (Tatakis 1949, p. 295). G.’s philosophical questions show that he was an intellectual heir to Theodoros Metochites (Bydén 2011). His critical attitude toward logic can also be traced back to the early Church Fathers, such as Gregory of Nazianzus (329/30–ca. 390) and Gregory of Nyssa (between 335 and 340 – after 394), and finds interesting parallels in the writings of several of G.’s contemporaries and intellectual adversaries, such as Gregory Palamas and Barlaam of Calabria (Ierodiakonou 2003; Leone 1971/1972; Moschos 1998).
